O F  
A R T S, S C I E N C E S, &c.  
On a PLAN entirely New:

By WHICH,  
THE DIFFERENT SCIENCES AND ARTS  
Are digested into the Form of Distinct  
T R E A T I S E S O R S Y S T E M S,

COMPREHENDING  
The HISTORY, THEORY, and PRACTICE, of each,  
according to the Latest Discoveries and Improvements;  
AND FULL EXPLANATIONS ARE GIVEN OF THE  
VARIOUS DETACHED PARTS OF KNOWLEDGE,  
WHETHER RELATING TO  
NATURAL and ARTIFICIAL Objects, or to Matters ECCLESIASTICAL,  
CIVIL, MILITARY, COMMERCIAL, &c.

TOGETHER WITH  
A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, &c. throughout  
the World; a General HISTORY, *Ancient and Modern*, of the different Empires, Kingdoms,  
and States; and an Account of the LIVES of the most Eminent Persons in every Nation,  
from the earliest ages down to the present times.

THE WHOLE COMPILED FROM  
THE WRITINGS OF THE BEST AUTHORS, IN SEVERAL LANGUAGES; THE MOST APPROVED DICTIONARIES,  
AS WELL OF GENERAL SCIENCE AS OF PARTICULAR BRANCHES; THE TRANSACTIONS, JOURNALS, AND MEMOIRS, OF LEARNED  
SOCIETIES, BOTH AT HOME AND ABROAD; THE PRELECTIONS OF EMINENT PROFESSORS ON DIFFERENT SCIENCES;  
AND A VARIETY OF ORIGINAL MATERIALS, FURNISHED BY AN EXTENSIVE CORRESPONDENCE.

## K.

K  
||  
Kempferia.

**K**, the tenth letter, and seventh consonant, of our alphabet; being formed by the voice, by a guttural expression of the breadth through the mouth, together with a depression of the lower jaw and opening of the teeth.

Its sound is much the same with that of the hard *c*, or *qu*: and it is used, for the most part, only before *e*, *i*, and *n*, in the beginning of words; as *ken*, *kill*, *know*, &c. It used formerly to be always joined with *c* at the end of words, but is at present very properly omitted, at least in words derived from the Latin: thus, for *publick*, *musick*, &c. we say, *public*, *music*, &c. However, in monosyllables, it is still retained, as *jack*, *block*, *snock*, &c.

Though it is seldom used in words derived from the French, as being altogether wanting in that language, yet we meet with *risk*, *burlesk*, &c. in very good authors, instead of *risque*, *burlesque*; and indeed the former orthography is certainly most agreeable to the genius of the English language.

As a numeral, **K** denotes 250; and with a line over it, **K̄**, 250000.

**KEMPFERIA**, **GALANGAL**; a genus of the monogynia order, belonging to the monandria class of plants.

*Species*. 1. The galanga, or common galangal, hath tuberous, thick, oblong, fleshy roots; crowned with oval, close-fitting leaves, by pairs, four or five inches long, without footstalks; and between them close-fitting white flowers, with purple bottoms, growing singly. 2. The rotunda, or round zedoary, hath thick, fleshy, swelling, roundish, clustering roots, sending up spear-shaped leaves, six or eight inches long, near half as broad, on upright footstalks; and between them, immediately from the roots, rise whitish flowers, tinged with green, red, yellow, and purple, centres. Both these are perennial in root; but the leaves rise annually in spring, and decay in winter. They flower in summer: each flower is of one petal, tubulous below, but plain above, and divided into six parts; they continue three or four weeks in beauty, but are never succeeded by seeds in this country.

*Culture*. Both these plants must be potted in light rich mould, and always kept in the hot-house, giving in plenty of water in summer, but more sparingly in

winter. They are propagated by parting the roots Kalendar.  
spring, just before they begin to push forth new leaves.

*Uses*. The first species is cultivated with great care by the inhabitants of Siam for the sake of its root; the use of which, says Kempfer, is to remove obstructions of the hypochondria, to warm the stomach, discuss flatulencies, and to strengthen the bowels and the whole nervous system. The root was formerly used in this country in bitter infusions; but is now laid aside, on account of its flavour being disagreeable.

**KALENDAR**, a distribution of time, accommodated to the uses of life; or a table, or almanac, containing the order of days, weeks, months, seasons, &c. happening throughout the year. See **TIME**, **MONTH**, **YEAR**, &c.

It is called *kalendar*, from the word *kalendæ*, anciently wrote in large characters at the head of each month. See **KALENDS**.

The days in kalendars were originally divided into *octoades*, or eights; but afterwards, in imitation of the Jews, into *hebdomades*, or sevens; which custom, Scaliger observes, was not introduced among the Romans till after the time of Theodosius.

There are divers kalendars, according to the different forms of the year, and distributions of time, established in different countries. Hence the Roman, the Jewish, the Persian, the Julian, the Gregorian, &c. kalendars.

The ancient Roman kalendar is given by Ricciolus, Struvius, Danet, and others; by which we see the order and number of the Roman holidays and work-days.

The three Christian kalendars are given by Wolfius in his *Elements of Chronology*.

The Jewish kalendar was fixed by rabbi Hillel about the year 360, from which time the days of their year may be reduced to those of the Julian kalendar.

The *Roman KALENDAR*, owed its origin to Romulus; but it has undergone various reformations since his time. That legislator distributed time into several periods, for the use of the people under his command; but as he was much better versed in matters of war than of astronomy, he only divided the year into ten months, making it begin in the spring, on the first of March; imagining the sun made his course

Kalendar. thro' all the seasons in 304 days.

Romulus's kalendar was reformed by Numa, who added two months more; January and February; placing them before March: so that his year consisted of 355 days, and began on the first of January. He chose, however, in imitation of the Greeks, to make an intercalation of 45 days, which he divided into two parts; intercalating a month of 22 days at the end of each two years; and at the end of each two years more, another of 23 days; which month, thus interposed, he called *Marcedonius*, or the intercalary February.

But these intercalations being ill observed by the pontiffs, to whom Numa committed the care of them, occasioned great disorders in the constitution of the year; which Cæsar, as sovereign pontiff, endeavoured to remedy. To this end, he made choice of Sosigenes, a celebrated astronomer of those times; who found, that the dispensation of time in the kalendar could never be settled on any sure footing, without having regard to the annual course of the sun. Accordingly, as the sun's yearly course is performed in 365 days six hours, he reduced the year to the same number of days: the years of this correction of the kalendar was a year of confusion; they being obliged, in order to swallow up the 65 five days that had been imprudently added, and which occasioned the confusion, to add two months besides the *Marcedonius*, which chanced to fall out that year; so that this year consisted of 15 months, or 445 days. This reformation was made in the year of Rome 708, 42 or 43 years before Christ.

The Roman kalendar, called also *Julian kalendar*, from its reformer Julius, is disposed into quadriennial periods; whereof the first three years, which he called *communes*, consist of 365 days; and the fourth, *bissexile*, of 366; by reason of the six hours, which in four years make a day, or somewhat less, for in 134 years an intercalary day is to be retrenched. On this account it was, that pope Gregory XIII. with the advice of Clavius and Ciaconius, appointed, that the hundredth year of each century should have no bissexile, excepting in each fourth century: that is, a subtraction is made of three bissexile days in the space of four centuries; by reason of the 11 minutes wanting in the six hours whereof the bissexile consists.

The reformation of the kalendar, or the *new style*, as we call it, commenced on the fourth of October 1582, when ten days were thrown out at once; so many having been introduced into the computation since the time of the council of Nice, in 325, by the defect of 11 minutes.

*Julian Christian KALENDAR*, is that wherein the days of the week are determined by the letters A, B, C, D, E, F, G, by means of the solar cycle; and the new and full moons, especially the paschal full moon, with the feast of Easter, and the other moveable feasts depending thereon, by means of golden numbers, rightly disposed through the Julian year. See *CYCLE*, and *GOLDEN Number*.

In this kalendar, the vernal equinox is supposed to be fixed to the 21st day of March; and the cycle of 19 years, or the golden numbers, constantly to indicate the places of the new and full moons; yet both are erroneous. And hence arose a very great irregularity in

the time of Easter. To shew this error the more apparently, let us apply it to the year 1715. In this year, then, the vernal equinox falls on the tenth of March; and therefore comes too early by 11 days. The paschal full-moon falls on the 7th of April; and therefore too late, with regard to the cycle, by three days. Easter, therefore, which should have been on the 10th of April, was that year on the 17th. The error here lies only in the metempsychosis, or position of the moon, through the defect of the lunar cycle. If the full moon had fell on the 11th of March, Easter would have fallen on the 13th of March; and therefore the error arising from the anticipation of the equinox, would have exceedingly augmented that arising from the position. These errors, in course of time, were so multiplied, that the kalendar no longer exhibited any regular Easter. Pope Gregory XIII. therefore, by the advice of Aloysius Lilius, in 1582, threw 10 days out of the month of October, to restore the equinox to its place, viz. the 21st of March; and thus introduced the form of the Gregorian year, with such a provision, as that the equinox should be constantly kept to the 21st of March. The new moons and full moons, by advice of the same Lilius, were not to be indicated by golden numbers, but by epacts. The kalendar, however, was still retained in Britain, without this correction: whence there was a difference of 11 days between our time and that of our neighbours. But by 24 Geo. II. c. 23. the Gregorian computation is established here, and accordingly took place in 1752.

*Gregorian KALENDAR*, is that which, by means of epacts, rightly disposed thro' the several months, determines the new and full moons, and the time of Easter, with the moveable feasts depending thereon, in the Gregorian year.

The Gregorian kalendar, therefore, differs from the Julian, both in the form of the year; and in that epacts are substituted in lieu of golden numbers: for the use and disposition whereof, see *EPACT*, in the *APPENDIX*.

Though the Gregorian kalendar be preferable to the Julian, yet it is not without its defects (perhaps, as Tycho Brahe and Cassini imagine, it is impossible ever to bring the thing to a perfect justness.) For, first, the Gregorian intercalation does not hinder, but that the equinox sometimes succeeds the 21st of March, as far as the 23d; and sometimes anticipates it, falling on the 19th; and the full moon, which falls on the 20th of March, is sometimes the paschal; yet not so accounted by the Gregorians. On the other hand, the Gregorians account the full moon of the 22d of March, the paschal; which yet, falling before the equinox, is not paschal. In the first case, therefore, Easter is celebrated in an irregular month; in the latter, there are two Easters in the same ecclesiastical year. In like manner, the cyclical computation being founded on mean full-moons, which yet may precede or follow the true ones by some hours, the paschal full-moon may fall on Saturday, which is yet referred by the cycle to Sunday: whence, in the first case, Easter is celebrated eight days later than it should be; in the other, it is celebrated on the very day of the full moon, with the Jews and Quartodeciman heretics; contrary to the decree of the council of Nice. Scaliger and Calvisius shew other faults in the Gregorian kalendar, arising from the

Kalendar.

negligence and inadvertency of the authors: yet is this kalendar adhered to by the Romanists throughout Europe, &c. and used wherever the Roman breviary is used.

*Reformed, or Corrected, KALENDAR*, is that which, setting aside all apparatus of golden numbers, epacts, and dominical letters, determines the equinox, with the paschal full-moon, and the moveable feasts depending thereon, by astronomical computation, according to the Rudolphine Tables.

This kalendar was introduced among the Protestant states of Germany in the year 1700, when 11 days were at once thrown out of the month of February; so that in 1700, February had but 18 days: by this means, the corrected style agrees with the Gregorian. This alteration in the form of the year, they admitted for a time; in expectation that, the real quantity of the tropical year being at length more accurately determined by observation, the Romanists would agree with them on some more convenient intercalation.

*Construction of a KALENDAR, or Almanac.* 1. Compute the sun's and moon's place for each day of the year; or take them from ephemerides. 2. Find the dominical letter, and, by means thereof, distribute the kalendar into weeks. 3. Compute the time of Easter, and thence fix the other moveable feasts. 4. Add the immovable feasts, with the names of the martyrs. 5. To every day add the sun's and moon's place, with the rising and setting of each luminary; the length of day and night; the crepuscula, and the aspects of the planets. 6. Add, in the proper places, the chief phases of the moon, and the sun's entrance into the cardinal-points; *i. e.* the solstices and equinoxes; together with the kalends and the setting, especially heliacal, of the planets and chief fixed stars. See ASTRONOMY.

The duration of the crepuscula, or the end of the evening and beginning of the morning twilight, together with the sun's rising and setting, and the length of days, may be transferred from the kalendars of one year, into those of another; the differences in the several years being too small to be of any consideration in civil life.

Hence it appears, that the construction of a kalendar has nothing in it of mystery, or difficulty, if tables of the heavenly motions be at hand.

Some divide kalendars or almanacs into public and private, perfect and imperfect; others into heathen and Christian.

Public almanacs are those of a larger size, usually hung up for common or family use; private are those of a smaller kind, to be carried about either in the hand, inscribed on a staff, or in the pocket; perfect, those which have the dominical letters as well as primes and feasts inscribed on them; imperfect, those which have only the primes and immovable feasts. Till about the fourth century, they all carry the marks of heathenism; from that age to the seventh, they are generally divided between heathenism and Christianity.

Almanacs are of somewhat different composition, some containing more points, others fewer. The essential part is the kalendar of months and days, with the risings and setting of the sun, age of the moon, &c. To these are added various parerga, astronomical, astrological, meteorological, chronological, and even

political, rural, medical, &c. as calculations, and accounts of eclipses, solar ingresses, aspects, and configurations of the heavenly bodies, lunations, heliocentrical and geocentrical motions of the planets, prognostics of the weather, and predictions of other events, tables of the planetary motions, the tides, terms, interest, twilight, equation, kings, &c.

*Julian or Jellalaan KALENDAR*, is a correction of the Persian kalendar, made by order of sultan Gelaladdin, in the 467th year of the Hegira; of Christ 1089.

KALENDAR, is also applied to divers other compositions respecting the 12 months of the year.

In this sense, Spencer has given the shepherd's kalendar; Evelyn, and Miller, the gardener's kalendar, &c.

KALENDAR, is used for the catalogue, or fasti, anciently kept in each church, of the saints, both universal, and those particularly honoured in each church; with their bishops, martyrs, &c. Kalendars are not to be confounded with martyrologies; for each church had its peculiar kalendar, whereas the martyrologies regarded the whole church in general, containing the martyrs and confessors of all the churches. From all the several kalendars were formed one martyrology: so that martyrologies are posterior to kalendars.

KALENDAR, is also extended to an orderly table, or enumeration of persons or things.

Lord Bacon wishes for a kalendar of doubts. A late writer has given a kalendar of the persons who may inherit estates in fee-simple.

KALENDAR, *Kalendarium*, originally denoted among the Romans, a book containing an account of moneys at interest, which become due on the kalends of January, the usual time when the Roman usurers let out their money.

KALENDAR *Months*, the solar months, as they stand in the kalendar, viz. January 31 days, &c.

*Astronomical KALENDAR*, an instrument engraved upon copper-plates, printed on paper, and passed on board, with a brass slider which carries a hair, and shews by inspection the sun's meridian altitude, right ascension, declination, rising, setting, amplitude, &c. to a greater exactness than our common globes will shew.

KALENDAR of *Prisoners*. See CALENDAR.

KALENDAR-*Brothers*, a sort of devout fraternities, composed of ecclesiastics as well as lay-men; whose chief business was to procure masses to be said, and alms distributed, for the souls of such members as were deceased. They were also denominated *kalend-brothers*, because they usually met on the kalends of each month, though in some places only once a quarter.

KALENDAR<sup>UM</sup> *FESTUM*. The Christians retained much of the ceremony and wantonness of the kalends of January, which for many ages was held a feast, and celebrated by the clergy with great indecencies, under the names *festum kalendarum*, or *hypodiakonorum*, or *sultorum*, that is, the feast of fools: sometimes also *libertas decembrica*. The people met masked in the church; and in a ludicrous way proceeded to the election of a mock pope, or bishop, who exercised a jurisdiction over them suitable to the festivity of the occasion. Fathers, councils, and popes, long laboured to restrain this licence, to little purpose. We find the

Kalendar, Kalendarium.

Kalenders. the feast of the kalends in use as low as the clofe of the 15th century. Du Cange.

KALENDERS. See CALENDERS.

KALENDS, or CALENDS, in the Roman chronology, the first day of every month.—The word is formed from *calare*, I call, or proclaim; becaufe, before the publication of the Roman fasti, it was one of the offices of the pontifices to watch the appearance of the new moon, and give notice thereof to the *rex sacrficulus*; upon which a sacrifice being offered, the pontiff summoned the people together in the capitol, and there, with a loud voice, proclaimed the number of kalends, or the day whereon the nones would be; which he did by repeating this formula, as often as there were days of kalends, *Calo Juno Novella*. Whence the name *calende* was given thereto, from *calo*, *calare*. This is the account given by Varro. Others derive the appellation hence, That the people being convened on this day, the pontifex called, or proclaimed, the several feasts or holidays in the month; a custom which continued no longer than the year of Rome 450, when C. Flavius, the curule ædile, ordered the fasti, or kalendar, to be set up in public places, that every body might know the difference of times, and the return of the festivals.

The kalends were reckoned backwards, or in a retrograde order. Thus, v. g. the first of May being the kalends of May; the last, or 30th of April, was the *pridie kalendarum*, or second of the kalends of May; the 29th of April, the third of the kalends, or before the kalends: and so back to the 13th, where the ides commence; which are, likewise, numbered invertedly to the fifth, where the nones begin; which are numbered after the same manner to the first day of the month, which is the kalends of April. See IDES, and NONES.

The rules of computation by kalends, are included in the following verses:

*Prima dies mensis cujusque est dicta kalendæ:  
Sex Maius nonas, October, Julius, & Mars;  
Quatuor at reliqui: habet idus quilibet octo.  
Inde dies reliquos omnes dic esse kalendas;  
Quas retro numerans dicet a mense sequente.*

To find the day of the kalends answering to any day of the month we are in; see how many days there are yet remaining of the month, and to that number add two: for example, suppose it the 22d day of April; it is then the 10th of the kalends of May. For April contains 30 days; and 22 taken from 30, there remains eight; to which two being added, the sum is ten. The reason of adding two is, becaufe the last day of the month is called *secundo kalendas*, the last but one *tertio kalendas*, &c.

The Roman writers themselves are at a loss for the reason of this absurd and whimsical manner of computing the days of the month: yet it is still kept up in the Roman chancery; and by some authors, out of a vain affectation of learning, preferred to the common, more natural, and easy manner.

KALENDS, are also used in church-history to denote conferences anciently held by the clergy of each deanry, on the first day of every month, concerning their duty and conduct, especially in what related to the imposition of penance.

KALENDS of January, in Roman antiquity, was a

solemn festival consecrated to Juno and Janus; where, in the Romans offered vows and sacrifices to those deities, and exchanged presents among themselves, as a token of friendship.

It was only a melancholy day to debtors, who were then obliged to pay their interests, &c. Hence Horace calls it *tristes kalendæ*; Lib. i. Scrm. Sat. 3.

KALI, in botany. See SALSOLA.

KALISH, a province of Lower Poland, with the title of a palatinate. It is bounded on the west by the palatinate of Bofnia, on the east by that of Syrad, on the north by Regal Prussia, and on the south by Silesia. Kalish is the capital town.

KALISH, a town of Lower Poland, and capital of a palatinate of the same name, where the jesuits have a magnificent college. It is seated on the river Protna, in a morass, which renders it difficult of access. E. Long. 18. o. N. Lat. 52. 20.

KALMIA, in botany, a genus of the monogynia order, belonging to the decandria class of plants. Of this genus there are two species; both of them hardy evergreen shrubs, growing four or five feet high; adorned with oval and spear-shaped entire leaves, and monopetalous five-parted flowers, of a pale or bright red colour, in close round bunches, appearing in June and July. They may be propagated either by seeds, suckers, or layers; and though natives of America, will succeed any where in the open ground in this country.

KALMUCKS, a tribe of Tartars, called also *E-luths*, inhabiting the larger half of what the Europeans call *Western Tartary*. Their territory extends from the Caspian sea, and the river *Yaik* or *Ural*, in 72 degrees of longitude from Ferro, to mount Altay, in 110 degrees, and from the 40th to the 52d degree of north latitude; whence it may be computed about 1930 miles in length from west to east, and in breadth from north to south about 650 miles where broadest. It is bounded on the north by Russia and Siberia, from which it is separated by a chain of mountains; on the east by mount Altay; on the south by the countries of Karazm and the two Bukharias, from which it is also separated partly by a chain of mountains, and partly by some rivers.—For a description of the country, the manners, &c. of the inhabitants, see TARTARY.

KAMAKURA, a famous island of Japan, about three miles in circumference, lying on the south coast of Niphon. It is here they confine their great men when they have committed any fault. The coast of this island is so steep, that they are forced to be lifted up by cranes.

KAMINIECK, a very strong town of Poland, and capital of Podolia, with two castles, and a bishop's see. It was taken by the Turks in 1672, who gave it back in 1690, after the treaty of Carlowitz. It is seated on a craggy rock, in E. Long. 27. 30. N. Lat. 48. 58.

KAMTCHATKA, KAMSCHATKA, or *Kamchatka*; a large peninsula on the north-eastern part of Asia, lying between 51 and 62 degrees of north latitude, and between 173 and 182 degrees of east longitude from the isle of Ferro. It is bounded on the east and south by the sea of Kamtschatka, on the west by the seas of Ochotsk and Penhsink, and on the

Kalends  
Kamchatka

Kamchatka the north by the country of the Koriaks.

<sup>1</sup> This peninsula was not discovered by the Russians before the end of the last century. It is probable, however, that some of that nation had visited Kamchatka before the time above mentioned. For when Volodimir Atlaſſoff entered upon the conquest of this peninsula in 1697, he found that the inhabitants had already some knowledge of the Russians. A common tradition as yet prevails among them, that, long before the expedition of Atlaſſoff, one Feodotoff and his companions had resided among them, and had intermarried with the natives; and they still shew the place where the Russian habitations stood. None of the Russians remained when Atlaſſoff first visited Kamchatka. They are said to have been held in great veneration, and almost deified, by the natives; who at first imagined that no human power could hurt them, until they quarrelled among themselves, and the blood was seen to flow from the wounds which they gave each other; and soon after, upon a separation taking place, they were all killed by the natives. — These Russians were thought to be the remains of a ship's crew who had failed quite round the north-eastern promontory of Asia called *Tschukotkoi-Nefs*. The account we have of this voyage is as follows. — In 1648, seven ketches or vessels sailed from the mouth of the river *Koyma* or *Kolyma*, lying in the frozen ocean in about 72 degrees north latitude, and 173 or 174 east longitude from Ferro, in order to penetrate into the eastern ocean. Four of these were never more heard of; the remaining three were commanded by Simon Deshneff, Gerasim Ankudinoff, two chiefs of the Cossacs, and Feodotoff Alexeeff, head of the Promyshlennics, or wandering Russians, who occasionally visited Siberia. Each vessel was probably manned with about 30 persons. They met with no obstructions from the ice, but Ankudinoff's vessel was wrecked on the promontory above mentioned, and the crew were distributed on board the two remaining vessels. These two soon after lost sight of each other, and never afterwards rejoined. Deshneff was driven about by tempestuous winds till October, when he was shipwrecked on the northern part of Kamchatka. Here he was informed by a woman of Yakutsk, that Feodotoff and Gerasim had died of the scurvy; that part of the crew had been slain; and that a few had escaped in small vessels, who had never afterwards been heard off; and these were probably the people who, as we have already mentioned, settled among the Kamchatkans.

<sup>2</sup> Subdued by them. As the inhabitants of this country were neither numerous nor warlike, it required no great force to subdue them; and in 1711 the whole peninsula was finally reduced under the dominion of the Russians. — For some years this acquisition was of very little consequence to the crown, excepting the small tribute of furs exacted from the inhabitants. The Russians indeed occasionally hunted, in this peninsula, foxes, wolves, ermines, fables, and other animals, whose skins form an extensive article of commerce among the eastern nations. But the fur-trade carried on from thence was very inconsiderable, until the series of islands mentioned in the next article were discovered; since which time the quantities of furs brought from these islands have greatly increased the trade of Kam-

chatka, and rendered it an important part of the Russian commerce.

The face of the country throughout the peninsula is chiefly mountainous. It produces, in some parts, birch, poplars, elders, willows, underwood, and berries of different sorts. Greens and other vegetables are raised with great facility; such as white cabbage, turneps, radishes, beet-root, carrots, and some cucumbers. Agriculture is in a very low state; owing chiefly to the nature of the soil and the severe frosts: for though some trials have been made with respect to the cultivation of grain; and oats, barley, and rye, have been sown; yet no crop has ever been procured sufficient in quantity or quality to answer the trouble of raising it. Hemp, however, has of late years been cultivated with great success. — Every year a vessel belonging to the crown sails from Ochotsk to Kamchatka laden with salt, provisions, corn, and Russian manufactures; and returns in June or July of the following year with skins and furs.

Many traces of volcanoes have been observed in this peninsula; and there are some mountains which are in a burning state at present. The most considerable of these is situated near the middle of the peninsula. In 1762, a great noise was heard issuing from the inside of that mountain, and flames of fire were seen to burst from different parts. These flames were immediately succeeded by a large stream of melted snow-water, which flowed into the neighbouring valley, and drowned two natives who were there on a hunting party. The ashes and burning matters thrown from the mountain were spread over a surface of 300 versts. In 1767, was another discharge, but less considerable. Every night flames of fire were observed streaming from the mountain; and considerable damage was done by the eruption which attended them. Since that year no flames have been seen; but the mountain emits a constant smoke.

Kamchatka is divided by the Russians into four districts; and the government of the whole is dependent upon, and subject to, the inspection of the chancery of Ochotsk. The whole Russian force stationed in this peninsula, amounts to no more than 300 men. The present population of Kamchatka is very small, amounting to scarce 4000 souls. Formerly the inhabitants were more numerous; but in 1768, the small-pox carried off 5368 persons. There are now only about 700 males in the whole peninsula who are tributary, and few more than 100 in the neighbouring islands, called the *Kuril Isles*, who are subject to Russia. The fixed annual tribute consists in 279 fables, 464 red foxes, 50 sea-otters with a dam, and 38 cub otters. All furs exported from Kamchatka pay a duty of 10 per cent. to the crown; the tenth part of the cargoes bought from the neighbouring islands is also delivered into the customs.

The natives of Kamchatka are as wild as the count-try itself. Some of them have no fixed habitations, but wander from place to place, with their herds of rein-deer; others have settled habitations, and reside upon the banks of the rivers, and the shore of the Penschinsk sea, living upon fish and sea-animals, and such herbs as grow upon the shore: the former dwell in huts, covered with deer-skins; the latter in places dug out of the earth; both in a very barbarous manner.

Kamchatka ner. Their dispositions and tempers are rough; and they are entirely ignorant of letters or religion. The natives are divided into three different people, namely, the Kamchatkans, Koreki, and Kuriles. The Kamchatkans live upon the fourth side of the promontory of Kamchatka: the Koreki inhabit the northern parts on the coast of the Penchinka sea, and round the eastern ocean, almost to the river Anadir, whose mouth lies in that ocean almost in 68° N. Lat.: the Kuriles inhabit the islands in that sea, reaching as far as those of Japan. The Kamchatkans have this particular custom, that they endeavour to give every thing a name in their language which may express the property of it; but if they do not understand the thing quite well themselves, then they take a name from some foreign language, which perhaps has no relation to the thing itself; as, for example, they call a priest *begbeg*, because probably they hear him use the word *begbeg*, God; bread they call *brightatin augb*, that is, Russian root; and thus of several other words to which their language is a stranger.

It appears probable, that the Kamchatkans lived formerly in Muanglia, beyond the river Amur, and made one people with the Mungals; which is farther confirmed by the following observations, such as the Kamchatkan having several words common to the Munggal Chinese language, as their terminations in ong, ing, oang, chin, cha, ching, kfi, kfung; it would be still a greater proof, if we could hear several words and sentences the same in both languages. The Kamchatkans and Mungals also are both of a middling stature, are swarthy, have black hair, a broad face, a sharp nose, with the eyes falling in, eye-brows small and thin, a hanging belly, slender legs and arms; they are both remarkable for cowardice, boasting, and slavishness to people who use them hard, and for their obstinacy and contempt of those who treat them with gentleness.

Although, in outward appearance, they resemble the other inhabitants of Siberia, yet the Kamchatkans differ in this, that their faces are not so long as the other Siberians; their cheeks stand more out, their teeth are thick, their mouth large, their stature middling, and their shoulders broad, particularly those people who inhabit the sea-coast.

Before the Russian conquest, they lived in perfect freedom, having no chief, being subject to no law, nor paying any taxes; the old men, or those who were remarkable for their bravery, bearing the principal authority in their villages, though none had any right to command or inflict punishment.

Their manner of living is slovenly to the last degree: they never wash their hands nor face, nor cut their nails; they eat out of the same dish with the dogs, which they never wash; they never comb their heads, but both men and women plait their hair in two locks, binding the ends with small ropes. When any hair starts out, they sew it with threads to make it lie close; by this means they have such a quantity of lice, that they can scrape them off by handfuls, and they are nasty enough even to eat them. Those that have not natural hair sufficient, wear false locks, sometimes as much as weigh ten pounds, which makes their heads look like a haycock.

They place their chief happiness in idleness, and

satisfying their natural lust and appetites; which incline them to singing, dancing, and relating of love-stories; and they think it more eligible to die than to lead a disagreeable life; which opinion often leads them to self-murder. This was so common after the conquest, that the Russians had great difficulty to put a stop to it. They have no notion of riches, fame, or honour; therefore covetousness, ambition, and pride, are unknown among them. On the other hand, they are careles, lustful, and cruel: these vices occasion frequent quarrels and wars among them, sometimes with their neighbours, not from a desire of increasing their power, but from some other causes; such as the carrying off their provisions, or rather their girls, which is frequently practised as the most summary method of procuring a wife. Their trade is almost entirely confined to procuring the immediate necessities and conveniences of life. They sell the Koreki fables, fox and white dog skins, dried mushrooms, and the like, in exchange for cloaths made of deer-skins and other hides. Their domestic trade consists in dogs, boats, dishes, troughs, nets, hemp, yarn, and provisions; and this kind of barter is carried on under a great show of friendship; for when one wants any thing that another has, he goes freely to visit him, and without any ceremony makes known his wants, although perhaps he never had any acquaintance with him before: the host is obliged to behave according to the custom of the country, and give his guest what he has occasion for; but he may afterwards return the visit, and must be received in the same manner. They fill almost every place in heaven and earth with different spirits, and offer them sacrifices upon every occasion. Some carry little idols about them, or have them placed in their dwellings; but, with regard to God, they not only neglect to worship him, but, in case of troubles and misfortunes, they curse and blaspheme him.

It is very diverting to see them attempt to reckon above ten: for having reckoned the fingers of both hands, they clasp them together, which signifies ten; then they begin with their toes, and count to twenty; after which they are quite confounded, and cry, Metcha? that is, Where shall I take more? They reckon ten months in the year, some of which are longer and some shorter; for they do not divide them by the changes of the moon, but by the order of particular occurrences that happen in those regions. They commonly divide our year into two, so that winter is one year, and summer another: the summer year begins in May, and the winter in November. They do not distinguish the days by any particular appellation, nor form them into weeks or months, nor yet know how many days are in the month or year. They mark their epochs by some remarkable thing or other, such as the arrival of the Russians, or the first expedition to Kamchatka.

If any one kills another, he is to be killed by the relations of the person slain. They burn the hands of people who have been frequently caught in theft; but, for the first offence, the thief must restore what he hath stolen, and live alone in solitude, without expecting the assistance of others. They never have any disputes about their land, or their huts, every one having land and water more than sufficient for his wants.

They

Kamchatka

They think themselves the happiest people in the world, and look upon the Russians who are settled among them with contempt. However, this notion begins to change; for the old people, who are confined in their customs, drop off, and the young ones, being converted to the Christian religion, adopt the customs of the Russians, and despise the barbarity and superstition of their ancestors.

In every *otlog*, or large village, by order of her imperial majesty, is appointed a chief, who is sole judge in all causes, except those of life and death; and not only these chiefs, but even the common people, have their chapels for worship. Schools are also erected in almost every village, to which the Kamchatkans send their children with great pleasure: by this means it is to be hoped, that barbarity will be in a short time rooted out from amongst them.

10  
Manner of  
building  
their huts.

Under the name of *otlog*, is understood every habitation consisting of one or more huts, all surrounded by an earthen wall or palisado.—The huts are built in the following manner: they dig a hole in the earth about five feet deep, the breadth and length proportioned to the number of people designed to live in it. In the middle of this hole they plant four thick wooden pillars; over these they lay balks, upon which they form the roof or ceiling, leaving in the middle a square opening which serves them for a window and chimney; this they cover with grass and earth, so that the outward appearance is like a round hillock; but within they are an oblong square, with the fire in one of the long sides of the square: between the pillars, round the walls of their huts, they make benches, upon which each family lies separately; but on that side opposite to the fire, there are no benches, it being designed for their kitchen-furniture, in which they dress their viands for themselves and dogs. In those huts where there are no benches, there are balks laid upon the floor, and covered with mats. They adorn the walls of their huts with mats made of grass. They enter their huts by ladders, commonly placed near the fire-hearth; so that, when they are heating their huts, the steps of the ladder become so hot, and the smoke so thick, that it is almost impossible for a stranger to go up or down without being burnt, and even stifled to death; but the natives find no difficulty in it; and though they can only fix their toes on the steps of the ladder, they mount like squirrels; nor do the women hesitate to go through this smoke with their children upon their shoulders, though there is another opening through which the women are allowed to pass; but if any man pretend to do the same, he would be laughed at. The Kamchatkans live in these huts all the winter, after which they go into others called *balagans*: these serve them not only to live in during the summer, but also for magazines. They are made in the following manner: nine pillars, about two fathoms long, or more, are fixed in the ground, and bound together with balks laid over them, which they cover with rods, and over all lay grass, fastening spars, and a round sharp roof at top, which they cover with bramble, and thatch with grass. They fasten the lower ends of the spars to the balks with ropes and thongs, and have a door on each side, one directly opposite to the other. They make use of the same kind of huts to keep their fish, &c. till winter

Vol. VI.

Kamchatka

comes on, when they can more easily remove it; and this without any guard, only taking away the ladders. If these buildings were not so high, the wild beasts would undoubtedly plunder them; for, notwithstanding all their precaution, the bears sometimes climb up and force their way into their magazines, especially in the harvest, when the fish and berries begin to grow scarce.

The southern Kamchatkans commonly build their villages in thick woods, and other places which are naturally strong, not less than 20 versts from the sea; and their summer habitations are near the mouths of the rivers; but those who live upon the Penchinskia sea, and the eastern ocean, build their villages very near the shore. They look upon that river near which their village is situated, as the inheritance of their tribe.

17  
Method of  
kindling  
fire.

In order to kindle fire, they use a board of dry wood with round holes in the sides of it, and a small round stick; this they rub in a hole till it takes fire; and instead of tinder they use dry grass beat soft. These instruments are held in such esteem by the Kamchatkans, that they are never without them, and they value them more than our steels and flints; but they are excessively fond of iron instruments, such as hatchets, knives, or needles: nay, at the first arrival of the Russians, a piece of broken iron was looked upon as a great present; and even now they receive it with thankfulness, finding use for the least fragment, either to point their arrows or make darts, which they do by hammering it out cold between two stones. As some of them delight in war, the Russian merchants are forbid to sell them any warlike instruments: but they are ingenious enough to make spears and arrows out of the iron pots and kettles which they buy; and they are so dexterous, when the eye of a needle breaks, as to make a new eye, which they will repeat until nothing remains but the point.

18  
Construction of their  
boats.

The Kamchatkans make their boats of poplar-wood; but the Kuriles, not having any wood of their own, make use of what is thrown on shore by the sea, and is supposed to come from the coasts of Japan, China, or America. The northern inhabitants of Kamchatka, the settled Koreki and Tschukotkoi, for want of proper timber and plank, make their boats of the skins of sea-animals. They sew the pieces together with whales beards, and caulk them with moss or nettles beat small. These boats hold two persons; one of which sits in the prow, and the other in the stern. They push them against the stream with poles, which is attended with great trouble: when the current is strong, they can scarcely advance two feet in ten minutes; notwithstanding which, they will carry the boats, fully loaded, sometimes 20 versts, and, when the stream is not very strong, even 30 or 40 versts. The larger boats carry 30 or 40 poud; when the goods are not very heavy, they lay them upon a float or bridge resting upon two boats joined together. They use this method in transporting their provisions down the stream, and also to and from the islands.

19  
Of their  
clothes.

Their cloaths, for the most part, are made of the skins of deer, dogs, several sea and land animals, and even of the skins of birds, those of different animals being frequently joined in the same garment. They

22 U

make

make the upper garment after two fashions; sometimes cutting the skirts all of an equal length, and sometimes leaving them long behind in form of a train, with wide sleeves of a length to come down below the knee, and a hood or caul behind, which in bad weather they put over their heads below their caps; the opening above is only large enough to let their heads pass: they sew the skins of dogs feet round this opening, with which they cover their faces in cold stormy weather; and round their skirts and sleeves they put a border of white dog-skin; upon their backs they sew the small strands of skins of different colours. They commonly wear two coats; the under coat with the hair side inwards, the other side being dyed with alder; and the upper with the hair outwards. For the upper garment they choose black, white, or speckled skins, the hair of which is most esteemed for the beauty of its colour.

Men and women, without distinction, use the above-mentioned garments, their dress only differing in their under-clothing and in the covering of their feet and legs. The women have an under-garment, which they commonly wear at home in the house, consisting of a breeches and waistcoat sewed together. The breeches are wide, like those of the Dutch skippers, and tie below the knee; the waistcoat is wide above, and drawn round with a string. The summer habits are made of dressed skins without hair; their winter-garment is made of deer or stone-ram skins with the hair on. The undress or household habit of the men, is a girdle of leather, with a bag before, and likewise a leathern apron to cover them behind; these girdles are sewed with hair of different colours. The Kamchatkans used formerly to go a-hunting and fishing during the summer in this dress; but now this fashion is changed, and they wear linen shirts, which they buy from the Russians.

The covering of their feet and legs is made of skins of different sorts: in the summer-time, during the rains, they wear the skins of seal with the hair outwards; but their most common covering is the skin of the legs of the rein-deer, and sometimes of the legs of other beasts, the shaggiest they can find, to preserve them against the cold. But the buskins which both the Cossacs and Kamchatkans use in their finest dresses, are made in the following manner: the sole is of white seal skin, the upper part of white fine leather, the hind quarters of white dog skin; what comes round the legs is of dressed leather, or dyed seal-skin; the upper parts are embroidered. These buskins are so extraordinary, that if a bachelor is observed to wear them, he is immediately concluded to be upon a scheme of courtship.

They wear the same sort of caps as the people of Yakutski. In summer they have a sort of hats of birch bark tied about their head. The kuriles use in the summer-time caps made of plated grass. The women's head-dress is the perukes that we formerly mentioned; and these were so dear to them, that when they came to be Christians, they were with difficulty prevailed upon to quit this dress for one more decent: however, at present, round the Rufs settlements, all is entirely changed, the women wearing shirts, ruffles, waistcoats, caps, and ribbands; which change nobody now complains of, except the very old people.

The women do all their work in mittins; they formerly never washed their faces, but now they use both white and red paint: for white paint they make use of a rotten wood; and for red a sea-plant, which they boil in seal's fat, and, rubbing their cheeks with it, make them very red. They dress most in the winter time, especially when they either receive or pay visits.

The common cloaths for a Kamchatkan and his family will not cost him less than 100 rubbles; for the coarsest worsted stockings, which cost in Russia 20 kopecks, cannot be bought here for less than a ruble; and all other things are sold in the same proportion. The Kuriles are more able to buy good cloaths than the Kamchatkans; for they can purchase for one sea-beaver, as much as the Kamchatkans can for twenty foxes; and one beaver costs the Kuriles no more trouble than five foxes do the Kamchatkans; for he must be a good hunter who catches more than ten foxes in the winter; and a Kurile thinks himself unlucky if he doth not catch three beavers in the season; besides which, great numbers are thrown upon the shore by storms.

The Kamchatkans divide their fish into six parts; Their diet. the sides and tail are hung up to dry; the back and thinner part of the belly are prepared apart, and generally dried over the fire; the head is laid to sour in pits, and then they eat it like salt fish, and esteem it much, though the stink is such that a stranger cannot bear it; the ribs and the flesh which remain upon them they hang up and dry, and afterwards pound for use; the larger bones they likewise dry for food for their dogs: in this manner all these different people prepare the yokola, which is their principal food, or, one may say, household bread; and they eat it for the most part dry.

Their second favourite food is caviar, or the roes of fish, which they prepare three different ways. They dry the roe whole in the air; or take it out of the skin which envelops it, and, spreading it upon a bed of grass, dry it before the fire; or, lastly, make rolls of it with the leaves of grass, which they also dry. They never take a journey or go to hunting without dry caviar; and, if a Kamchatkan has a pound of this, he can subsist without any other provision a great while: for every birch and alder tree furnishes him with bark, which, with his dried caviar, makes him an agreeable meal; but they cannot eat either separately, for the caviar sticks like glue to the teeth; and it is almost impossible to swallow the bark, chewed ever so long by itself. There is still a fourth method, which both Kamchatkans and Koreki use in preparing their caviar: the first having covered the bottom of a pit with grass, they throw the fresh caviar into it, and leave it there to grow sour: the Koreki tie theirs in bags, and leave it to sour; this is esteemed their most delicate dish.

There is a third sort of diet, called by the Kamchatkans *chupriki*, which is prepared in this manner: in their huts, over the fire-place, they make a bridge of stakes, upon which they lay a heap of fish, which remains there until the hut becomes as warm as a bag-nio. If there is no great thickness of fish, one fire serves to dress it; but sometimes they are obliged to make two, three, or more fires. Fish dressed in this

manner is half roasted, half smoked, but has a very agreeable taste, and may be reckoned the best of all the Kamchatka cookery: for the whole juice and fat is prepared with a gradual heat, and kept in by the skin, from which they may, when done enough, be easily separated; and as soon as it is thus dressed, they take out the guts, and spread the body upon a mat to dry: this they afterwards break small, and, putting it into bags, carry it along with them for provision, eating it like the yokola.

The Kamchatkans have a dish which they esteem very much, called *huigul*: it is fish laid to grow four in pits; and, though the smell of it is intolerable, yet the Kamchatkans esteem it a perfume. This fish sometimes rots so much in the pits, that they cannot take it out without lades; in which case indeed they use it for feeding their dogs.

As for the flesh of land and the larger sea animals, they boil it in their troughs, with several different herbs and roots; the broth they drink out of lades and bowls, and the meat they take out upon boards, and eat in their hands. The whale and sea-horse fat they also boil with roots.

There is a principal dish at all their feasts and entertainments, called *felaga*, which they make by pounding all sorts of different roots and berries, with the addition of caviar, and whale and seal's fat.

Before the conquest, they seldom used any thing for drink but plain water, unless when they made merry; then they drank water which had stood some time upon mushrooms. At present they drink spirits as fast as the Russians. After dinner they drink water: and when they go to bed at night, set a vessel of water by them, with the addition of snow or ice to keep it cold, and always drink it up before morning. In the winter-time, they amuse themselves frequently by throwing handfuls of snow into their mouths: and the bridegrooms, who work with the fathers of their future brides, find it their hardest task to provide snow for the family in summer-time; for they must bring it from the highest hills, be the weather what it will, otherwise they would never be forgiven.

The Kamchatkans commonly travel in sledges drawn by dogs. The animals used for this purpose differ very little from the common house-dogs; they are of a middling size, of various colours, though there seem to be more white, black, and grey, than of any other. In travelling, they make use of those that are castrated, and generally yoke four to a sledge. They drive and direct their dogs with a crooked stick about four feet long, which they sometimes adorn with different coloured thongs; this is looked upon as a great piece of finery. They drive their sledge sitting upon their right side, with their feet hanging down; for it would be looked upon as a disgrace for a man to sit down at the bottom of the sledge, or to make use of any person to drive him, nobody doing this but the women. It is very difficult to travel in these sledges; for unless a man keeps the exactest balance, he is liable every moment, from the height and narrowness of them, to be overturned: in a rugged road this would be very dangerous, as the dogs never stop till they come to some house, or are entangled by something upon the road; especially in going down steep hills, when they run with all their force, and are

scarcely to be kept in; for which reason, in descending any great declivity, they unyoke all the dogs except one, and lead them softly down. They likewise walk up hills; for it is as much as the dogs can do to drag up the sledge empty. After a deep snow, before it has been hardened by a frost, there is no travelling with dogs till a road be made, which is effected by a man going before upon snow-shoes, whom they call *brodovshika*. The snow-shoes are made of two thin boards, separated in the middle, bound together at the ends, and with the fore part bent a little upwards. The *brodovshika*, having one of these shoes upon each foot, leaves the dogs and sledge, and going on clears the road for some way; then returning, leads forward the dogs and sledge so far as the road is made; a method which he must continue till he comes to some dwelling-house. This is very laborious; and it happens so often, that no driver ever lets out without his snow-shoes. When a storm of driven snow surprises them, they are obliged with all haste to seek the shelter of some wood, and stay there as long as the tempest lasts, which sometimes is a whole week. If they are a large company, they dig a place for themselves under the snow, and cover the entry with wood or brambles. Sometimes they hide themselves in caves or holes of the earth, wrapping themselves up in their furs; and when thus covered, they move or turn themselves with the greatest caution, lest they should throw off the snow; for under that they lie as warm as in their common huts: they only require a breathing-place; but their cloaths must not be tight or hard girt about them, for then the cold is insufferable. Another danger attending travellers is, that in the severest frost several rivers are not quite frozen over; and as the roads for the most part lie close upon the rivers, the banks being very steep, scarce a year passes without many being drowned. A disagreeable circumstance also to those who travel in these parts, is their sometimes being obliged to pass through copes, where they run the risk of having their eyes scratched out, or their limbs broken; for the dogs always run most violently in the worst roads, and, to free themselves, very often overturn their driver. The best travelling is in the month of March or April, when the snow is turned hard, or frozen a little at top; however, there is still this inconvenience attending it, that sometimes travellers are obliged to lodge two or three nights in desert places; and it is difficult to prevail upon the Kamchatkans to make a fire, either for warming themselves or dressing victuals, as they and their dogs eat dried fish, and find themselves so warm wrapped in their furs, that they want no other heat; nay, all the people of this climate bear cold so well, that they sleep in the open air as found as others in a warm bed, and awake next morning perfectly refreshed and alert. This seems to be so natural to all here, that some of them have been seen to lie down with their backs uncovered against a fire, and notwithstanding the fire has been burnt out long before morning, they continued to sleep on very comfortably, and without any inconvenience.

*Islands in the Sea of Kamchatka.* So many of these have been discovered by the Russians, that the existence of almost a continued chain of islands between the continents of Asia and America is now rendered

Kamchatka extremely probable. Many further discoveries of great importance to science, however, remain yet to be made, and may in part be expected on the return of the British navigators who lately failed to these distant regions. The islands already known are the Kuril isles, which stretch southwest towards the coasts of China or Japan, and are almost uninhabited; those called *Beer- ing's*, and *Copper-islands*, the Aleutian isles, and Fox-islands, or *Lyssie Ostrova*, lie almost directly east, stretching nearly to 230° of Longitude east from Ferro. The first project of making discoveries in that tempestuous sea which lies between Kamchatka and America, was set on foot by Peter the Great of Russia. Captains Beering and Tschirikoff were employed in the undertaking; the former of whom was shipwrecked and died on the island which is still called by his name. As this lies at no great distance from Kamchatka, the inhabitants of the latter soon ventured over to it, as the sea-otters and other animals of that kind were accustomed to resort thither in great numbers.

16  
Copper-  
island de-  
scribed.

Mednoi Oltroff, or Copper-island, which lies in full sight of Beering's island, was next visited. This island has its name from the great quantity of copper with which the north-east coast of it abounds, the only side which is known to the Russians. It is washed up by sea, and covers the shores in such abundance that many ships might be loaded with it. Perhaps an India trader might make a profitable voyage from thence to China, where this metal is in high demand. This copper is mostly in a metallic or malleable state, and many pieces seem as if they had formerly been in fusion. The island is not high; but has many hillocks, each of which has the appearance of having formerly been a volcano. With this kind of hillocks all the islands in the sea of Kamchatka abound, inasmuch that not a single island, though ever so small, was found without one; and many of them consisted of nothing else. In short, all the chain of islands above-mentioned may, without any stretch of imagination, be considered as thrown up by some late volcanoes. The apparent novelty of every thing seems to justify this conjecture: nor can any objection be derived from the vegetable productions with which these islands abound; for the summer after the lower district of Zutphen in Holland was gained from the sea, it was covered over with wild mustard.—All these islands are subject to frequent and violent earthquakes, and abound in sulphur. We are not informed whether any lava is found upon them; but a party-coloured stone as heavy as iron, probably a lava, is mentioned as being found there. From this account it is by no means improbable that the copper above-mentioned has been melted in some eruption.

17  
Beering's  
island and  
the Aleu-  
tian isles.

Beering's island is situated due east from Kamchatka, in the 185th degree of longitude, and Copper-island about one degree more to the eastward, and in the latitude of 54° north. The former is from 70 to 80 versts long, and stretches from north-west to south-east in the same direction as Copper-island. The latter is about 50 versts in length. About 300 versts east-by-south of Copper-island, lie the Aleutian isles; of which Attak is the nearest: it is rather larger than Beering's island, and stretches from west to south-east. From thence, about 20 versts eastwards, is situated Semitski, extending from west to east; and near its extremity is another small island. To the south of the strait which

separates the two latter islands, and at the distance of Kamchatka 40 versts from both of them, lies Shimiya in a similar position, and not above 25 versts in length. All these islands lie between 54 and 55 degrees of north latitude.

18  
Fox-islands

The Fox-islands are situated east-north-east from the Aleutians: the nearest of these, Atchak, is about 800 versts distant; it lies in 56° north latitude, and extends from west-south-west, towards east-north-east. It greatly resembles Copper-island, and is provided with a commodious harbour on the north. From thence all the other islands of this chain stretch in a direction towards north-east by east. The next to Atchak is Amlak, and about 15 versts distant; it is nearly of the same size, and has an harbour on its south side. Next follows Saugagamak at about the same distance, but somewhat smaller; from thence is 50 versts to Amuchta, a small rocky island; and the latter to Yunakfan, another small island. About 20 versts from Yunakfan there is a cluster of five small islands, or rather mountains, Kigalgik, Kagamila, Tigulak, Ulaga, and Tana-Unok; and which are therefore called by the Russians *Pat Sopki*, or the Five Mountains. Of these Tana-Unok lies most to the north-east, towards which the western point of Umnak advances within the distance of 20 versts.

Umnak stretches from south-west to north-east; it is 150 versts in length, and has a very considerable bay on the west end of the northern coast, in which there is a small island or rock, called *Adugak*; and on the southside Shemalga, another rock. The western point of Aghun Alashka, or Unalashka, is separated from the east end of Umnak by a strait near 20 versts in breadth. The position of these two islands is similar; but Aghun-alashka is much the largest, and is above 200 versts long. It is divided towards the north-east into three promontories, one of which runs out in a westerly direction, forming one side of a large bay on the north-coast of the island: the second stretches out north-east, ends in three points, and is connected with the island by a small neck of land. The third or most southerly one is separated from the last-mentioned promontory by a deep bay. Near Unalashka towards the east lies another small island called *Shirkin*. About 20 versts from the north-east promontory of Aghun-alashka lie four islands: the first, Akutan, is about half as big as Umnak; a versth further is the small island Akun; a little beyond is Akunok; and lastly Kigalga, which is the smallest of these four, and stretches with Akun and Akunok almost from north to south. Kigalga is situated about the 61st degree of latitude. About 100 versts from thence lies an island called *Unimak*, upon which a Russian navigator (Captain Krenitzin) wintered; and beyond it the inhabitants said there was a large tract of country called *Alashka*, of which they did not know the boundaries.

The Fox-islands are in general very rocky, without containing any remarkably high mountains: they are destitute of wood; but abound in rivulets and lakes, which are mostly without fish. The winter is much milder than in Siberia; the snow seldom falls before the beginning of January, and continues on the ground till the end of March. There is a volcano in Amuchta, and sulphur is produced on another island, in some others are springs hot enough to boil provisions. Sulphu-

Kamcharka phureous flames also are sometimes seen at night upon the mountains of Unalashka and Akutan.

<sup>19</sup> Manners, &c. of the inhabitants. The Fox-islands are tolerably populous in proportion to their size. The inhabitants are entirely free, and pay tribute to no one; they are of a middle stature, and live, both in summer and winter, in holes dug in the earth. No signs of religion were found among them. Several persons indeed pass for forerers, pretending to know things past and to come; and are accordingly held in high esteem, but without receiving any emolument. Filial duty and respect towards the aged are not held in estimation by these islanders. They are not, however, deficient in fidelity towards each other; they are of a lively and cheerful temper, though rather impetuous, and naturally prone to anger. In general, they do not observe any rules of decency; but follow all the calls of nature publicly, and without the least reserve. Their principal food consists in fish and other sea-animals, small shell-fish, and sea-plants; their greatest delicacies are wild lilies and other roots, together with different kinds of berries. When they have laid in a store of provisions, they eat at any time of the day without distinction; but in case of necessity, they are capable of fasting several days together. They seldom heat their dwellings; but when they are desirous of warming themselves, they light a bundle of hay, and stand over it; or else they let fire to train-oil, which they pour into a hollow stone. They feed their children when very young with the coarsest flesh, and for the most part raw. If an infant cries, the mother immediately carries it to the sea-side, and, be it summer or winter, holds it naked in the water, until it is quiet. This custom, it is said, is so far from doing the children any harm, that it hardens them against the cold; and accordingly, they go barefooted through the winter without the least inconvenience. They are also trained to bathe frequently in the sea; and it is an opinion generally received among the islanders, that by these means they are rendered bold and fortunate in fishing.

The men wear shirts made of the skins of cormorants, sea-divers, and gulls; and, in order to keep out the rain, they have upper garments of the bladders and other intestines of sea-lions, sea-calves, and whales, blown up and dried. They cut their hair in a circular form quite close to their ears; and shave also a round place on the top. The women, on the contrary, let the hair descend over the forehead as low as the eyebrows, and tie the remaining part in a knot upon the top of the head. They pierce the ears, and hang in them bits of coral, which they get from the Russians. Both sexes make holes in the gristles of their noses, and in the under-lips, in which they thrust pieces of bone, and are very fond of such kind of ornaments. They mark also and colour their faces with different figures. They barter among one another sea-otters, sea-bears, clothes made of birds-skins and of dried intestines, skins of sea-lions and sea-calves for the coverings of their canoes, wooden masks, darts, thread made of sinews and hair of reindeer.

Their household utensils are square pitchers and large troughs, which they make out of the wood driven ashore by the sea. Their weapons are bows and arrows pointed with flint, and javelins of two yards in

length, which they throw from a small board. In Kamcharka instead of hatchets, they use crooked knives of flint or bone. Some iron knives, hatchets, and lances, were observed among them, which they had probably got by plundering the Russians.

According to the reports of the oldest inhabitants of Umnak and Unalaska, they have never been engaged in any war, either amongst themselves or with their neighbours, except with the people of Alashka, the occasion of which was as follows. The son of the toigon or chief of Umnak had a maimed hand; and some inhabitants of Alashka, who came to visit upon that island, fastened to his arm a drum, out of mockery, and invited him to dance. The parents and relations of the boy were offended at this insult; hence a quarrel ensued; and from that time the people have lived in continual enmity, attacking and plundering each other by turns. According to the reports of the islanders, there are mountains upon Alashka, and woods of great extent at some distance from the coast. The natives wear cloaths made of the skins of reindeer, wolves, and foxes; and are not tributary to any of their neighbours. The inhabitants of the Fox-Islands seem to have no knowledge of any country beyond Alashka, which is one of the most easterly islands yet discovered in these seas, and is probably not far distant from the continent of America.

Festals are very common among these islanders; and more particularly when the inhabitants of one island are visited by those of the others. The men of the village meet their guests, beating drums, and preceded by the women who sing and dance. At the conclusion of the dance, the hosts invite them to partake of the feasts; after which ceremony, the former return first to their dwellings, place mats in order, and serve up their best provision. The guests next enter, take their places, and, after they are satisfied, the diversions begin. First, the children dance and caper, at the same time making a noise with their small drums, while the owners of the huts of both sexes sing. Next, the men dance almost naked, tripping after one another, and beating drums of a larger size: when these are weary, they are relieved by the women, who dance in their cloaths, the men continuing in the mean time to sing and beat their drums. At last the fire is put out which had been kindled for the ceremony. The manner of obtaining fire is by rubbing two pieces of dry wood against each other, or most commonly by striking two flints together, and letting the sparks fall upon some sea-otter's hair mixed with sulphur. If any forcerer is present, it is then his turn to play his tricks in the dark; if not, the guests immediately retire to their huts, which are made, on that occasion, of their canoes and mats. The natives who have several wives do not withhold them from their guests; but where the owner of the hut has himself but one wife, he then makes the offer of a female servant.

Their hunting-season is principally from the end of October to the beginning of December; during which time they kill great numbers of young sea-bears for their clothing. They pass all December in feasting and diversions similar to those abovementioned: with this difference, however, that the men dance in wooden masks, representing various sea-animals, and painted red, green, or black, with coarse-coloured earthen found

Kamchatka upon these islands.

||  
Karle.

During these festivals, they visit each other from village to village, and from island to island. The feasts concluded, masks and drums are broken to pieces, or deposited in caverns among the rocks, and never afterwards made use of. In spring, they go out to kill old sea-bears, sea-lions, and whales. During summer, and even in winter when it is calm, they row out to sea, and catch cod and other fish. Their hooks are of bone ; and for lines they make use of a string made of a long tenacious sea-weed, which is sometimes found in those seas near 160 yards in length.

Whenever they are wounded in any encounter, or bruised by any accident, they apply a sort of yellow root to the wound, and fast for some time. When their head aches, they open a vein in that part with a stone-lancet. When they want to glue the points of their arrows to the shafts, they strike their nose till it bleeds, and use the blood as glue.

Murder is not punished among them ; for they have no judge. The following ceremonies are used in the burial of the dead. The bodies of poor people are wrapped up in their own cloaths, or in mats ; then laid in a grave, and covered over with earth. The bodies of the rich are put, together with their cloaths and arms, in a small boat made of the wood driven ashore by the sea : this boat is hung upon poles placed crosswise ; and the body is thus left to rot in the open air.

The customs and manners of the inhabitants of the Aleutian isles are nearly similar to those of the inhabitants of the Fox-islands. The former indeed are rendered tributary and entirely subject to Russia ; and most of them have a slight acquaintance with the Russian language, which they have learned from the crews of the different vessels who have landed there.

KANISCA, a very strong town of Lower Hungary, capital of the county of Selawar. It was taken by the imperialists in 1690. It is seated on the river Drave, in E. Long. 17. 37. N. Lat. 46. 23.

KAOLIN, the name of an earth which is used as one of the two ingredients in oriental porcelain. Some of this earth was brought from China, and examined by Mr Reaumur. He found that it was perfectly unfusible by fire, and believed that it was a talky earth ; but Mr Macquer observes, that it is more probably of an argillaceous nature, from its forming a tenacious paste with the other ingredient called *petunse*, which has no tenacity. Mr Bomare says, that by analysing some Chinese kaolin, he found it was a compound earth consisting of clay, to which it owed its tenacity ; of calcareous earth, which gave it a mealy appearance ; of sparkling crystals of mica ; and of small gravel, or particles of quartz crystals. He says, that he has found a similar earth upon a stratum of granite, and conjectures that it may be a decomposed granite. This conjecture is the more probable, as kaolins are frequently found in the neighbourhood of granites. See PORCELAIN.

KAOUTCHOUCK. See CAOUTCHOUC.

KARAT. See CARACT.

KARLE, a Saxon word used in our laws, sometimes simply for a man ; and sometimes, with an addition, for a servant or clown. Thus the Saxons call a

seaman *bufcarle*, and a domestic servant *bufcarle*. Karmatians From hence comes the modern word *churl*.

KARMATIANS, a sect of Mohammedans who occasioned great disorders in the empire of the Arabs. See BAGDAD, n° 49.

KASTRIL, or KESTRIL. See FALCO.

KAUFFBEUREN, a free and imperial town of Germany, situated in the river Wardach, in E. Long. 10. 53. N. Lat. 47. 57.

KAY, QUAY, or Key. See KEY.

KEBLA, an appellation given by the Mahometans to that part of the world where the temple of Mecca is situated, towards which they are obliged to turn themselves when they pray.

KECKERMANN (Bartholomew), a native of Dantzick, and professor of philosophy there about the beginning of the 17th century, composed systems of almost all the sciences, in which he shews more method than genius.

KEDAR, (anc. geog.), a district in the desert of the Saracens, (so called from *Kedar*, the son of Ishmael, according to Jerome, who in another place says that Kedar was uninhabitable), on the north of Arabia Felix. *Kedareni*, the people ; who dwelt in tents like the other Scenites (Palm cxx.), were rich in cattle (Isaiah lx.), of a swarthy complexion (Cantic. i.), and excellent at the bow (Isaiah xxi.)

KEDES, (anc. geog.), a city of refuge and Levitical in the tribe of Naphtali, on the confines of Tyre and Galilee ; (Josephus). Jerome calls it a sacerdotal city, situated on a mountain 20 miles from Tyre, near Paneas, and called *Cidifus*, taken by the king of Assyria.—Another *Kedes* in the tribe of Issachar, (1 Chron. vii. 72.) which seems to be called *Kifon*, (Joshua xix.)

KEDGE, a small anchor, used to keep a ship steady whilst she rides in a harbour or river, particularly at the turn of the tide, when she might otherwise drive over her principal anchor, and entangle the stock or flukes with her slack-cable, so as to loosen it from the ground. This is accordingly prevented by a kedge-rope that hinders her from approaching it. The kedges are particularly useful in transporting a ship ; i. e. removing her from one part of the harbour to another, by means of ropes which are fastened to these anchors. They are generally furnished with an iron stock, which is easily displaced for the convenience of stowing them.

KEDRON, or CEDRON, (anc. geog.) a town, which, from the defeat and pursuit of the Syrians (1 Macc. xvi.) appears to have stood on the road which led from the Higher India to Azotus : in this war it was burnt by the Jews.

KEDRON, or Cedron, (anc. geog.) St John calls it a brook, but Josephus a deep valley, between the Syrians and mount Olivet to the east ; called also *Kedron*, from its blackness. A brook only in winter, or in rainy weather, according to Maundrel.

KEEL, the principal piece of timber in a ship, which is usually first laid on the blocks in building. If we compare the carcass of a ship to the skeleton of the human body, the keel may be considered as the back-bone, and the timbers as the ribs. It therefore supports and unites the whole fabric, since the stem and

Keel,  
Keelson.

and stern-post, which are elevated on its ends, are, in some measure, a continuation of the keel, and serve to connect and inclose the extremities of the sides by transoms; as the keel forms and unites the bottom by timbers.

The keel is generally composed of several thick pieces placed lengthways, which, after being scarfed together, are bolted, and clenched upon the upper side. When these pieces cannot be procured large enough to afford a sufficient depth to the keel, there is a strong thick piece of timber bolted to the bottom thereof, called the *false keel*, which is also very useful in preserving the lower side of the main keel. In our largest ships of war, the false keel is generally composed of two pieces, which are called the *upper* and the *lower false keels*. See *MIDSHIP-Frame*.

The lowest plank in a ship's bottom, called the *garboard-streak*, has its inner-edge let into a groove or channel, cut longitudinally on the side of the keel: the depth of this channel is therefore regulated by the thickness of the garboard-streak.

KEEL is also a name given to a low flat-bottomed vessel, used in the river Tyne to bring the coals down from Newcastle and the adjacent parts, in order to load the colliers for transportation.

KEEL-Hauling, a punishment inflicted for various offences in the Dutch navy. It is performed by plunging the delinquent repeatedly under the ship's bottom on one side, and hoisting him up on the other, after having passed under the keel. The blocks, or pulleys, by which he is suspended, are fastened to the opposite extremities of the main-yard, and a weight of lead or iron is hung upon his legs, to sink him to a competent depth. By this apparatus he is drawn close up to the yard-arm, and thence let fall suddenly into the sea, where, passing under the ship's bottom, he is hoisted up on the opposite side of the vessel. As this extraordinary sentence is executed with a serenity of temper peculiar to the Dutch, the culprit is allowed sufficient intervals to recover the sense of pain, of which indeed he is frequently deprived during the operation. In truth, a temporary insensibility to his sufferings ought by no means to be construed into a disrespect of his judges, when we consider that this punishment is supposed to have peculiar propriety in the depth of winter, whilst the flakes of ice are floating on the stream; and that it is continued till the culprit is almost suffocated for want of air, benumbed with the cold of the water, or stunned with the blows his head receives by striking the ship's bottom.

KEELSON, a piece of timber which may be properly defined the interior or counter-part of the keel, as it is laid upon the middle of the floor-timbers, immediately over the keel, and, like it, composed of several pieces scarfed together. In order to fit with more security upon the floor-timbers and crotches, it is notched about an inch and a half deep, opposite to each of those pieces, and thereby firmly scored down upon them to that depth, where it is secured by spike-nails. The pieces of which it is formed are only half the breadth and thickness of those of the keel.

The keelson serves to bind and unite the floor-timbers to the keel. It is confined to the keel by long bolts,

which, being driven from without through several of the timbers, are fore-locked or clenched upon rings on the upper-side of the keelson.

KEEPER of the *Great Seal*, is a lord by his office, and styled *lord keeper of the great seal of Great Britain*; he is always one of the privy-council. All grants, charters and commissions of the king under the great seal, pass through the hands of the lord-keeper: for, without that seal, many of those grants, &c. would be of no force; the king being, in the interpretation of the law, a corporation, and therefore passes nothing but by the great seal, which is also said to be the public faith of the kingdom, being in the highest esteem and reputation.

Whenever there is a lord-keeper, he is invested with the same place, authority, pre-eminence, jurisdiction, or execution of laws, as the lord-chancellor of Great-Britain is vested with.

The lord-keeper is constituted by the delivery of the great seal, &c.

KEEPER of the *Privy-seal*, is also a lord by his office, through whose hands all grants, pardons, &c. pass before they come to the great seal; and even some things pass his hands which do not pass the great seal at all. This officer is also one of the privy-council, yet was anciently called *clerk of the privy-seal*. His duty is to put the seal to no grant, &c. without a proper warrant; nor with warrant where it is against law, or inconvenient, but shall first acquaint the king therewith.

KEIL, a very important fortress of Germany, seated on the banks of the Rhine, built by the French after a design of marshal Vauban, for the defence of Strasburg. It was ceded to the empire in 1697, by the treaty of Ryfwick. The French retook it in 1703, and it was restored to the empire by the treaty of Rastadt. E. Long. 7.45. N. Lat. 48.40.

KEILL (Dr John), a celebrated astronomer and mathematician, was born at Edinburgh in 1671, and studied in the university of that city. In 1694 he went to Oxford; where, being admitted of Balliol-college, he began to read lectures according to the Newtonian system in his private chamber in that college. He is said to have been the first who taught Sir Isaac Newton's principles by the experiments on which they are founded: and thus, it seems, he did by an apparatus of instruments of his own providing, by which means he acquired a great reputation in the university. The first specimen he gave the public of his skill in mathematical and philosophical knowledge, was his *Examination of Dr Burnet's theory of the earth*, with *Remarks on Mr Whiston's theory*: and these theories being defended by their respective inventors, drew from Mr Keill *An examination of the reflections on the theory of the earth*, together with *A defence of the remarks on Mr Whiston's new theory*. In 1701, he published his celebrated treatise, intitled, *Introductio ad veram physicam*, which only contains 14 lectures; but in the following editions he added two more. This work has been translated into English, under the title of *An introduction to natural philosophy*. Afterwards, being made fellow of the Royal Society, he published, in the *Philosophical Transactions*, a paper of the laws of attraction; and being offended at a passage in the *Acta eruditum* of Leipzig, warmly vindicated, against

Keith.

Mr Leibnitz, Sir Isaac Newton's right to the honour of the first invention of his method of fluxions. In 1709 he went to New-England, as treasurer of the Palatines. About the year 1711, several objections being urged against Sir Isaac Newton's philosophy, in support of Des Cartes's notions of a plenum, Mr Keill published a paper in the Philosophical Transactions on the rarity of matter, and the tenuity of its composition. But, while he was engaged in this dispute, queen Anne was pleased to appoint him her deceiver; and he continued in that place under king George I. till the year 1716. He had also the degree of doctor of physic conferred on him by the university of Oxford, in 1713. He died in 1721. He published, besides the works already mentioned, *Introductio ad veram astronomiam*, which was translated into English by Dr Keill himself; and an edition of Commandinus's Euclid, with additions of his own.

KEILL (James), M. D. an eminent physician, and brother of the former, was born in Scotland, about the year 1673; and having travelled abroad, read lectures of anatomy with great applause in the universities of Oxford and Cambridge, by the latter of which he had the degree of doctor of physic conferred upon him. In 1700 he settled at Northampton, where he had considerable practice as a physician; and died there of a cancer in the mouth, in 1719. He published, 1. An English translation of Lemery's chemistry. 2. An account of animal secretion, the quantity of blood in the human body, and muscular motion. 3. A treatise on anatomy. 4. Several pieces in the Philosophical Transactions.

KEISERSBERG, a town of Alsace in France, and in the bailiwick of Haguenau, which has belonged to the French ever since the year 1548. It is seated in a pleasant country, in E. Long. 7. 25. N. Lat. 48. 10.

KEISERSLAUERN, a town of Germany, in the Lower Palatinate, belonging to the elector Palatine; seated on the river Louter, in E. Long. 7. 51. N. Lat. 49. 22.

KEISERTOUL, a town of Switzerland, in the county of Baden, with a bridge over the Rhine, and a castle. It belongs to the bishop of Constance, and is situated in E. Long. 8. 40. N. Lat. 47. 10.

KEISERWERT, a town of Germany in the circle of Westphalia, the diocese of Cologne, and the duchy of Berg; subject to the elector Palatine. The fortifications are demolished. It is seated on the Rhine, in E. Long. 6. 49. N. Lat. 51. 16.

KEITH (James), field-marshal in the Prussian service, was the younger son of William Keith, earl-marshal of Scotland; and was born in 1696. He was designed by his friends for the law; but his inclination led to arms, and the first occasion of drawing his sword was rather an unhappy one. When he was 18 years old, the rebellion broke out in Scotland; and, through the instigation of his mother, he joined James's party: he was wounded at the battle of Sheriff-muir, and made his escape to France. Here he applied himself to military studies; and going to Madrid, he by the interest of the duke of Liria obtained a commission in the Irish brigades, then commanded by the duke of Ormond. He afterwards at-

tended the duke of Liria when he went ambassador to Muscovy; and, being by him recommended to the czarina, was promoted to the rank of lieutenant-general, and invested with the order of the black eagle. He distinguished himself by his valour and conduct in the Russian service, and had no inconsiderable share in the revolution that raised Elizabeth the daughter of Peter the Great to the throne: he also served in several embassies; but finding the honours of that country but a splendid kind of slavery, he left that court, and entered the Prussian service. The king of Prussia made him field-marshal of the Prussian armies, and governor of Berlin; and distinguished him so far by his confidence, as to travel in disguise with him over a great part of Germany, Poland, and Hungary. In business, he made him his chief counsellor; in his diversions, his chief companion. The king was much pleased with an amusement which the marshal invented in imitation of the game of chess. The marshal ordered several thousand small statues of men in armour to be cast by a founder; these he would set opposite to each other, and range them in battalia, in the same manner as if he had been drawing up an army; he would bring out a party from the wings or centre, and shew the advantage or disadvantage resulting from the different draughts which he made. In this manner the king and the marshal often amused themselves, and at the same time improved their military knowledge. This brave and experienced general, after many important services in the late wars of that illustrious monarch, was killed in the unfortunate affair of Hohenkirchen, in the year 1758.

KELLINGTON, or KILKHAMPTON, a town of Cornwall in England, which sends two members to parliament. W. Long. 4. 38. N. Lat. 50. 36.

KELP, in the glass-trade, a term used for a sort of potashes made use of in many of the glass-works, particularly for the green glass. It is the calcined ashes of a plant called by the same name; and in some places, of sea-thongs or laces, a sort of thick-leaved fucus or sea-wrack\*. This plant is thrown on the rocks and shores in great abundance, and in the summer months is raked together and dried as hay in the sun and wind, and afterwards burnt to the ashes called *kelp*.

KELSO, a town of Roxburghshire in Scotland, pleasantly situated on the river Tweed, in W. Long. 1. 20. N. Lat. 55. 38. Of this town Mr Pennant gives the following description. "It is built much after the manner of a Flemish town, with a square and town-house. It contains about 2700 souls, has a very considerable market, and great quantities of corn are fold here weekly by sample. The parish-church is darksome and inconvenient, being part of that belonging to the abbey; but a new one is building, in an octagonal form, 82 feet in diameter, supported by a circle of pillars.

"The abbey of Tyronensians was a vast pile, and, to judge by the remains, of venerable magnificence. The walls are ornamented with false round arches, intersecting each other. Such interfections form a true Gothic arch; and may as probably have given rise to that mode, as the arched shades of avenues. The steeple of the church is a vast tower. This house was founded by David I. when earl of Cumberland. He

PENDIX.

Kelfo,  
Kempis.Kempton  
Kendal.

first placed it at Selkirk, then removed it to Roxburgh, and finally, when he came to the crown, fixed it here in 1128. Its revenues were, in money, above 2000 l. Scots a-year. The abbot was allowed to wear a mitre and pontifical robes; to be exempt from episcopal jurisdiction, and permitted to be present at all general councils.

"The environs of Kelfo are very fine: the lands consist of gentle risings, inclosed with hedges, and extremely fertile. They have much reason to boast of their prospects. From the Chalkheugh is a fine view of the forks of the rivers, Roxburgh-hill, Sir John Douglas's neat seat, and, at a distance, Fleurus; and from Pinnacle-hill is seen a vast extent of country, highly cultivated, watered with long reaches of the Tweed, well wooded on each margin. These borders ventured on cultivation much earlier than those on the west or east, and have made great progress in every species of rural economy. Turnips and cabbages, for the use of cattle, cover many large tracts; and potatoes appear in vast fields. - Much wheat is raised in the neighbourhood, part of which is sent up the frith of Forth, and part into England.

"The fleeces here are very fine, and sell from 12 to 14 shillings the stone of 24 lb. and the picked kind from 18 to 20. The wool is sent into Yorkshire, to Linlithgow, or into Aberdeenshire, for the stocking manufacture; and some is woven here into a cloth, called *plains*, and sold into England to be dressed. Here is also a considerable manufacture of white leather, chiefly to supply the capital of Scotland.

"From what I can collect, the country is greatly depopulated. In the reign of James VI. or a little before the Union, it is said that this county could send out 15,000 fighting men: at present it could not raise 3000. But plundering in those times was the trade of the borderers, which might occasion the multitude of inhabitants."

Over the Tweed at Kelfo is a fine stone bridge of six arches: but the river does not in this place divide the kingdoms of Scotland and England from each other; for the Scots possess the country for several miles to the southward.

KEMPIS (Thomas à), a pious and learned regular canon, was born at the village of Kemp, in the diocese of Cologne, in 1380; and took his name from that village. He performed his studies at Deventer, in the community of poor scholars established by Gerard Groot; and there made a great progress in the sciences. In 1399, he entered the monastery of the regular canons of Mount St Agnes, near Zwol, of which his brother was prior. Thomas à Kempis there distinguished himself by his eminent piety, his respect for his superiors, his charity to his brother canons, and his continual application to labour and prayer. He died in 1471, aged 70. The best editions of his works, which consist of sermons, spiritual treatises, and lives of holy men, are those of Paris, in 1549, and of Antwerp, in 1607. The famous and well-known book *De Imitatione Christi*, which has been translated into almost all the languages of the world, though it has almost always been numbered among the works of Thomas à Kempis, is also found printed under the name of *Gerfon*; and on the credit of some MSS. has been since as-

Vol. VI.

cribed to the abbot Gerfon of the order of -St Benedict. This has occasioned a violent dispute between the canons of St Augustine and the Benedictines: but while devout Christians find spiritual comfort in the work, the name of the writer is of small importance.

KEMPTEN, a free and imperial town of Germany, in Lower Suabia, and in Algow, and also in the territory of the abbot of Kempton, who is a prince of the empire, and has a voice in the diet. The inhabitants are Protestants; and it has been several times taken, but has always recovered its liberty. It is seated on the river Iller. E. Long. 10. 33. N. Lat. 47. 47.

KEMPTEN, a territory in the circle of Suabia, in Germany, between the bishopric of Augsberg, and the barony of Walburg. It is about 17 miles long and broad; and has no considerable place but the towns of Kempton and Kauffbeuren, which are imperial.

KEN (Thomas), an eminent English bishop in the 17th century, was bred at Winchester school, whence he went to Oxford; and in 1669, was made a prebend of Winchester. In 1675, the year of the jubilee, he travelled to Rome; and used to say, He had reason to give God thanks for his travels, having returned more confirmed of the purity of the reformed religion than he was before. He was appointed by king Charles II. to attend the lord Dartmouth at the demolishing of Tangier; and at his return was made chaplain to his majesty, as he was some time after to the prince of Orange, then residing in Holland. In 1685, he was consecrated bishop of Bath and Wells. The month following he attended king Charles II. at his death; and gave close attendance at the royal bed for three whole days and nights, watching proper intervals to suggest pious and proper thoughts on so serious an occasion. In the following reign he zealously opposed the progress of Popery; and in June 1688, he, with five other bishops and the archbishop of Canterbury, was committed prisoner to the Tower of London for subscribing a petition to his majesty against the declaration of indulgence. Upon the Revolution, however, he refused to take the oaths to king William and Queen Mary, on which account he was deprived of his bishopric. Her majesty queen Anne bestowed on him a yearly pension of 200 l. to his death in 1710. He published several pious books. His charity was so great, that when he was bishop of Bath and Wells, having received a fine of 4000 l. he gave a great part of it to the French Protestants.

KENDAL, a town of Westmoreland, seated in a valley, among hills, on the west side of the river Can or Ken, over which there are two stone bridges, and one of wood, which leads to the castle, now in ruins. It is a large handsome place; and has two long streets, which cross each other. The church is a spacious structure, supported by five rows of pillars, and 12 chapels of ease belonging to it. The free-school stands on the side of the church-yard; and is well endowed, having exhibitions to Queen's-college in Oxford. It is noted for its manufactures of cotton, druggets, hats, and stockings.—The castle is remarkable for being the birth-place of Catharine Par, the last wife of Henry VIII. The different branches of the woollen manufacture were established here by certain Flemings as far back as the reign of Edward III. who encouraged them to settle both at Kendal and Colchester. W. Long. 2. 40.

22 X

N.

Kenks. N. Lat. 54. 15.

Kennel.

KENKS, in the sea-language, doublings in a rope or cable, when handed in and out, so that it does not run easy; or when any rope makes turns or twists, and does not run free in the block, then it is said to make kenks.

KENNEL, a place or little house for hounds; and, in a metaphorical sense, used for the pack of hounds itself. To make a complete kennel, three conveniences ought to be observed, *viz.* a sweet air, fresh water, and the morning-sun; for which the following rules may be instructive.—The court should be large; for the more spacious it is, the better it will be for the hounds to refresh themselves in: and it should be well walled, or fenced about, to prevent their getting out, but not so high as to keep out the sun or wind. The water, if possible, should run through some part of the court or yard; or, for want thereof, have a well with a stone trough about a foot and a half high, always kept with fresh water, to the end the hounds may drink when they please; and at one end of the trough there must be a hole to let out the water for cleansing it. Let the kennel be built in the highest part of the court, in which there should be two rooms, one of which should be larger than the other, with a large chimney to make a fire when need requires. This room should be raised about three feet from the ground, and in the floor there should be two gutters for the conveyance of the urine. There must be dispersed up and down small bedsteads raised a foot from the floor, with holes pierced through the planks for drawing away their urine. The other room must be for the huntsman to keep his poles, whips, salves, and the like necessities; there should also be a copper for the boiling, dressing, and ordering of their food, when they come home wet and weary. Be careful not to give them any drink in vessels of copper; and as to the proportion and quality of allowance for food, it must be ordered with relation to the nature of the hounds and their sizes: three bushels of oats, with a bushel and a half of wheat-bran, will serve ten couple and a half of middling-sized hounds a week, giving them sometimes beef broth, whey, silted-milk, chippings of bread, bones, and sometimes a little horse-flesh; for change of food creates a good appetite, and preserves health. The oats and wheat-bran must be boiled and thickened with milk and butter-milk, with some chippings, or some broken meat boiled therein. With regard to horse-flesh, those best skilled this way, think, of all their foods (provided it be given with discretion), horse-flesh the best, and hottest. As for dogs that are accustomed to hunt the hare, it is not good to give them any meat, because it is said to withdraw their scent or affections from the chase, as their flesh is not very sweet, nor their scent very strong. If the huntsman perceives, that through long and frequent chasing the hounds fall away, he must be more careful in feeding and cherishing them with some good broth of boiled oxen or sheep hearts. On such days as the hounds do not hunt, the best times to feed them are early, before sun-rising, and late in the evening, after sun-set; and on the days they hunt, they ought to be rewarded as they come home, be it when it will, with a good supper; for nothing is a greater discouragement to a hound than to

go to sleep with an empty belly after hard labour. If you have more dead flesh than you have present occasion for, it may be preserved a week or ten days sweet, by burying it under ground.

To KENNEL, a term applied by fox-hunters to a fox when he lies in his hole.

KENNET (Dr White), a learned English writer and bishop of Peterborough, in the 18th century, bred at St Edmund-hall, Oxford; where he soon distinguished himself by his vigorous application to his studies, and by his translations of several books into English, and other pieces which he published. In 1695, our author published his *Parochial Antiquities*. A sermon preached by him on the 30th of January 1703, at Aldgate, exposed him to great clamour. It was printed under the title of *A compassionate inquiry into the causes of the civil war*. In 1706, he published his *Case of Impropriations*, and two other tracts on the same subject. In 1706, he published the third volume of *The Complete History of England*, (the two former volumes compiled by Mr Hughes). In 1709, he published *A Vindication of the Church and Clergy of England from some late reproaches* rudely and unjustly cast upon them; and *A true Answer to Dr Sacheverell's Sermon*. When the great point in Dr Sacheverell's trial, the change of the ministry, was gained, and very strange addresses were made upon it, there was to be an artful address from the bishop and clergy of London, and they who would not subscribe it were to be represented as enemies to the queen and the ministry. Dr Kennet fell under this imputation. He was exposed to great odium as a low-church man, on account of his conduct and writings. When he was dean of Peterborough, a very uncommon method was taken to expose him by Dr Walton, rector of the church of White chapel: for in the altar-piece of that church, which was intended for a representation of Christ and his 12 apostles eating the passover and last supper, Judas the traitor was drawn sitting in an elbow-chair, dressed in a black garment, with a great deal of the air of Dr Kennet's face. It was generally said, that the original sketch was for a bishop under Dr Walton's displeasure; but the painter being apprehensive of an action of *Scandalum Magnatum*, leave was given to drop the bishop, and make the dean. This giving general offence, upon the complaint of others (for Dr Kennet never saw it, or seemed to regard it), the bishop of London ordered the picture to be taken down. In 1713, he presented the society for propagating the gospel with a great number of books, suitable to their design; published his *Bibliotheca Americana Primordia*, and founded an antiquarian and historical library at Peterborough. In 1715, he published a sermon, intitled, *The Witchcraft of the present Rebellion*, and afterward several other pieces. In 1717, he was engaged in a dispute with Dr William Nicholson, bishop of Carlisle, relating to some alterations in the bishop of Bangor's famous sermon; and disliked the proceedings of the convocation against that bishop. Upon the death of Dr Cumberland bishop of Peterborough, he was promoted to that see, to which he was consecrated in 1718. He sat in it more than ten years, and died in 1728. He was an excellent philologist, a good preacher, whether in English or Latin,

Kennet.

Kent.

Kent.

tin, and well versed in the histories and antiquities of our nation.

KENNET (Basil), a learned English writer, and brother to the preceding, was educated in Corpus Christi college in the university of Oxford, where he became fellow. In 1706, he went over chaplain to the English factory at Leghorn; where he met with great opposition from the Papists, and was in danger from the inquisition. He died in the year 1714. He published *Lives of the Greek Poets*; the *Roman Antiquities*; a volume of *Sermons* preached at Leghorn; A translation into English of Puffendorf's *Treatise of the Law of Nature and Nations*. He was a man of moral exemplary integrity, generosity, piety, and modesty.

KENT, one of the counties of England, situated at the fourth-east corner of the island, and from thence enjoying many advantages. The capacious æstuary of the Thames washes its northern parts, as the sea does the fourth-east; whence some, with no great impropriety, have styled it a *peninsula*. In point of extent, this is the fifth shire in South Britain, little less in its dimensions than the province of Holland; larger in size than the duchy of Juliers in Germany; and almost exactly equal to that of Modena in Italy. Kent is, with great appearance of truth, supposed to be so styled from the ancient British word *kant*, signifying a *corner*, or, when applied to a country, a *head-land*. It is certain, that the Romans bestowed the name of *Cantium* on the province, and on its most conspicuous promontory the north Foreland; and, from the district they inhabited, the people were called *Cantii*; which has prevailed even to our times, when *Kent*, and *the men of Kent*, are the common appellatives. It is however, probable, that these *Cantii* were not the original inhabitants, but a latter colony from the opposite continent, established here, like the Belgæ, not long before the Roman invasion. At the time of Cæsar's coming, this spacious and fertile region was divided into four principalities, or, as they are, according to the manners of those days, commonly called, *kingdoms*. It was his observation of these people, that they were particularly distinguished by their civility and politeness; a character which their descendants have preserved. When that wise people became masters of the southern parts of the island, this province received the most conspicuous marks of their attention, as appears from the stations which they so prudently established, while their government flourished in its full vigour. The care they took of the ports on the sea-coast as soon as it came to be in danger, and the several fortresses which they erected for the defence of their subjects against the sudden attempts of barbarous invaders, are evidences of the same kind. These sorts, so prudently disposed, and so well secured, were under the direction of a particular great officer, called *Littoris Saxonici Comes*, i. e. the Count of the Saxon shore; which office seems to have been preserved by the British monarchs who governed here, after the Romans quitted the isle. The Saxon kings of Kent discharged this trust in their regal capacity, from the middle of the fifth to the beginning of the ninth century. Under the northern princes, this post was again revived, though with a change of title, in the *Lord Warden of the Cinque Ports*. Indeed, under all governments, the people of Kent have been especially confi-

dered; as appears from their claim to the post of honour in our land-armies, and the privileges granted to their havens, in consideration of their undertaking the defence of our channel.

As to the climate of this county, it varies, according to the situation of places. In the low flat lands, and especially in the marshes, the air is heavy, moist, and unhealthy; and yet not to such a degree as it has been sometimes represented; for, with a little care and caution, strangers, as well as natives, quickly reconcile their constitutions to the temperature even of these parts, and live in them without much inconvenience or apparent danger. But, in reference to the rest of the county, the air is as thin, pure, and wholesome, as in any part of Britain. There is no region more happily or more beautifully diversified in regard to soil, so that every kind thereof is, somewhere or other, to be met with in its bounds; and in no shire are any of these soils more fertile than they are in this. The Weald yields variety of fine timber, particularly of chefnut; the middle part has very rich arable land, annually bearing every species of grain in immense plenty, and these excellent in their several sorts. There are also many beautiful orchards, which produce a variety of fine fruits, and more especially apples and cherries, which were introduced here from Flanders, by one Richard Harris, who was the king's fruiterer, in the reign of Henry VIII. The flat country is renowned for its meadows; and Romney-marsh has hardly its equal. We may, from this concise description, very easily collect, that the natural products of Kent are numerous, and of great value. In the bowels of the earth they find, in several places, a rough hard serviceable stone for paving, which turns to some advantage; but not so much as their exquisite fullers-earth, rich marl, and fine chalk, which are there in abundance. If we except iron ore, indeed, they have no mines; but there are prodigious heaps of copperas-stones thrown on the coast. The isle of Shepey, and all the adjacent shore as far as Reculver, is justly famous for its wheat. Thanet is in no less credit for its barley, or rather was so; for now it produces, thro' the painful industry and skilful husbandry of its inhabitants, copious crops of good wheat as well as barley. Horses, black cattle, and sheep, they have in great numbers, and remarkable in point of size; and hop-grounds in all parts of the county, which turn to very considerable account. To which we may add, weld, or, as some call it, *dyers-weed*, which is a very profitable commodity, and of which there grows much in the neighbourhood of Canterbury; also madder, which is, or has been, occasionally cultivated. The rivers and sea-coasts abound with fish of different kinds. The excellency of its oysters on the eastern shore, is celebrated by the Roman poets. Those of Feverham and Milton are not only in great esteem at the London market, but are likewise sent in great quantities to Holland.

The many rich commodities produced in this county, is the reason why most of our writers have represented it as in a manner void of manufactures; which, however, as appears upon a strict and impartial examination, is very far from being the case. Of iron-works there were anciently many; and there are still some, where kettles, bombs, bullets, cannon, and such like,

Campbell's  
Political  
Survey.

K. ent.

are made. At Deptford, Sir Nicholas Crispe had, in his life-time, a very famous copperas work; as, indeed, there that ingenious gentleman, one of the greatest improvers and one of the most public-spirited persons this nation ever bred, introduced several other inventions. Copperas was also formerly made, together with brimstone, in the life of Sheepee \*. But the original, and for many ages the principal manufacture of this county, was broad cloth of different colours, established chiefly at Cranbrook by king Edward III. who brought over Flemings to improve and perfect (the trade being introduced long before) his subjects in that important art. At this, and other places, it flourished so much, that even at the close of queen Elisabeth's reign, and, according to some accounts, much later, the best for home consumption, and the largest quantities for exportation, were wrought here; many fulling-mills being erected upon almost every river, and the greatest plenty of excellent fullers-earth affording them singular assistance; inasmuch, that it is still a tradition, that the yeomenry of this county, for which it has been ever famous, were mostly the descendants of rich clothiers, who laid out the money acquired by their industry in the purchase of lands, which they transmitted, with their free and independent spirit, to their posterity. The Duke of Alva's persecution of the Protestants in the Low Countries, drove a multitude of Walloons over hither, who brought with them that ingenuity and application for which they had been always distinguished. These diligent and active people settled a manufactory of flannel or baize at Sandwich. By them the silk-looms were set up at Canterbury, where they still subsist; and they also introduced the making of thread at Maidstone, where it yet remains, and merits more notice and encouragement than hitherto it has met with.

Upon the river Dart, at the confluence of which with the Thames stands the town of Dartford, was set up, in the reign of queen Elisabeth, the first mill for making white paper, by Mr John Spilman, a German, upon whom, long after, king James conferred the honour of knighthood; but king Charles more sensibly bestowed upon this Sir John Spilman a patent, and a pension of 200 l. a-year, as a reward of his invention, and for the support of the manufactory. About the year 1590, Godfrey Box, a German, erected upon the same river the first slitting-mill which was ever used for making iron-wire; and also the first battery-mill for making copper-plates. Other new inventions, requiring the assistance of water, have been set up on other streams; and a great variety of machines of this sort still subsist in different parts of this county. But these things are now so common, that it would be both tedious and useless to insist upon them. Amongst these, we may reckon the making gunpowder in several places. That manufactory, however, which is now the glory of this county, and indeed of Britain, is ship-building; more especially at the royal yards; as at Woolwich, which was settled by Henry VIII. and some considerable ships built there. At present, there is not only a most complete establishment for the building and equipping men of war, a rope-walk, foundry, and magazines; but also many private docks, in which prodigious business is carried on, and multitudes of people employed.

1059.

KEPLER (John), one of the greatest astronomers of his age, was born at Wied, in the country of Württemberg, in 1571. In the year 1595, he wrote an excellent book, which was printed at Tübingen the year following, under the title of *Prodromus dissertationum de proportionibus orbium celestium, deque causis eorum numerum, magnitudinis, motuumque periodicorum genuinis et propriis*, &c. Tycho Brahe having settled in Bohemia, and obtained from the emperor all sorts of conveniences for the perfecting of astronomy, was so passionately desirous of having Kepler with him, and wrote so many letters to him on that subject, that he prevailed upon him to leave the university of Gratz, and remove into Bohemia with his family and library, in the year 1600. Kepler in his journey was seized so violently with the quartan ague, that he could not do Tycho Brahe all the services of which he was before capable. He was even a little dissatisfied with the reservedness which Tycho Brahe shewed towards him; for the latter did not communicate to him all he knew; and as he died in 1601, he did not give time to Kepler to be very useful to him, or to receive any considerable advantage under him. From that time Kepler enjoyed the title of *Mathematician to the emperor*, all his life; and gained more and more reputation by his works. The emperor Rodolphus ordered him to finish the tables of Tycho Brahe, which were to be called the *Rodolphine Tables*. Kepler applied himself to it vigorously; but unhappy as those learned men who depend upon the good-humour of the intendants of the finances. The treasurers were so ill-affected toward our author, that he could not publish these tables till 1627. He died at Ratibon, where he was soliciting the payment of the arrears of his pension in 1630.

The principal works of this great astronomer are, 1. *Prodromus dissertationum*, above mentioned, to which he has also given the title of *Mysterium Cosmographicum*; which he esteemed more than any other of his works, and was for some time so charmed with it, that he said he would not give up the honour of having invented what was contained in that book for the electorate of Saxony. 2. *Harmonia mundi*, with a defence of that treatise. 3. *De cometis, libri tres*. 4. *Epitome astronomiæ Copernicanae*. 5. *Astronomia nova*. 6. *Chilias logarithmorum*, &c. 7. *Novo stereometriæ doliurum vinariorum*, &c. 8. *Dioptrice*. 9. *De vero natali anno Christi*. 10. *Ad Vitellionem Paralipomena*, quibus *Astronomiæ pars optica traditur*, &c. 11. *Somnium Lunarijæ Astronomiæ*; in which he began to draw up that system of comparative astronomy which was afterwards pursued by Kircher, Huygens, and Gregory. His death happened while the work was printing: upon which James Bartschius, his son-in-law, undertook the care of the impression; but was also interrupted by death: and Lewis Kepler his son, who was then a physician at Königsberg in Prussia, was so much startled at these disasters, that it was with the utmost difficulty he could be prevailed upon to attempt to finish it, lest it should prove fatal to him: he completed the task, however, without receiving any personal injury.

KERCKRING (Theodore), a famous physician of the 17th century, was born at Amsterdam, and acquired a great reputation by his discoveries and his works.

Kepler,  
Kerckring

Kerman,  
Kermes.

Kermes.

works. He found out the secret of softening amber without depriving it of its transparency; and made use of it in covering the bodies of curious insects, in order to preserve them. He was a member of the Royal Society of London; and died in 1693 at Hamburg, where he had spent the greatest part of his life, with the title of *resident of the grand duke of Tuscany*. His principal works are, 1. *Spicilegium anatomicum*. 2. *Anthropogenia ichnographia*. There is also attributed to him an anatomical work, printed in 1671, in folio.

KERMAN, the capital city of a province of that name in Persia, seated in E. Long. 56. 30. N. Lat. 30. 0. The province lies in the south part of Persia, on the Persian gulph. The sheep of this country, towards the latter end of the spring, shed their wool, and become as naked as suckling pigs. The principal revenue of the province consists in these fleeces.

KERMES, in zoology, the name of an insect produced in the excrecences of a species of the oak.

*Kermes*, among the Arabians, signifies a small worm; and *κέρκος* among the Greeks, whence the Latin word *coccum*, both which mean a kernel or grain: for which reason, among the later Greeks, instead of the word *κέρκος*, the word *κρυάνη*, a quorn, is substituted; for these grains are full of small worms, the juice of which affords the scarlet colour and dye. Hence the worm is taken for the grain itself.

The kermes appears at first wrapped up in a membranaceous bladder, of the size of a pea, smooth and shining, of a brownish red colour, and covered with a very fine ash-coloured powder. This bag teems with a number of reddish eggs or insects, which, being rubbed with the fingers, pour out a crimson liquor. It is only met with in warm countries in the months of May and June. In the month of April this insect becomes of the size and shape of a pea; and its eggs some time after burst from the womb, and, soon turning into worms, run about the branches and leaves of the tree. They are of two sexes, and the females have been hitherto described: but the males are very different from the former; and are a sort of small flies like gnats, with six feet, of which the four forward are short, and the two backward long; divided into four joints, and armed with three crooked nails. There are two feelers on the head, a line and a half long, which are moveable, streaked, and articulated. The tail at the back part of the body is half a line long, and forked. The whole body is covered with two transparent wings, and they leap about in the manner of bees. The harvest of the kermes is greater or less in proportion to the severity of the winter. The women gather them before sun-rising, tearing them off with their nails, for fear there should be any loss from the hatching of the insects. They sprinkle them with vinegar, and lay them in the sun to dry, where they acquire a red colour.

KERMES Mineral, so called from its colour, which resembles that of vegetable kermes, is one of the most important antimonial preparations, both with regard to its chemical phenomena and to its medicinal uses.

The use of kermes-mineral was not established in medicine before the beginning of this century. Some chemists, indeed, amongst others Glauber and Lemer,

had before that time mentioned in their works several preparations of antimony which approach more or less to kermes; but these preparations being little known, were confounded with many others which are entirely neglected, although much praised by their authors.—The fame of kermes was occasioned by friar Simon, apothecary to the Chartreux friars. He received this preparation from a surgeon called *La Ligerie*, who had procured it from a German apothecary who had been a scholar of the famous Glauber. Friar Simon, from the commendations given to this new remedy by *La Ligerie*, administered it to a Chartreux friar, who was dangerously ill of a violent peripneumony, by which the friar was suddenly, and as it had been miraculously, cured. From that time the friar-apothecary published the virtue of his remedy. Several other remarkable cures were performed by means of kermes. The public believed in its medicinal qualities, and called it *powder of Chartreux*; because it was prepared only in the apothecary's shop belonging to these monks. The reputation of kermes extended itself more and more; till at length the duke of Orleans, then regent of France, procured the publication of the process by *La Ligerie*.

This process consists in boiling, during two hours, pulverised crude antimony in the fourth part of its weight of the liquor of nitre fixed by coals, and twice its weight of pure water: at the end of this time the liquor is to be decanted and filtrated, while boiling, through brown paper. It continues clear while it is boiling hot; but when it cools, it becomes turbid, acquires a red brick colour, and again becomes clear by the deposition of a red sediment, which is the kermes. The boiling may be thrice repeated, and each time the same quantity of water is to be added to the antimony, and a fourth part less of the liquor of fixed nitre. The several sediments from these three boilings are to be added together, washed with clean water till the water acquires no taste; and the kermes is then to be dried. *La Ligerie* directs, that aquavite shall be once or twice poured upon it and burnt, and the kermes dried again.

We now proceed to explain the nature of kermes, and the phenomena of its preparation.—Crude antimony is composed of regulus of antimony and common sulphur, united naturally with each other, as in almost all metallic minerals. The fixed alkali with which the crude antimony is boiled, although it is diluted with much water, acts upon the sulphur of the antimony, and forms with it liver of sulphur; and as this compound is a solvent of all metallic matters, it dissolves a certain quantity of the regulus of antimony. In this operation then a combination is formed of fixed alkali, of sulphur, and of regulus of antimony. Of these three substances the fixed alkali only is soluble in water, and is the intermediate substance by which the sulphur and regulus are suspended in the water. But we are to observe, that the alkali becomes impregnated by this operation, and by boiling, with a larger quantity of regulus, and especially of sulphur, than can be suspended in cold water; hence the decoction of kermes, which is clear, limpid, and colourless while boiling hot, becomes turbid and deposits a sediment while it cools.

This

**Kermes.** This compound, therefore, like certain salts, may be kept dissolved in larger quantity by hot than by cold water, and much of it is therefore deposited by cooling.

Further, while the kermes is precipitating, the whole antimoniated liver of sulphur, which is dissolved by the boiling liquor, may be divided into two parts; one of which, that is the kermes, being overcharged with the regulus, and particularly with the sulphur, contains but a little alkali, which it draws along with it during its deposition. The other part, as it contains much more alkali, remains dissolved even in the cold liquor, by means of this larger quantity of alkali. All these propositions are to be explained and demonstrated by the following observations.

First, when the decoction of kermes is cold, and has formed all its sediment, if, without adding any thing to it, it be heated till it boil, it again entirely re-dissolves the kermes; the sediment disappears; the liquor becomes clear, and by cold is again rendered turbid and deposits sediment as before. Thus the kermes may be made to precipitate and to re-dissolve as often as we please.

Secondly, by digesting kermes in aqua-regia, which dissolves its alkali and regulus, the sulphur is separated pure. The acids of aqua-regia form a nitre and a febrifugal salt of Sylvius with the alkali of the kermes; and if a certain quantity of kermes be melted with black flux after having destroyed its sulphur by roasting, a true regulus of antimony may be obtained from it.

These experiments, which were made by Mr Geoffroy, and the detail of which is found in memoirs given to the Academy in the years 1734 and 1735, upon the analysis of kermes, shew evidently the presence of sulphur, of fixed alkali, and of regulus of antimony, in this compound. From Mr Geoffroy's experiments we find, that 72 grains of kermes contain about 16 or 17 grains of regulus, 13 or 14 grains of alkaline salt, and 40 or 41 grains of common sulphur.

Thirdly, by repeating the boiling of the liquor upon the antimony, more and more kermes will be formed each time by cooling, as at first; and this experiment may be repeated a great many times. Mr Geoffroy says, that he repeated it 78 times, without any other addition than that of pure water to supply that which was lost by evaporation; and that each time a considerable quantity of kermes was formed by cooling. This experiment proves, that the alkali transforms the antimony into kermes by overcharging itself with regulus and sulphur, and at each precipitation the kermes does not retain and take with it but a very small quantity of alkali.

Fourthly, if any acid be poured upon the liquor in which the kermes has been formed, and from which it has been entirely separated by cooling, Mr Beaume has observed, that this liquor is again rendered turbid, and that a second sediment is formed of a yellow reddish colour, which is nothing else than golden sulphur of antimony; that is, regulus of antimony and sulphur mixed together, but in very different proportions, and with very different strengths of union, from those in which they are found in the crude antimony.

After this precipitation, in the liquor a neutral salt

is left, which is formed by the contained alkali and the precipitating acid. From this experiment we find, that in the liquor from which the kermes has been deposited, a considerable quantity of antimoniated liver of sulphur remains, which differs from kermes by containing a much larger proportion of alkali; so that it can keep dissolved the regulus and sulphur with which it is united, even when the liquor is cold.

In the process for several antimonial preparations, a kermes, or compounds like it, are formed. This always happens when crude antimony is treated by fusion with a quantity of alkaline salt, so that an antimoniated liver of sulphur results from it, overcharged with regulus and sulphur; that is, containing more of these two substances than it can keep dissolved in cold water. If any of these combinations be boiled in water, a matter analogous to kermes is always deposited by cooling. This happens, for instance, to the scoria of the regulus of antimony, and in an operation described by Mr Geoffroy to abridge the process for making kermes by fusion.

To make kermes by fusion, Mr Geoffroy fuses two parts of antimony with one part of alkaline salt; he powders this matter while yet hot, and keeps it during two hours in boiling water; he then filtrates it, and receives the liquor into more boiling water, from which, when it cools, about six gros of kermes is deposited, when an ounce of antimony has been used. This method of making kermes is much more expeditious, but less perfect; for, as the author confesses, the kermes produced is not so fine and soft as that made in the ordinary method.

Mr Lemerier the elder mentions also, in his Treatise concerning Antimony, an operation from which his son pretends that kermes may be obtained. This operation consists in digesting, and afterwards boiling, powdered crude antimony in a very pure liquor of fixed nitre. This liquor, if it be in sufficient quantity, is capable of dissolving, quickly and entirely, powdered crude antimony; and we cannot doubt but that, by cooling, a considerable quantity of a substance very analogous to kermes will be produced. Nevertheless, none of these short methods of making kermes is directed by dispensatories, or by the best books for describing the preparations of chemical remedies.

Kermes is used in medicine only; and from it singularly excellent effects may be produced, when administered by able physicians. In kermes are united the exciting and evacuant virtues of the emetic preparations of antimony, with the tonic, dividing, aperitive, and resolving properties of the liver of sulphur; that is to say, that it is capable of answering two principal indications in the treatment of many acute and chronic diseases. Properly managed, it may become an emetic, purgative, a diuretic, a sudorific, or an expectorant, as is required, and it is always attenuating and resolving. When seven or eight grains are taken at once, it chiefly acts upon the primæ viæ, generally as an emetic and as a purgative. A dose of three or four grains is seldom emetic, and more frequently purgative. When taken in these quantities as an evacuant, a little of it passes also into the viæ secundæ & tertiæ. When it is administered in smaller doses, it passes almost entirely into the lacteal, blood, and lymphatic vessels. In these it occasions such spasms and oscillations

Kern,  
Kerry.

tions as it does in the primæ viæ; so that it increases all secretions and excretions, but particularly those of urine, sweat, and expectoration, according to the dose, to the nature of the disease, and to the disposition of the patient. It produces very good effects in those diseases of the breast which proceed from fullness and obstruction.

Kermes may be administered in liniments, in oily or in cordial potions, in any vehicle; or incorporated in a bolus, with other suitable remedies. One precaution, hitherto little observed, is very necessary; that is, not to join it with acid matters, if it is intended to act as kermes. Anti-acid and absorbent substances ought to be joined with it, if the patient has an acid in the primæ viæ, or an acceftent disposition; for as these acids saturate the alkali by which the kermes is rendered an antimoniated liver of sulphur, and by which alone it differs from golden sulphur of antimony, they accordingly render the kermes entirely similar to the golden sulphur of antimony, the properties of which are very different from those of kermes.

KERN, or KERNE, a term in the ancient Irish militia, signifying a *foot-soldier*.—Camden tells us, the armies of Ireland consisted of cavalry, called *galloglas-fes*; and infantry, lightly armed, called *kernes*.—The kernes bore swords, and darts; to the last were fitted cords, by which they could recover them, after they had been lanced out.

KERNES, in our laws, signify idle persons, or vagabonds.

KERRY, a county of Ireland, in the province of Munster, bounded on the north by the river Shannon, which divides it from Clare; on the east, by Limerick and Cork; on the south, by another part of Cork; and on the west, by the Atlantic ocean. This county is diversified with high hills and fruitful vales; and in the middle there is a lake called *Lough Lean*, which is several miles in compass, and falls into the ocean thro' a little river of the same name. Some of the mountains produce very fruitful pastures, whose grass is high and good. The sheep and cattle feed there in the summer; but in the winter the ground becomes so spongy and boggy, that it will not bear a man. The coast of this county has several gulphs and promontories. That on the north has the name of the county; and is covered with such high mountains, that they may be seen at 50 miles off. These are called *Brandon Hills*. Near its extremity are two good havens; that on the north is called *Smirwick*, and that on the south *Dingle*. The town so called has a good haven; from whence it has its name, and is covered with a large rock. The bay of Dingle is long, broad, entering several miles into the country, and has two or three good havens; that of Ventry is four miles to the west of Dingle, and that of Castlemagne is at the bottom of the bay. Ardara is the capital town, and is a bishop's see. The second promontory is Glancara, or Glencara, seated between the bay of Dingle and that of Maire; it has a long chain of mountains, and Lough-Lean communicates as well with the bay of Dingle as of Maire, by two small rivers which form an island. There is a small island hereabouts called *Valencia*, defended by a fort. The bay of Maire has its name from a small river; and is narrower than that of Dingle, tho' it runs farther into the country.

Kessel  
||  
Ketch.

KESSEL, a town of Upper Guelderland, in the Netherlands, with a handsome castle. It is the chief town in the territory of the same name, and seated on the river Meuse, between Ruremond and Venlo, it being about five miles from each. It was ceded to the king of Prussia, by the treaty of Utrecht. E. Long. 6. 13. N. Lat. 41. 22.

KESSELDORF, a village of Germany, in the circle of Upper Saxony, three miles below Dresden, remarkable for the battle gained by the king of Prussia over the Saxons, on the 15th of December 1745.

KESWICK, a town of Cumberland, situated on the side of a lake, in a fruitful plain, almost encompassed with mountains, called the *Tenrcent Fells*. It was formerly a town of good note, but now is much decayed. However, it is still noted for its mines and miners, who have a convenient smelting-house on the side of the river Derwent, the stream of which is so managed, as to make it work the bellows, hammers, and forge, as also to saw boards. There is a work-house here for employing the poor of this parish, and that of Crosthwait. W. Long. 3. O. N. Lat. 54. 30.

KETTLE, in the art of war, a term the Dutch give to a battery of mortars, because it is sunk under ground.

Kettle-Drums, are formed of two large basins of copper or brass, rounded at the bottom, and covered over with vellum or goat-skin, which is kept fast by a circle of iron, and by several holes fastened to the body of the drum, and a like number of screws to screw up and down, and a key for the purpose. The two basins are kept fast together by two straps of leather which go through two rings, and are fastened the one before and the other behind the pommel of the kettle-drums saddle. They have each a banner of silk or damask, richly embroidered with the sovereign's arms, or with those of the colonel, and are fringed with silver or gold; and, to preserve them in bad weather, they have each a cover of leather. The drumsticks are of crab-tree or of any other hard wood, of eight or nine inches long, with two knobs on the ends, which beat the drum-head and cause the sound. The kettle-drum with trumpets is the most martial found of any. Each regiment of horse has a pair.

Kettle-Drummer, a man on horseback appointed to beat the kettle-drums, from which he takes his name. He marches always at the head of the squadron, and his post is on the right when the squadron is drawn up.

KETTLEWELL (John), a learned divine, born in 1653, was descended from an ancient family in the North-riding of Yorkshire, bred in Edmund-Hall Oxford, and elected fellow of Lincoln-college. In 1675, he went into orders; but after the revolution was deprived of his living, on account of his refusal to take the oaths to king William and queen Mary. He died of a consumption in 1695. He published several works, which were collected and reprinted together in 1718, in 2 vols folio. He was a man of great candour, meekness, piety, and charity.

KETCH, a vessel equipped with two masts, viz. the main-mast and mizen-mast, and usually from 100 to 250 tons burden.—Ketches are principally used as yachts, or as bomb-vessels; the former of which are employed to convey princes of the blood, ambassadors,

or

Kevels  
||  
Key.

or other great personages, from one part to another; and the latter are used to bombard citadels, towns, or other fortresses. The bomb-ketches are therefore furnished with all the apparatus necessary for a vigorous bombardment; they are built remarkably strong, as being fitted with a greater number of *riders* than any other vessel of war; and indeed this reinforcement is absolutely necessary to sustain the violent shock produced by the discharge of their mortars, which would otherwise in a very short time shatter them to pieces.

KEVELS, in ship-building, a frame composed of two pieces of timber, whose lower ends rest in a sort of step or foot, nailed to the ship's side, from whence the upper ends branch outward into arms or horns, serving to belay the great ropes by which the bottoms of the main-mast and fore-mast are extended.

KEW, a village of Surry in England, opposite to Old Brentford, 10 miles west from London. Here is a seat which belonged to the late prince of Wales. Of late years a considerable extent of ground has been taken into the gardens of Kew, which are agreeably laid out in lawns, walks, and groves, embellished with temples, alcoves, and a very lofty brick tower, in the Chinese style of architecture. On Kew-green are a great number of elegant country-houses, belonging to the royal family, and other persons of distinction.

KEXHOLM, that part of Finland which borders upon Russia. The lake Ladoga crosses it, and divides it into two parts. By the treaty between Russia and Sweden in 1721, the Swedes were obliged to abandon the best part to the Russians. The country in general is full of lakes and marshes, thinly inhabited, and badly cultivated. The lake abovementioned is 120 miles in length, and full of fish.

KEXHOLM, or *Carelgorod*, a town of Russia, in a territory of the same name, not very large, but well fortified, and has a strong castle. The houses are built with wood. It formerly belonged to the Russians, after which the Swedes had possession of it for a whole century; but it was re-taken by the Russians in 1710. Near it is a considerable salmon-fishery. It is seated on two islands on the north-west side of the lake Ladoga, in E. Long. 30. 25. N. Lat. 61. 12. Near it is another town called *New Kexholm*.

KEY, an instrument for the opening of locks. See *Lock*.

L. Molinus has a treatise of keys, *De clavibus veterum*, printed at Upsal: he derives the Latin name *clavis*, from the Greek *κλειδο*, *clau-do*, "I shut;" or from the adverb *clam*, "privately;" and adds, that the use of keys is yet unknown in some parts of Sweden.

The invention of keys is owing to one Theodore of Samos, according to Pliny and Polydore Virgil: but this must be a mistake, the use of keys having been known before the siege of Troy; mention even seems made of them in the 19th chapter of Genesis.

Molinus is of opinion, that keys at first only served for the untying certain knots, wherewith they anciently secured their doors: but the Laconic keys, he maintains, were nearly akin in use to our own; they consisted of three single teeth, and made the figure of an E; of which form there are still some to be seen in the cabinets of the curious.

There was another key called βαλανιστρα, made in the

Key,  
Keyier.

manner of a male-screw; which had its corresponding female in a bolt affixed to the door. Key is, hence, become a general name for several things serving to shut up or close others.

Key, or *Key-stone*, of an Arch or Vault, is the last stone placed a-top thereof; which being wider and fuller at the top than bottom, wedges, as it were, and binds all the rest. The key is different in the different orders: in the Tuscan and Doric, it is a plain stone, only projecting; in the Ionic, it is cut, and waved somewhat after the manner of consoles; in the Corinthian and Composite, it is a console, enriched with sculpture, foliages, &c.

Key is also used for ecclesiastical jurisdiction; particularly for the power of excommunicating and absolving. The Romanists say, the pope has the power of the keys, and can open and shut Paradise as he pleases; grounding their opinion on that expression of Jesus Christ to Peter, "I will give thee the keys of the kingdom of heaven." In St Gregory we read, that it was the custom heretofore for the popes to send a golden key to princes, wherein they inclosed a little of the filings of St Peter's chains, kept with a world of devotion at Rome; and that these keys were worn in the bosom, as being supposed to contain some wonderful virtues.

Key is also used for an index or explanation of a cipher. See *CIPHER*.

KEYS of an Organ, *Harpsichord*, &c. those little pieces in the fore-part of those instruments, by means whereof the jacks play, so as to strike the strings. These are in number 28 or 29. In large organs there are several sets of the keys, some to play the secondary organ, some for the main-body, some for the trumpet, and some for the echoing trumpet, &c.; in some there are but a part that play, and the rest are only for ornament. There are 20 slits in the large keys, which make half-notes. See the article *ORGAN*, &c.

KEY, in music, a certain fundamental note or tone, to which the whole piece, be it in cantata, sonata, concerto, &c. is accommodated, and with which it usually begins, but always ends.

Key, or *Quay*, a long wharf, usually built of stone, by the side of a harbour or river, and having several storehouses for the convenience of lading and discharging merchant-ships. It is accordingly furnished with posts and rings, whereby they are secured; together with cranes, capsterns, and other engines, to lift the goods into or out of the vessels which lie along-side.

The verb *cajare*, in old writers, according to Scaliger, signifies to keep in, or restrain; and hence came our term *key* or *quay*, the ground where they are made being bound in with planks and posts.

Keys are also certain funken rocks, lying near the surface of the water, particularly in the West-Indies.

KEYSER'S PILLS, a celebrated mercurial medicine, the method of preparing which was purchased by the French government, and has since been published by M. Richard.

The first, and what, according to Mr Keyser, is the most essential operation, consists in separating the mercury very exactly from all heterogeneous matter, by reducing it to an æthiops. This is effected by means

of

Keyfer.

of an hydraulic machine, a plan of which Mr Keyfer intended to have given to government before his death: but, although he did not live to accomplish his resolution, his family still offer to do it when desired. According to the description given by M. Richard, this machine consists of a number of buckets, in which mercury is triturated with water, till the water acquires a black colour. This water, upon standing, deposits a sediment, which, being dried by a proper heat, is the æthiops required.

The second process consists in revivifying the mercury by distillation, in freeing it from all oily matters by means of quick-lime, in detaching this quick-lime by repeated washings, and afterwards in drying it by means of a sand heat.

The third operation consists in the reduction of the mercury purified by this process to a red calx, by means of heat. In conducting this operation, Mr Keyfer advises, that the mercury be put into glass matrases, a small quantity only in each. For the proper degree of heat, he directs those who would practise the operation, to consult Lemery, and other chemists.

The fourth operation is, the dissolution of the calcined mercury, obtained by the former process, in distilled vinegar, by means of triture. A pound of this mercury may be dissolved in eight pints of vinegar, by rubbing it, for an hour or two, in a mortar, which should be kept solely for that purpose. Care must also be taken that the vinegar be not distilled in a metallic, but in a glass vessel.

The fifth process consists in the intimate mixture of this vinegar, impregnated with mercury, with manna. Each pound of the vinegar, containing about two ounces of mercury, will require two pounds of manna. They must be rubbed together upon marble stones, till they acquire a uniform consistence, which will be liquid to such a degree as to pass thro' a hair-cloth, for separating the impurities of the manna. After being managed in this manner, it must be spread upon a marble slab, and left to dry there, without the assistance of fire, till it acquires such a consistence as not to run off upon the table being turned to its side. It must then be placed before the fire, and at the same time moved from one part of the stone to another, by means of a knife, furnished with a large plant blade. By this means, it is perfectly prepared for forming the pills.

The sixth and last process consists in the formation of the mafs thus prepared into pills. These Mr Keyfer made to weigh either three grains, or a grain and a half, the first for robust, the last for delicate constitutions.

To this account given for the preparation of these pills, Mr Keyfer has added some reflections, by way of supplement. He observes, that, by the purification of the mercury from distillation, a great quantity of heterogeneous matter is separated from it. This, however, by no means frees it completely from all foreign matter. And, as mercury purified, upon being calcined and dissolved in vegetable acid, is a much more powerful medicine than mercury calcined without purification, he concludes, that repeated purifications would render it still more active.

Another remark which he gives, respects the dissolution of the mercurius calcinatus in the distilled vine-

gar. He observes, that the mercury thus dissolved may be made to unite with running mercury, and to form a very singular product. He formerly mentioned, that a pound of this mercurius calcinatus was to be dissolved in eight pints of vinegar. If to this be added two pounds of running mercury, and the agitation continued, a substance will arise to the surface in the form of cream. This being removed by the assistance of a wooden spoon, more will continue to rise as long as the agitation is continued. The cream being dried, and incorporated with manna, in the proportion of one part of the cream to eight of manna, forms a very useful purgative, and is said to be an effectual remedy against recent venereal complaints, particularly against chancres.

Mr Richard concludes his account of Keyfer's pills with observing, that he considers it to be, without exception, the most effectual remedy for the venereal disease hitherto discovered. But, before entering upon the detail, he remarks, that it is his opinion the process may be much abridged, without diminishing the efficacy of the medicine. He judged it proper, however, to deliver to the public the method of preparing the pills in Mr Keyfer's own words; and he has not afterwards pointed out the improvements he proposes.

KEYSLER (John George), a learned German antiquarian, was born at Thourneau, in 1689. After studying at the university of Halle, he was appointed preceptor to Charles Maximilian, and Christian Charles, the young counts of Giech Buchau; with whom he travelled through the chief cities of Germany, France, and the Netherlands, gaining great reputation among the learned as he went along, by illustrating several monuments of antiquity, particularly some fragments of Celtic idols lately discovered in the cathedral of Paris. Having acquitted himself of this charge with great honour, he procured, in 1716, the education of two grandsons of Baron Bernstorff first minister of state to his Britannic majesty as elector of Brunswick Lunenburg. However, obtaining leave, in 1718, to visit England, he was elected a fellow of the Royal Society for a learned essay *De Dea Nehelennia numine veterum Walachorum topico*: he gave also an explanation of the ancient monument on Salisbury plain called *Stone-henge*, with *A dissertation on the consecrated mistletoe of the Druids*. Which detached essays, with others of the same kind, he published on his return to Hauover, under the title of *Antiquitates selectæ Septentrionales et Celticæ*, &c. He afterwards made the grand tour with the young barons, and to this tour we owe the publication of his travels; which were translated into English, and published in 1756, in 4 vols 4to. Mr Keyser, on his return, spent the remainder of his life under the patronage of his noble pupils, who committed their fine library and museum to his care, with a handsome income. He died in 1743.

KIAM, a great river of China, which takes its rise near the western frontier, crosses the whole kingdom eastward, and falls into the bay or gulph of Nanking, a little below that city.

KIBURG, a town of the canton of Zurich in Switzerland, with a castle; seated on the river Thecfl, in E. Long. 8. 50. N. Lat. 47. 20.

KIDDER (Dr Richard), a learned English bi-

Keyfer  
||  
Kidder.

Kidder-  
minster.  
Kiggelaria.

shop, was born in Suffex, and bred at Cambridge. In 1689, he was intalled dean of Peterborough; and in 1691, was nominated to the bishopric of Bath and Wells, in the room of Dr Thomas Ken, who had been deprived for not taking the oaths to king William and queen Mary. He published, 1. The young man's duty. 2. A demonstration of the Messiah, 3 vols 8vo. 3. A commentary on the five books of Moses, 2 vols 8vo, and several other pious and valuable tracts. He was killed, with his lady, in his bed, by the fall of a stack of chimneys, at his house in Wells, during the great storm in 1703. The bishop, in the dissertation prefixed to his commentary on the five books of Moses, having reflected upon Monsieur Le Clerc, some letters passed between them in Latin, which are published by Le Clerc in his *Bibliothèque Choisie*.

KIDDERMINSTER, or KEDDERMINSTER, a town of Worcestershire. It is governed by a bailiff, 12 capital burgesses, and 24 common-council-men. It has a good free school, and two alms-houses; and drives a considerable trade in a manufacture called *Kidderminster-stuff*, and *carpets*. It is seated under a hill, on the river Stour, not far from the Severn; and is a compact town, and well inhabited. W. Long. 2. 15. N. Lat. 52. 28.

KIDNAPPING, the forcible abduction or stealing away of man, woman, or child, from their own country, and sending them into another. This crime was capital by the Jewish law: "He that stealeth a man and selleth him, or if he be found in his hand, shall surely be put to death \*." So likewise in the civil law, the offence of spiriting away and stealing men and children, which was called *plagium*, and the offenders *plagiarii*, was punished with death. This is unquestionably a very heinous crime, as it robs the king of his subjects, banishes a man from his country, and may in its consequences be productive of the most cruel and disagreeable hardships; and therefore, the common law of England has punished it with fine, imprisonment, and pillory. And also the statute 11 and 12 W. III. c. 7. though principally intended against pirates, has a clause that extends to prevent the leaving of such persons abroad as are thus kidnapped or spirited away; by enacting, that if any captain of a merchant-vessel shall (during his being abroad) force any person on shore, or wilfully leave him behind, or refuse to bring home all such men as he carried out, if able and desirous to return, he shall suffer three months imprisonment.

KIDNEYS, in anatomy. See there, n° 362.

KIDNEY Bean. See PHASEOLUS.

KIEL, a city of Germany, in the duchy of Holstein, in the circle of Lower Saxony, and the residence of the duke of Holstein Gottorp. It has a castle, and a university founded in 1665; and there is a very celebrated fair held here. It is seated at the bottom of a bay of the Baltic Sea, called *Killerwick*, at the mouth of the river Schwentin, in E. Long. 10. 17. N. Lat. 54. 26.

KIGGELARIA, in botany, a genus of the decandria order, belonging to the diœcia class of plants. There is but one species, viz. the Africanæ. It hath an upright woody stem, and purplish branches, growing 15 or 18 feet high; oblong, fawed, alternate leaves; and diœcious, greenish-white flowers, in clus-

ters from the sides of the branches; succeeded by globular rough fruit, the size of cherries, containing the seeds, which seldom ripen here. As this is a native of warm climates, it must be constantly kept in a stove in this country. It is propagated by seeds, layers, or cuttings, though most readily by seeds.

KILARNEY, a small town in the county of Kerry in Ireland, which gives name to a lake, one of the most beautiful, perhaps, in the world. This lake, which may not improperly be distinguished into three, the upper, lower, and middle, excepting one narrow valley on the fourth, through which a river runs into the upper lake, is surrounded with one continued range of lofty mountains, rocks, and precipices, the immense declivities of which are covered with woods intermixed with ever-greens, from nearly their tops down to the verge of the lakes; add to this the number of rivulets cascading from channels skirted with trees of every kind down the sides of these enormous mountains, some of them to the height of 100 yards. Over the lake are dispersed a great number of islands of very different extent; and all of them of any size, (one only excepted, which is inhabited by an innumerable sight of rabbits,) beautifully ornamented with trees of every kind, with a most delightful intermixture of ever-greens, as box, holly, yew, and the arbutus or strawberry-tree. Hollies of a prodigious magnitude are found here, some of above two feet diameter in the body of the tree. The arbutus grows in great plenty and perfection on many of the islands; the largest of them are about six or seven inches in diameter, and 15 or 20 feet high. They appear in their greatest beauty and perfection about November. There is a most enchanting prospect from some of the surrounding mountains, particularly from a very lofty one called the *Turk*, because its white chalky top looks like a Turkish turban. On the very summit of one of the Mangertou mountains, in the neighbourhood, is a small round lake, of about a quarter of a mile diameter across the top, called the *devil's punch-bowl*. From the surface of the lake to the top of the sides of this vast concavity or bowl, may be about 300 yards; and when viewed from the circular top, it really has a most astonishing appearance. The depth of it, doubtless, is vastly great, but not, as the natives of it pretend, unfathomable. The discharge of the superfluous waters of this bowl, through a chasm or gap into the middle lake, forms one of the finest cascades in the world, visible for above 150 yards. The devil's punch-bowl, as it is called in our maps, is by the natives in the neighbourhood termed *Poulier Infrin*, that is, "the hole of hell." The echoes among the hills in the southern and more inclosed parts of the great lake, but especially in the winding, deep, and intricate valley leading from the lower to the upper lake, are equally delightful and astonishing. There are some cannon placed in the most advantageous situations by the lord Kenmare, a Roman Catholic nobleman, on purpose for the entertainment of travellers, who generally provide themselves with ammunition for loading them. The reports, on the discharge of these cannon, resemble the nearest of any thing in nature a most violent peal of thunder rolling among the mountains. Here also musical instruments, especially the horn and trumpet, afford the most delightful and ravishing enter-

Kilarney.

Kilmerney,  
Kilda.

Kilda.

tainment to the ear; and to a sportsman nothing can equal the spirit and elevating joy of a flag-hunt among the woods and mountains about the lake of Kilarny, where the cry of the hounds, the harmony of the horns resounding from the hills on every side, the universal shouts of joy along the valleys, and from the sides of the mountains, re-echoing from hill to hill, and from rock to rock, gives the highest satisfaction and delight that can possibly arise from the chase. The gentlemen who attend the hunt are generally in boats on the lake, during the diversion; for to follow it by land, either on foot or horseback, is impracticable. Among the high craggy inaccessible heights that surround the lakes, there is one stupendous and frightful rock, the front of which, to the water, is a most horrible precipice, called the *eagles nest*, from its being seldom without a nest of them upon its top. On the eastern side is a rich and fertile plain for two or three miles, through which descends a river into the lower lake; and through a valley at the west end, the whole collection of waters discharge themselves into the sea. On the north-east side stands the town of Kilmerney, in a delightful situation; and, in the summer-time, from the number of visitors to the lake, is a very cheerful lively town, it being as much the fashion in Ireland to visit this lake at that season, as it is elsewhere to go to drink the waters at the public spas, or to bathe in the sea. In the neighbourhood of the lake are a great many feats and villas, ruins, &c. Pearls of great value are sometimes found about the lake; salmon also are caught in great plenty and perfection, and sold at the moderate price of one penny per pound. The fishery is the property of the earl of Kenmare; to whom also belongs a great part, if not the whole, of the lake, with its beautiful islands. The bowels of the peninsula, between the upper and lower lakes, are fraught with mines of copper; and even silver, it is said, hath been extracted from them. They are prodigiously deep, and have been worked a great way under the lake.

KILDA (St), one of the Hebrides, or western islands of Scotland. It lies in the Atlantic ocean, about 58. 30. N. Lat.; and is about three English miles in length from east to west, and its breadth from south to north not less than two. The ground of St Kilda, like much the greatest part of that over all the Highlands, is much better calculated for pasture than tillage.—Refrained by idleness, a fault or vice much more pardonable here than in any other part of Great Britain, or discouraged by the form of government under which they live, the people of the island study to rear up sheep, and to kill wild-fowl, much more than to engage deeply in the more toilsome business of husbandry. All the ground hitherto cultivated in this island lies round the village. The soil is thin, full of gravel, and of consequence very sharp. This, though naturally poor, is, however, rendered extremely fertile, by the singular industry of very judicious husbandmen: these prepare and manure every inch of their ground, so as to convert it into a kind of garden. All the instruments of agriculture they use, or indeed require, according to their system, are a spade, a mall, and a rake or harrow. After turning up the ground with a spade, they rake or harrow it very care-

fully, removing every small stone, every noxious root or growing weed that falls in their way, and pound down every stiff clod into dust. It is certain that a small number of acres well prepared in St Kilda, in this manner, will yield more profit to the husbandman than a much greater number when roughly handled in a hurry, as is the case in the other Western isles. The people of St Kilda sow and reap much earlier than any of their neighbours on the western coast of Scotland. The heat of the sun, reflected from the hills and rocks into a low valley facing the south-east, much, in the summer-time, be quite intense; and however rainy the climate is, the corn much, for these reasons, grow very fast, and ripen early.

The harvest is commonly over at this place before the beginning of September; and should it fall out otherwise, the whole crop would be almost destroyed by the equinoctial storms. All the islanders on the western coast have great reason to dread the fury of autumnal tempests: these, together with the excessive quantities of rain they have, generally, throughout seven or eight months of the year, are undoubtedly the most disadvantageous and unhappy circumstances of their lives.

Barley and oats are the only sorts of grain known at St Kilda; nor does it seem calculated for any other. Fifty bolls of the former, old highland measure, are every year brought from thence to Harris; and all the western islands hardly produce any thing so good of the kind. Potatoes have been introduced among that people only of late, and hitherto they have raised but small quantities of them. The only appearance of a garden in this whole land, so the natives call their principal island in their own language, is no more than a very inconsiderable piece of ground, which is inclosed, and planted with some cabbages. On the east side of the island, at the distance of a quarter of a mile from the bay, lies the village, where the whole body of this little people (the number amounting in 1764 to no more than 88) live together like the inhabitants of a town or city. It is certain that the inhabitants were much more numerous formerly than at present; and the island, if under proper regulations, might easily support 300 souls. Martin, who visited it about the end of the last century, found 180 persons there; but about the year 1730, one of the people coming to the island of Harris, was seized with the small-pox and died. Unluckily his clothes were carried away by one of his relations next year; and thus was the infection communicated, which made such havoc, that only four grown persons were left alive. Their houses are built in two rows, regular, and facing one another; with a tolerable caufeway in the middle, which they call the *street*. These habitations are made and contrived in a very uncommon manner. Every one of them is flat in the roof, or nearly so, much like the houses of some oriental nations. That from any one of these the St Kildians have borrowed their manner of building, no man of sense will entertain a suspicion. They have been taught this lesson by their own reason, improved by experience. The place in which their lot has fallen, is peculiarly subject to violent squalls and furious hurricanes: were their houses raised higher than at present, they believe the first winter-storm

would bring them down about their ears. For this reason, the precaution they take in giving them roofs much flatter than ordinary, seems to be not altogether unnecessary. The walls of these habitations are made of a rough gritty kind of stones, huddled up together in haste, without either lime or mortar, from eight to nine feet high. In the heart of the walls are the beds, which are overlaid with flags, and large enough to contain three persons. In the side of every bed is an opening, by way of door, which is much too narrow and low to answer that purpose. All their dwelling-houses are divided into two apartments by partition-walls. In the division next the door, which is much the largest, they have their cattle stalled during the whole winter-season; the other serves for kitchen, hall, and bed-room.

It will be readily expected, that a race of men and women, bred in St Kilda, must be a very slovenly generation, and every way inelegant. It is indeed impossible to defend them from this imputation. Their method of preparing a sort of manure, to them indeed of vast use, proves that they are very indelicate. After having burnt a considerable quantity of dried turf, they spread the ashes with the nicest care over the floor of that apartment in which they eat and sleep. These ashes, so exactly laid out, they cover with a rich friable sort of earth; over this bed of earth they scatter a proportionable heap of that dust into which peats are apt to crumble away: this done, they water, tread, and beat the whole compost into a hard floor, on which they immediately make new fires very large, and never extinguished till they have a sufficient stock of new ashes on hand. The same operations are repeated with a never-failing punctuality, till they are just ready to sow their barley; by that time the walls of their houses are sunk down, or, to speak more properly, the floors risen, about four or five feet.

To have room enough for accumulating heaps of this compost one above another, the ancient St Kildians had ingenuity enough to contrive their beds within the linings of their walls; and it was for the same reason they took care to raise these walls to an height far from being common in the other western islands. The manure produced in this way must undoubtedly be good, though probably rather sharp than of long duration, as it is scattered in small quantities upon the surface of the ground. Be that as it will, those who practise this art are abundantly lavish in its praises. They call it a *commodity inestimably precious*; and one may venture to affirm, that a genuine St Kildian would scruple to barter it away for all the diamonds in Brazil and Golconda.

It is certain that cleanliness must contribute greatly to health, and of course longevity; but in spite of that instance of indelicacy now given, and many more which might have been added, the people of this island are not more short-lived than other men. Their total want of those articles of luxury, which have so natural a tendency to destroy the constitution of the human body, and their moderate exercises, will, together with some other circumstances, keep the balance of life equal enough between them and those who are absolute strangers to slovenliness.

Beside the dwelling-houses already described, there are a prodigious number of little cells, dispersed over

all the island; which consist entirely of stones, without any the smallest help of timber. These cells are from twelve to eighteen feet in length, and a little more than seven in height. Their breadth at the foundation is nearly equal to the height. Every stone hangs above that immediately below, not perpendicularly, but inclines forward, so as to be nearer the opposite side of the grotto, and thus by imperceptible degrees till the two highest courses are near enough to be covered by a single flag at the top. To hinder the rain from falling down between the interstices above, the upper part of the building is overlaid with turf, which looks like a fine greenward while new. The inhabitants secure their peats, eggs, and wild-fowl, within these small repositories: every St Kildian has his share of them, in proportion to the extent of land he possesses, or the rent he pays to the steward. From the construction of these cells, and the toil they must have cost before they could have been finished, it seems plain, that those who put them together, were, if not more ingenious than their neighbours in the adjacent islands, at least more industrious than their own successors.

The St Kilda method of catching wild-fowl is very entertaining. The men are divided into fowling-parties, each of which consists generally of four persons distinguished by their agility and skill. Each party must have at least one rope about thirty fathoms long; this rope is made out of a strong raw cow-hide, salted for that very purpose, and cut circularly into three thongs, all of equal length; these thongs being closely twisted together, form a three-fold cord, able to sustain a great weight, and durable enough to last for about two generations: to prevent the injuries it would otherwise receive from the sharp edges of the rocks, against which they must frequently strike, the cord is lined with sheep-skins, dressed in much the same manner.

This rope is a piece of furniture indispensably necessary, and the most valuable implement a man of substance can be possessed of in St Kilda. In the testament of a father, it makes the very first article in favour of his eldest son: should it happen to fall to a daughter's share, in default of male heirs, it is reckoned equal in value to the two best cows in the island.

By the help of such ropes, the people of the greatest prowess and experience here traverse and examine rocks prodigiously high. Linked together in couples, each having either end of the cord fastened about his waist, they go frequently through the most dreadful precipices: when one of the two descends, his colleague plants himself on a strong shelf, and takes care to have such sure footing there, that if his fellow-adventurer makes a false step, and tumbles over, he may be able to save him.

The following anecdote of the present steward of St Kilda's deputy, will give the reader a specimen of the dangers they undergo, and, at the same time, of the uncommon strength of the St Kildians. This man, observing his colleague lose his hold, and tumbling down from above, placed himself so firmly upon the shelf where he stood, that he sustained the weight of his friend, after falling the whole length of the rope. Undoubtedly these are stupendous adventures, and equal to any thing in the feats of chivalry. Mr Macaulay

Kildare  
Kilkenny.

aulay gives an instance of the dexterity of the inhabitants of St Kilda in catching wild-fowl, to which he was an eye-witness. Two noted heroes were drawn out from among all the ablest men of the community: one of them fixed himself on a craggy shelf; his companion went down sixty fathoms below him; and after having darted himself away from the face of a most alarming precipice, having over the ocean, he began to play his gambols; he sung merrily, and laughed very heartily: after having performed several antic tricks, and given all the entertainment his art could afford, he returned in triumph, and full of his own merit, with a large string of fowls about his neck, and a number of eggs in his bosom. This method of fowling resembles that of the Norwegians, as described by bishop Pontoppidan.

**KILDARE**, a town of Ireland, and capital of a county of the same name, with a bishop's see, and the title of an earldom. W. Long. 7. o. N. Lat. 53. 10.

**KILDARE**, a county of Ireland, in the province of Leinster, which is 37 miles in length, and 24 in breadth; and is bounded on the east by Dublin and Wicklow, on the west by King and Queen's county, on the north by East-Meath, and on the south by Catherlogh. It is a rich plentiful country, and the capital town is of the same name. It contains near 9000 houses, 100 parishes, 10 baronies, and four boroughs. It sends 20 members to parliament.

**KILDERKIN**, a liquid measure, containing two firkins.

**KILIANUS** (Cornelius), a native of Brabant, distinguished himself as an excellent corrector of the press at the printing-house of Plantin for 50 years. He likewise wrote several books which are esteemed. His apology for correctors against authors, an epigram of 18 verses, is a proof of his abilities in Latin poetry.

**KILKENNY**, a county of Ireland, in the province of Leinster, bounded on the south by the county of Waterford, on the north by the Queen's county; on the west by the county of Tipperary, on the east by the counties of Wexford and Catherlogh, and on the north-west by Upper Ossory. The greatest length of this country from north to south is 40 miles, the breadth from east to west 20; and it contains 10 baronies. It is one of the most healthful, pleasant, and populous counties of Ireland. The members sent by it to parliament are 16, *viz.* two for the county, two for Kilkenny, and two a-piece for Irish-town, or St Kennis, Gowran, Thomastown, Callan, Innistock, and Knocktopher. This county is divided, as it were, into two parts, by the river Neor or Nura, which has its source in those lofty mountains called the *Slievebloom* or *Blandinehills*.

**KILKENNY**, the capital of a county of the same name in Ireland, situated in W. Long. 7. 15. N. Lat. 52. 30. takes its name from the cell or church of Canic, who was an eminent hermit in this country. It is the seat of the bishop of Ossory, which was translated from Agabo, in Ossory, about the end of Henry II's reign, by bishop O'Duillany. The city is divided into the English and Irish towns. The English town is much the newer and most considerable; the other, (which is also called *St Kenny's* or *Canic's*, from the cathedral dedicated to that saint, which stands upon an eminence (where there is a most delightful prospect), being only

Kilkenny.

a kind of suburbs. Both together make one of the largest, most wealthy, populous, and trading towns in the kingdom. Here are barracks for a troop of horse and four companies of foot; and a well endowed free-school, called the *college*. The supreme council of the rebels under the pope's nuncio sat at Kilkenny during the time of the general massacre. The city is pleasantly situated on the Neor, a navigable river that discharges itself into the harbour of Waterford. It is said of Kilkenny, that its air is without fog, its water without mud, its fire without smoke, and its streets paved with marble. The two latter are, indeed, matter of fact; for they have, in the neighbourhood, a kind of coal, that burns from first to last without smoke, and pretty much resembles the Welsh coal. Most of the streets also are actually paved with a very good sort of black marble, of which they have large quarries near the town, which takes a fine polish, and is beautifully intermixed with white granite. The air too is good and healthy, though not remarkably clearer than in many other parts of the kingdom. Here is the ancient seat of the Ormond family, which is an ornament to the city; and the neighbouring country is well cultivated and very fertile.

About two miles from this city, in the neighbourhood of the park-house of Donmore, formerly occupied by the duke of Ormond, are a number of caves as curious, perhaps, as any mentioned in history, except those of *Antiparos* in the Archipelago: we shall present the reader with a description of them taken on the spot, by an ingenious gentleman of Dublin. "After a difficult descent of about 100 feet, the entrance into this subterranean world is gained. The appearance of the first cavern is uncommonly awful; and gives rise to an idea of a Gothic structure, grand in ruin. The solemnity of this place is not a little increased by the gaiety of those scenes that present themselves on every side previous to our entering it. The floor is uneven, and stones of various sizes are promiscuously dispersed upon it. The sides are composed of ragged work; in some parts covered with moss, and in others curiously frosted; and from the roof, which is a kind of arch, several huge rocks project beyond each other, that seem to threaten instant ruin. The circumference of this cave is not less than 200 feet, and its height about 50. Here is a small but continual dropping of water from the ceiling, and a few petrifications resembling icicles. This place has its inhabitants; for immediately on entering into it, you are surprised with a confused noise, which is occasioned by a multitude of wild pigeons. Hence there is a passage towards the left, where, by a small ascent, a kind of hole is gained, like to, but larger than, the mouth of an oven, which introduces to a place, where, by the help of candles, day-light being entirely excluded, a broken and surprising scene of monstrous stones, heaped on each other, chequered with various colours, inequality of rocks overhead, and an infinity of fantastical stones, presents itself. It would be matter of much difficulty, or rather impracticable, to walk over this apartment, had not nature, as if studious for the safety of the curious, caused sorts of branches to shoot from the surface of the rocks, which are remarkably smooth, very unequal, and always damp. These branches are from four to six inches in length, and nearly as thick. They are useful

Kilkenny,  
Killcrankie

useful in the summits of the rocks to prevent slipping; and in the sides are ladders, whereby to descend and ascend with tolerable facility. This astonishing amfractuous passage leads to a place far more curious than any of the rest. On entering into it, one is almost induced to believe himself situated in an ancient temple, decorated with all the expence of art; yet, notwithstanding the beauty and splendor that catches the eye on every side, there is something of solemnity in the fashion of the place, which must be felt by the most ordinary spectator. The floor in some parts is covered with a crystalline substance; the sides in many places are incruited with the same, wrought in a mode not unlike the Gothic style of ornament; and the top is almost entirely covered with inverted pyramids of the like elegantly white and lucid matter. At the points of these stalactical streets are perpetually hanging drops of pellucid water; for when one falls, another succeeds. These pendent gems contribute not a little to the glory of the roof, which, when the place is properly illuminated, appears as if formed of the purest crystal. Here are three extraordinary and beautiful congelations, which, without the aid of a strong imagination, may be taken for an organ, altar, and cross. The former, except when strictly examined, appears to be a regular work of art, and is of a considerable size; the second is of a simple form, rather long than square; and the third reaches from the floor to the roof, which must be about 20 feet. These curious figures are owing to water that falls from the upper parts of the cave to the ground, which coagulated into stone from time to time, until at length it acquired those forms which are now so pleasing; or to an exhalation or exsufflation of petrifying juices out of the earth; or perhaps they partake of the nature of spar, which is a kind of rock-plant. The former seems to be the most probable supposition; as these figures, in colour and consistence, appear exactly like the icicles on the top, which are only seen from the wet parts of the caverns; and in this place there is a greater oozing of water, and a much larger number of petrifications, than in any other. When this curious apartment has been sufficiently examined, the guides lead you for a considerable way through winding passages, until a glimmering light agreeably surprises. Here the journey of above a quarter of a mile, through those parts, is ended: but, upon returning into the first cavern, the entrance into other apartments, less curious indeed, but as extensive as those we have described, offers itself. The passages into some of those are so very low, that there is a necessity of creeping through them: by these we proceed until the noise of a subterranean river is heard, but farther none have ventured.

**KILLICRANKIE**, a noted pass of Argyleshire, in the Highlands of Scotland. It is formed by the lofty mountains impending over the water of Garrie, which rushes through in a deep, darksome, and horrid channel beneath. In the last century this was a pass of much danger and difficulty; a path hanging over a tremendous precipice threatened destruction to the least false step of the traveller: at present a fine road formed by the soldiery lent by government, and encouraged by an additional 6d. per day, gives an easy access to the remote Highlands; and the two sides are joined by a fine arch.

Near the north end of this pass in its open end unimproved state was fought, in the year 1689, the battle of Killcrankie, between the adherents of James II. under Viscount Dundee, and of William III. under general Mackay. Dundee's army was very much inferior to that of Mackay's. When he came in sight of the latter, he found them formed in eight battalions, ready for action. They consisted of 4500 foot, and two troops of horse. The Highlanders, under Dundee, amounted to little more than half that number. These he ranged instantly in order of battle. Maclean, with his tribe, formed the right wing. The Macdonalds of Sky, under their chieftain's eldest son, formed the left. The Camerons, the Macdonalds of Glengary, the followers of Clanronald, and a few Irish auxiliaries, were in the centre. A troop of horse were placed behind, under Sir William Wallace. The officers sent by James from Ireland were distributed through all the line. His whole army stood in sight of the enemy for several hours on the steep side of a hill, which faced the narrow plain where Mackay had formed his line. Dundee wished for the approach of night; a season suited for either victory or flight.

At five of the clock in the afternoon, a kind of slight skirmish began between the right wing of the Highlanders and the left of the enemy. But neither army wishing to change their ground, the firing was discontinued for three hours. Dundee, in the mean time, flew from tribe to tribe, and animated them to action. At eight of the clock he gave the signal for battle; and charged the enemy in person, at the head of the horse. The Highlanders, in deep columns, rushed suddenly down the hill. They kept their shot till they were within a pike's length of the enemy; and, having fixed their muskets, fell upon them sword in hand. Mackay's left wing could not for a moment sustain the shock. They were driven by the Macleans with great slaughter from the field. The Macdonalds, on the left of the Highlanders, were not equally successful. Colonel Hafling's regiment of foot stood their ground. They even forced the Macdonalds to retreat. Maclean, with a few of his tribe, and Sir Evan Cameron at the head of his clan, fell suddenly on the flank of this gallant regiment, and forced them to give way. The slaughter ended not with the battle. Two thousand fell in the field and the flight. The tents, baggage, artillery, and provisions of the enemy, and even king William's Dutch standard, which was carried by Mackay's regiment, fell into the hands of the Highlanders. The victory was now complete. But the Highlanders lost their gallant leader. Perceiving the unexpected resistance of Colonel Hafling's regiment, and the confusion of the Macdonalds, Dundee rode rapidly to the left wing. As he was raising his arm, and pointing to the Camerons to advance, he received a ball in his side. The wound proved mortal, and with Dundee fell all the hopes of king James at that time.

**KILLIGREW** (William), eldest son of Sir Robert Killigrew knight, was born in 1605. He was gentleman-usher of the privy-chamber to king Char. I. and, on the restoration, to Charles II. When the latter married the princess Catharine of Portugal, he was created vice-chamberlain; in which station he continued 22 years, and died in 1693. He was the author of four plays, which, though now thrown aside, were much

Killcrankie  
Killigrew

much applauded by the poets of that time, particularly by Mr Waller; and in the decline of life he published some pious reflections on the instability of human happiness, when our views are not directed to a future fate.

KILLIGREW (Thomas), brother of the former, was born in 1611; and, in process of time, distinguished himself by his uncommon natural parts. He was page of honour to king Charles I. and groom of the bed-chamber to Charles II. with whom he suffered many years exile; during which he applied his leisure hours to the study of poetry, and to the composition of several plays. After the restoration, he continued in high favour with the king, and had frequently access to him when he was denied to the first peers in the realm; and being a man of great wit and liveliness of parts, and having from his long intimacy with that monarch, and being continually about his person during his troubles, acquired a freedom and familiarity with him, which even the pomp of majesty afterwards could not check in him, he sometimes, by way of jest, which king Charles was ever fond of, if genuine, even though himself was the object of the satire, would adventure bold truths which scarcely any one besides would have dared even to hint at. One story in particular is related of him, which, if true, is a strong proof of the great lengths he would sometimes proceed in his freedoms of this kind, which is as follows:—When the king's unbounded passion for women had given his mistress such an ascendancy over him, that, like the effeminate Persian monarch, he was much fitter to have handled a distaff than to wield a sceptre, and for the conversation of his concubines utterly neglected the most important affairs of state, Mr Killigrew went to pay his Majesty a visit in his private apartments, habited like a pilgrim who was bent on a long journey. The king, surprised at the oddity of his appearance, immediately asked him what was the meaning of it, and whither he was going? "To hell," bluntly replied the wag. "Præter, (said the king), what can your errand be to that place?" "To fetch back Oliver Cromwell, (rejoined he), that he may take some care of the affairs of England, for his successor takes none at all." Our more story is related of him, which is not barren of humour. King Charles's fondness for pleasure, to which he almost always made business give way, used frequently to delay affairs of consequence from his majesty's disappointment the council of his presence when met for the dispatch of business, which neglect gave great disgust and offence to many of those who were treated with this seeming disrespect. On one of these occasions the duke of Lauderdale, who was naturally impetuous and turbulent, quitted the council chamber in a violent passion; and, meeting Mr Killigrew presently after, expressed himself on the occasion in very disrespectful terms of his majesty. Killigrew begged his grace to moderate his passion, and offered to lay him a wager of 100l. that he himself would prevail on his majesty to come to council in half an hour. The duke, surprized at the boldness of the assertion, and warmed by his resentment against the king, accepted the wager; on which Killigrew immediately went to the king, and, without ceremony, told him what had happened; adding these words, "I know that your

majesty hates Lauderdale, though the necessity of your affairs compels you to carry an outward appearance of civility: now, if you choose to get rid of a man who is thus disagreeable to you, you need only go this once to council; for I know his covetous disposition so perfectly, that I am well persuaded, rather than pay this hundred pounds, he would hang himself out of the way, and never plague you more." The king was so pleased with the archness of this observation, that he immediately replied, "Well then, Killigrew, I positively will go;" and kept his word accordingly.—Killigrew died in 1682, and was buried in Westminster-abbey.

KILLIGREW (Anne), "a Grace for beauty, and a Muse for wit," as Mr Wood says, was the daughter of Dr Henry Killigrew, brother of the two foregoing, and was born a little before the restoration. She gave early indications of genius, and became eminent in the arts both of poetry and painting. She drew the duke of York, and his duchess to whom she was paid of honour, as well as several other portraits and history-pieces; and crowned all her other accomplishments with unblemished virtue and exemplary piety. Mr Dryden seems quite lavish in her praise, though Wood assures us he has said no more of her than she was equal if not superior to. This amiable young woman died of the small-pox in 1685, and the year after her poems were published in a thin 4to volume.

KILMARNOCK, a populous and flourishing town of Ayrshire in Scotland, famous for its manufacture of broad cloth and hardware. It gave the title of earl to the noble family of Boyd, residing in this neighbourhood. This title was forfeited by the late earl, who, by engaging in the rebellion of 1745, was deprived of his honours, and lost his life on the scaffold. His son, however, who served in the king's army, afterwards succeeded to the earldom of Errol, a title much more ancient and honourable.

KIMBOLTON, a town of Huntingdonshire, seated in a bottom; and noted for the castle of Kimbolton, the seat of the duke of Manchester. W. Long. o. 15. N. Lat. 52. 18.

KIMCHI (David), a Jewish rabbi, famous as a commentator on the Old Testament, lived at the close of the 12th and beginning of the 13th centuries. He was a Spaniard by birth, son of rabbi Joseph Kimchi, and brother of rabbi Moses Kimchi, both men of eminent learning among the Jews: but he exceeded them both, being the best Hebrew grammarian the Jews ever had. He wrote a Grammar and Dictionary of that language; out of the former of which Buxtorf made his *Thesaurus linguae Hebraeae*, and his *Lexicon linguae Hebraeae* out of the latter. His writings have been held in such estimation among the Jews, that no one can arrive at any reputation in letters and theology without studying them.

KINDRED, in law, persons related to one another, whereof the law reckons three degrees or lines, viz. the descending, ascending, and collateral line. See CONSANGUINITY and DESCENT.

On there being no kindred in the descending line, the inheritance passes in the collateral one.

KING, in the general acceptation of the word, is a person who has a supreme authority, with the power of levying taxes, making laws, and enforcing an obedience

King.

dience to them: but in Britain, which is a limited monarchy, the power of the king is greatly restrained; which is so far from diminishing his honour, that it adds a glory to his crown; for while other kings are absolute monarchs over innumerable multitudes of slaves, the king of Britain has the distinguished glory of governing a free people, the least of whom is protected by the laws: he has great prerogatives, and a boundless power in doing good; and is at the same time only restrained from acting inconsistently with his own happiness, and that of his people.

To understand the royal rights and authority, we must consider the king under six distinct views. 1. With regard to his title. 2. His royal family. 3. His councils. 4. His duties. 5. His prerogative. 6. His revenue.

I. His title. For this, see *HEREDITARY Right*, and *SUCCESSION*.

II. His royal family. See *ROYAL Family*.

III. His councils. See *COUNCIL*.

IV. His duties. By our constitution, there are certain duties incumbent on the king; in consideration of which, his dignity and prerogative are established by the laws of the land: it being a maxim in the law, that protection and subjection are reciprocal. And these reciprocal duties are what Sir William Blackstone apprehends were meant by the convention in 1688, when they declared that king James had broken the original contract between king and people. But however, as the terms of that original contract were in some measure disputed, being alleged to exist principally in theory, and to be only deducible by reason and the rules of natural law, in which deduction different understandings might very considerably differ; it was, after the revolution, judged proper to declare these duties expressly, and to reduce that contract to a plain certainty. So that, whatever doubts might be formerly raised by weak and scrupulous minds about the existence of such an original contract, they must now entirely cease; especially with regard to every prince who hath reigned since the year 1688.

The principal duty of the king is, To govern his people according to law. *Nec regibus infinita aut libera potestas*, was the constitution of our German ancestors on the continent. And this is not only consonant to the principles of nature, of liberty, of reason, and of society; but has always been esteemed an express part of the common law of England, even when prerogative was at the height. "The king," saith Bracton, who wrote under Henry III. "ought not to be subject to man; but to God, and to the law; for the law maketh the king. Let the king therefore render to the law, what the law has invested in him with regard to others; dominion, and power: for he is not truly king, where will and pleasure rules, and not the law." And again: "The king hath a superior, namely God; and also the law, by which he was made a king." Thus Bracton; and Fortescue also, having first well distinguished between a monarchy absolutely and despotically regal, which is introduced by conquest and violence, and a political or civil monarchy, which arises from mutual consent, (of which last species he asserts the government of England to be), immediately lays it down as a principle, that "the king of England must rule his people ac-

King.

cording to the decrees of the laws thereof; inasmuch that he is bound by an oath at his coronation to the observance and keeping of his own laws." But to obviate all doubts and difficulties concerning this matter, it is expressly declared by statute 12 & 13 W. III. c. 2. "that the laws of England are the birthright of the people thereof; and all the kings and queens who shall ascend the throne of this realm ought to administer the government of the same according to the said laws, and all their officers and ministers ought to serve them respectively according to the same: and therefore all the other laws and statutes of this realm, for securing the established religion, and the rights and liberties of the people thereof, and all other laws and statutes of the same now in force, are by his majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, and by authority of the same, ratified and confirmed accordingly."

And, as to the terms of the original contract between king and people, these, it is apprehended, are now couched in the coronation-oath, which by the statute 1 W. & M. II. c. 6. is to be administered to every king and queen who shall succeed to the imperial crown of these realms, by one of the archbishops or bishops of the realm, in the presence of all the people; who on their parts do reciprocally take the oath of allegiance to the crown. This coronation-oath is conceived in the following terms.

"The archbishop or bishop shall say, Will you solemnly promise and swear to govern the people of this kingdom of Britain, and the dominions thereto belonging, according to the statutes in parliament agreed, and the laws and customs of the same?—The king or queen shall say, I solemnly promise so to do.

"Archbishop or bishop. Will you to your power cause law and justice, in mercy, to be executed in all your judgments?—King or queen. I will.

"Archbishop or bishop. Will you to the utmost of your power maintain the laws of God, the true profession of the gospel, and the Protestant reformed religion established by the law? And will you preserve unto the bishops and clergy of this realm, and to the churches committed to their charge, all such rights and privileges as by law do or shall appertain unto them, or any of them?—King or queen. All this I promise to do.

"After this the king or queen, laying his or her hand upon the holy gospel, shall say, The things which I have here before promised, I will perform and keep: so help me God. And then shall kiss the book."

This is the form of the coronation-oath, as it is now prescribed by our laws; the principal articles of which appear to be at least as ancient as the mirror of justices, and even as the time of Bracton; but the wording of it was changed at the revolution, because (as the statute alleges) the oath itself had been framed in doubtful words and expressions, with relation to ancient laws and constitutions at this time unknown. However, in what form soever it be conceived, this is most indisputably a fundamental and original express contract; though, doubtless, the duty of protection is impliedly as much incumbent on the sovereign before coronation as after: in the same manner as alle-

giance,

King. giance to the king becomes the duty of the subject immediately on the descent of the crown, before he has taken the oath of allegiance, or whether he ever takes it at all. This reciprocal duty of the subject will be considered in its proper place. At present we are only to observe, that in the king's part of this original contract are exprest all the duties which a monarch can owe to his people, viz. to govern according to law; to execute judgment in mercy; and to maintain the established religion. And, with respect to the latter of these three branches, we may farther remark, that by the act of union, 5 Ann. c. 8. two preceding statutes are recited and confirmed; the one of the parliament of Scotland, the other of the parliament of England: which enact; the former, that every king at his accession shall take and subscribe an oath, to preserve the Protestant religion, and presbyterian church-government in Scotland; the latter, that at his coronation he shall take and subscribe a similar oath, to preserve the settlement of the church of England, within England, Ireland, Wales, and Berwick, and the territories thereunto belonging.

V. His prerogative. See PREROGATIVE.

VI. His revenue. See REVENUE.

Having in the preceding articles chalked out all the principal outlines of this vast title of the law, the supreme executive magistrate, or the king's majesty, considered in his several capacities and points of view; it may not be improper to take a short comparative review of the power of the executive magistrate, or prerogative of the crown, as it stood in former days, and as it stands at present. And we cannot but observe, that most of the laws for ascertaining, limiting, and restraining this prerogative have been made within the compass of little more than a century past; from the petition of right in 3 Car. I. to the present time. So that the powers of the crown are now to all appearance greatly curtailed and diminished since the reign of king James I. particularly by the abolition of the star-chamber and high-commission courts in the reign of Charles I. and by the disclaiming of martial law, and the power of levying taxes on the subject, by the same prince; by the disuse of forest-laws for a century past; and by the many excellent provisions enacted under Charles II.; especially the abolition of military tenures, purveyance, and pre-emption; the *habeas corpus* act; and the act to prevent the discontinuance of parliaments for above three years: and, since the revolution, by the strong and emphatical words in which our liberties are asserted in the bill of rights, and act of settlement; by the act for triennial, since turned into septennial, elections; by the exclusion of certain officers from the house of commons; by rendering the seats of the judges permanent, and their salaries independent; and by restraining the king's pardon from obstruſing parliamentary impeachments. Besides all this, if we consider how the crown is impoverished and stripped of all its ancient revenues, so that it greatly depends on the liberality of parliament for its necessary support and maintenance, we may perhaps be led to think, that the balance is inclined pretty strongly to the popular scale, and that the executive magistrate has neither independence nor power enough left, to form that check upon the lords and commons which the founders of our constitution intended.

VOL. VI.

But, on the other hand, it is to be considered, that every prince, in the first parliament after his accession, has by long usage a truly royal addition to his hereditary revenue settled upon him for his life; and has never any occasion to apply to parliament for supplies, but upon some public necessity of the whole realm. This restores to him that constitutional independence, which at his first accession seems, it must be owned, to be wanting. And then, with regard to power, we may find perhaps that the hands of government are at least sufficiently strengthened; and that a British monarch is now in no danger of being overborne by either the nobility or the people. The instruments of power are not perhaps so open and avowed as they formerly were, and therefore are the less liable to jealous and invidious reflections; but they are not the weaker upon that account. In short, our national debt and taxes (besides the inconveniencies beforementioned), have also in their natural consequences thrown such a weight of power into the executive scale of government, as we cannot think was intended by our patriot ancestors; who gloriously struggled for the abolition of the then formidable parts of the prerogative, and by an unaccountable want of foresight established this system in their stead. The entire collection and management of so vast a revenue, being placed in the hands of the crown, have given rise to such a number of new officers, created by and removable at the royal pleasure, that they have extended the influence of government to every corner of the nation. Witness the commissioners, and the multitude of dependents on the customs, in every port of the kingdom; the commissioners of excise, and their numerous subalterns, in every inland district; the post-masters, and their servants, planted in every town, and upon every public road; the commissioners of the stamps, and their distributors, which are full as scattered and full as numerous; the officers of the salt-duty, which, tho' a species of excise, and conducted the same manner, are yet made a distinct corps from the ordinary managers of that revenue; the surveyors of houses and windows; the receivers of the land-tax; the managers of lotteries; and the commissioners of hackney-coaches: all which are either mediately or immediately appointed by the crown, and removeable at pleasure without any reason assigned: these, it requires but little penetration to see, must give that power, on which they depend for subsistence, an influence most amazingly extensive. To this may be added the frequent opportunities of conferring particular obligations, by preference in loans, subscriptions, tickets, remittances, and other money-transactions, which will greatly increase this influence; and that over those persons whose attachment, on account of their wealth, is frequently the most desirable. All this is the natural, though perhaps the unforeseen, consequence of erecting our funds of credit, and, to support them, establishing our perpetual taxes: the whole of which is entirely new since the restoration in 1660; and by far the greatest part since the revolution in 1688. And the same may be said with regard to the officers in our numerous army, and the places which the army has created. All which put together give the executive power so persuasive an energy with respect to the persons themselves, and so prevailing an interest with their friends and families, as will amply

King.

make amends for the loss of external prerogative.

But, though this profusion of offices should have no effect on individuals, there is still another newly acquired branch of power; and that is, not the influence only, but the force, of a disciplined army: paid indeed ultimately by the people, but immediately by the crown: raised by the crown, officered by the crown, commanded by the crown. They are kept on foot, it is true, only from year to year, and that by the power of parliament: but during that year, they must by the nature of our constitution, if raised at all, be at the absolute disposal of the crown. And there need but few words to demonstrate how great a trust is thereby reposed in the prince by his people: A trust, that is more than equivalent to a thousand little troublesome prerogatives.

Add to all this, that, besides the civil list, the immense revenue of almost seven millions sterling, which is annually paid to the creditors of the public, or carried to the sinking fund, is first deposited in the royal exchequer, and thence issued out to the respective offices of payment. This revenue the people can never refuse to raise, because it is made perpetual by act of parliament: which also, when well considered, will appear to be a trust of great delicacy and high importance.

Upon the whole, therefore, it seems clear, that, whatever may have become of the *nominal*, the real power of the crown has not been too far weakened by any transactions in the last century. Much is indeed given up; but much is also acquired. The stern commands of prerogative have yielded to the milder voice of influence: the slavish and exploded doctrine of non-resistance has given way to a military establishment by law; and to the disuse of parliaments has succeeded a parliamentary trust of an immense perpetual revenue. When, indeed, by the free operation of the sinking fund, our national debts shall be lessened; when the posture of foreign affairs, and the universal introduction of a well-planned and national militia, will suffer our formidable army to be thinned and regulated; and when (in consequence of all) our taxes shall be gradually reduced; this adventitious power of the crown will slowly and imperceptibly diminish, as it slowly and imperceptibly rose. But, till that shall happen, it will be our especial duty, as good subjects and good Englishmen, to reverence the crown, and yet guard against corrupt and servile influences from those who are intrusted with its authority; to be loyal, yet free; obedient, and yet independent; and above every thing, to hope that we may long, very long, continue to be governed by a sovereign, who, in all those public acts that have personally proceeded from himself, hath manifested the highest veneration for the free constitution of Britain; hath already in more than one instance remarkably strengthened its outworks; and will therefore never harbour a thought, or adopt a persuasion, in any the remotest degree detrimental to public liberty.

KING (Dr John), a learned English bishop in the 17th century, bred at Westminster-school, and afterward at Christ-church Oxford. He was appointed chaplain to queen Elizabeth. In 1605, he was made dean of Christ-church, and was for several years vice-chancellor of Oxford. In 1611, he was advanced to the bishopric of London. Besides his *Lectures upon*

*Jonah*, delivered at York, he published several sermons. King James I. used to style him *the king of preachers*; and lord chief justice Coke often declared, that *he was the best speaker in the star-chamber in his time*. He was so constant in preaching after he was a bishop, that, unless he was hindered by want of health, he omitted no Sunday whereon he did not visit some pulpit in London or near it. Soon after his death, the Papists reported, that he died a member of their church. But the falsity of this story was sufficiently exposed by his son Mr Henry King, in a sermon at St Paul's cross soon after; by bishop Godwin in the *Appendix to his Commentarius de presulibus Angliæ*, printed in 1622; and by Mr John Gee, in his book intitled, *The foot out of the snare*.

KING (Dr Henry), bishop of Chichester, eldest son of the former, was born in 1591, and educated at Oxford. He became an eminent preacher, and chaplain to king James I. and Charles I. In 1638, he was made dean of Rochester; and, in 1641, was advanced to the see of Chichester. Upon the breaking out of the civil wars, and the dissolution of episcopacy, he was treated with great severity by the friends to the parliament; but recovered his bishopric at the restoration. This worthy prelate, who had a most amiable character, died in 1699; and was interred at his cathedral of Chichester, where a monument was erected to his memory. He published, 1. *The psalms of David turned into metre*. 2. *Poems, elegies, paradoxes, and sonnets*. 3. *Several sermons, and other works*.

KING (Dr William), a facetious English writer in the beginning of the 18th century, was well descended, being allied to the noble families of Clarendon and Rochester. He was elected a student of Christ-church from Westminster-school in 1681, aged 18. He afterward entered upon the law line, and took the degree of doctor of civil law. He soon acquired a considerable reputation as a civilian, and was in great practice. He attended the earl of Pembroke, lord lieutenant of Ireland, into that kingdom, where he was appointed judge-advocate, sole commissioner of the prizes, keeper of the records, vicar-general to the lord primate of Ireland; was countenanced by persons of the highest rank, and might have made a fortune. But so far was he from heaping up riches, that he returned to England with no other treasure than a few merry poems and humorous essays, and retired to his students place at Christ-church. He died on Christmas-day in 1712, and was interred in the cloisters of Westminster-abbey. His writings are pretty numerous. The principal are, *Animadversions on a pretended account of Denmark*, wrote by Mr Moleworth, afterwards lord Moleworth. The writing of these procured Dr King the place of secretary to princeess Anne of Denmark. 2. *Dialogues of the dead*. 3. *The art of love*, in imitation of Ovid *De arte amandi*. 4. *A volume of poems*. 5. *Useful transactions*. 6. *An historical account of the heathen gods and heroes*. 7. *Several translations*.—As to the character of Dr King, he naturally hated business, especially that of an advocate; but made an excellent judge when appointed one of the court of delegates. His chief pleasure consisted in trifles; and he was never happier than when he thought he was hid from the world. Yet he loved company, provided they

King. they were such as tallied with his humour. He would say a great many ill-natured things, but never do one. He was made up of tenderness and pity, and tears would fall from him on the smallest occasion: His education had been strict, and he was naturally of a religious disposition.

KING (Dr William), archbishop of Dublin in the 18th century, was descended from an ancient family in the north of Scotland, but born in the county of Antrim in the north of Ireland. In 1674, he went into priests orders. In 1679, he was promoted by his patron, Dr Parker, archbishop of Dublin, to the chancellorship of St Patrick. In 1687, Peter Manby, dean of Londonderry, having published at London in 4to, a pamphlet intitled *Considerations which obliged Peter Manby dean of Londonderry to embrace the Catholic religion*, our author immediately wrote an answer. Mr Manby, encouraged by the court, and assisted by the most learned champions of the church of Rome, published a reply under this title, *A reformed catechism, in two dialogues concerning the English reformation, &c. in reply to Mr King's answer, &c.* Our author soon rejoined in *A vindication of the answer*. Mr Manby dropped the controversy, but dispersed a loose sheet of paper, artfully written, with this title, *A letter to a friend, shewing the vanity of this opinion, that every men's sense and reason are to guide him in matters of faith*. This Dr King refuted in "A vindication of the Christian religion and reformation, against the attempts of a letter, &c." In 1689, he was twice confined in the tower by order of king James II. and the same year commenced doctor of divinity. In 1690, upon king's James's retreat to France after the battle at the Boyne, he was advanced to the see of Derry. In 1692, he published at London in 4to, *The state of the protestants of Ireland under the late king James's government, &c.* "A history, (says bishop Burnet,) as truly as it is finely written." He had by him at his death attested vouchers of every particular fact alleged in this book, which are now in the hands of his relations. However, it was soon attacked by Mr Charles Leslie. In 1693, our author finding the great number of Protestant dissenters, in his diocese of Derry, increased by a vast addition of colonies from Scotland, in order to persuade them to conformity to the established church, published *A discourse concerning the inventions of men in the worship of God*. Mr Joseph Boyle, a dissenting minister, wrote an answer. The bishop answered Mr Boyle. The latter replied. The bishop rejoined. In 1702, he published at Dublin in 4to, his celebrated treatise *De origine mali*. Mr Edmund Law, M. A. fellow of Christ's-college in Cambridge, afterward published a complete translation of this, with very valuable notes; in 4to. In the second edition he has inserted, by way of notes, a large collection of the author's papers on the same subject, which he had received from his relations after the publication of the former edition. Our author, in this excellent treatise, has many curious observations. He asserts and proves, that there is more moral good in the earth than moral evil. A sermon by our author, preached at Dublin in 1709, was published under the title of *Divine predestination and foreknowledge consistent with the freedom of man's will*. This was attacked by Anthony Collins, esq; in a

pamphlet intitled, "*A vindication of the divine attributes; in some remarks on the archbishop of Dublin's sermon intitled, Divine predestination, &c.*" He published likewise, *A discourse concerning the consecration of churches; shewing what is meant by dedicating them, with the grounds of that office*. He died in 1729.

KING (Dr William), late principal of St Mary's-hall Oxford, son of the reverend Peregrine King, was born at Stepney in Middlesex, in the year 1685. He was made doctor of laws in 1715, was secretary to the duke of Ormond, and earl of Arran, as chancellors of the university; and was made principal of St Mary's-hall on the death of Dr Hudson in 1719. When he stood candidate for member of parliament for the university, he resigned his office of secretary, but enjoyed his other preferment, and it was all he did enjoy, to the time of his death. Dr Clark, who opposed him, carried the election; and after this disappointment, he, in the year 1727, went over to Ireland, where he is said to have written an epic poem, called *The tasks*, which was a political satire, printed and given away to his friends, but never sold. On the dedication of Dr Radcliff's library in 1749, he spoke a Latin oration in the theatre at Oxford, which was received with the highest acclamations; but it was otherwise when printed, he being attacked in several pamphlets on account of it. Again, at the memorable contested election in Oxfordshire 1755, his attachment to the old interest drew on him the resentment of the new, and he was libelled in newspapers and pamphlets, against which he defended himself in an *Apology*, and warmly retaliated on his adversaries. He wrote several other things, and died in 1762. He was a polite scholar, an excellent orator, an elegant and easy writer, and esteemed by the first men of his time for his learning and wit.

KING (Peter), lord high-chancellor of Great Britain, was descended of a good family of that name in Somersetshire, and son to an eminent grocer and saltier in the city of Exeter in Devonshire. He was born at Exeter in 1669, and bred up for some years to his father's business; but his inclination to learning was so strong, that he laid out all the money he could spare in books, and devoted every moment of his leisure hours to study; so that he became an excellent scholar before the world suspected any such thing; and gave the public a proof of his skill in church-history, in his *Inquiry into the constitution, discipline, unity, and worship, of the primitive church, that flourished within the first 300 years after Christ*, London, 1691, in 8vo. This was written with a view to promote the scheme of a comprehension of the dissenters. He afterwards published the second part of the *Inquiry into the constitution, &c.* and having desired, in his preface, to be shewn, either publicly or privately, any mistakes he might have made, that request was first complied with by Mr Edmund Elys; between whom and our author there passed several letters upon the subject, in 1692, which were published by Mr Elys in 1694, 8vo, under the title of *Letters on several subjects*. But the most formal and elaborate answer to the *Inquiry* appeared afterwards in a work entitled, *Original draught of the primitive church*.

His acquaintance with Mr Locke, to whom he was related, and who left him half his library at his death,

King.

was of great advantage to him : by his advice, after he had studied some time in Holland, he applied himself to the study of the law ; in which profession his learning and diligence made him soon taken notice of. In the two last parliaments during the reign of king William, and in five parliaments during the reign of queen Anne, he served as burgess for Beer-Alston in Devonshire. In 1702, he published at London, in 8vo, without his name, his *History of the apostles creed*, with critical observations on its several articles ; which is highly esteemed. In 1708, he was chosen recorder of the city of London ; and in 1710, was one of the members of the house of commons at the trial of Dr Sacheverell. In 1714, he was appointed lord chief justice of the common-pleas ; and, the April following, was made one of the privy-council. In 1715, he was created a peer, by the title of *Lord King, baron of Ockham in Surrey*, and appointed lord high chancellor of Great Britain ; in which post he continued till 1733, when he resigned ; and in 1734 died at Ockham in Surrey.

**KING at Arms, or of Arms**, is an officer of great antiquity, and anciently of great authority, whose business is to direct the heralds, preside at their chapters, and have the jurisdiction of armoury.

In England there are three kings of arms, viz. garter, clarencieux, and norroy.

**Garter, principal KING at arms**, was instituted by Henry V. His business is to attend the knights of the garter at their assemblies, to marshal the solemnities at the funerals of the highest nobility, and to carry the garter to kings and princes beyond the sea ; on which occasion he used to be joined in commission with some principal peer of the kingdom. See **GARTER**.

**Clarencieux KING at Arms**, is so called from the duke of Clarence, to whom he first belonged. His office is to marshal and dispose the funerals of all the inferior nobility, as baronets, knights, esquires, and gentlemen, on the south side of the Trent. See **CLARENCIEUX**.

**Norroy KING at Arms**, is to do the same on the north side of the river Trent.

These two last are also called *provincial heralds*, in regard they divide the kingdom between them into provinces. By charter, they have power to visit noblemen families, to set down their pedigrees, distinguish their arms, appoint persons their arms, and with garter, to direct the other heralds.

Anciently, the kings at arms were created, and solemnly crowned, by the kings of England themselves ; but of later days, the earl marshal has a special commission, at every creation, to perorate the king.

**Lyon KING at Arms**, for Scotland, is the second king at arms for Great Britain ; he is invested and crowned with great solemnity. To him belongs the publishing the king's proclamations, marshalling funerals, reversing arms, &c. See **LYON**.

**KING'S-BENCH**. This court (the nature of which was partly explained before) is divided into a *crown side* and a *plea side*. See **KING'S-BENCH**. And on the crown side, or crown office, it takes cognizance of all criminal causes, from high treason down to the most trivial misdemeanour or breach of the peace. Into this court also indictments from all inferior courts may be

Kingdom.

removed by writ of *certiorari*, and tried either at bar, or at *nisi prius*, by a jury of the county out of which the indictment is brought. The judges of this court are the supreme coroners of the kingdom. And the court itself is the principal court of criminal jurisdiction known to the laws of England. For which reason, by the coming of the court of King's bench into any county, (as it was removed to Oxford on account of the sickness in 1665), all former commissions of *oyer and terminer*, and general gaol-delivery, are at once absorbed and determined *ipso facto* : in the same manner as, by the old Gothic and Saxon constitutions, *Jure vetusto obtinuit, quiescere omnia inferiora judicia, dicente jus regis*. Into this court of King's bench hath reverted all that was good and salutary of the *star-chamber*. See **STAR-CHAMBER**.

**KINGDOM**, the territories or extent of country subject to a king.

**KINGDOMS**, in natural history. Most naturalists and chemists divide all natural bodies into three great classes, which they call *kingdoms*. These are the *mineral*, the *vegetable*, and the *animal* kingdoms.

This great and first division is founded on this consideration, that any plant or vegetable which is produced, which grows, which is organized, which contains a seed, and which produces its like, seems to be a being very distinct and different from a stone or a metal, in which we at most observe only a regular arrangement of parts, but not a true organization, and which contains no seed by which it is capable of reproduction ; and another foundation of this division is, that an animal differs no less from a simple plant, by sensation, by the use of its senses, and by the power of voluntary motion which it possesses, while these qualities do not belong to any thing which is merely vegetable.

But notwithstanding these so distinctive marks, philosophers pretend, that this division of natural bodies into classes is only ideal. They affirm, that, by observing nature attentively, we may perceive, that all her productions are connected together by an uninterrupted chain ; and that by surveying the several beings, we must be convinced, that any one being differs very little from some other two between which it seems to be placed ; so that we may descend from the most perfect animal to the rudest mineral by insensible degrees, and without finding any interval from which a division might be made. The opinions of naturalists are therefore divided upon this subject ; and each opinion seems to be founded upon observations, analogies, and reasonings, more or less conclusive.

If we avoid investigating extremes, however, the distinctive marks must be acknowledged sufficiently obvious to justify the triple division above mentioned, and to discriminate the individuals of each.

For a general view of the operations or conduct of nature in these her three kingdoms, see the article **NATURE**. For a particular consideration of them,—(in the animal-kingdom), see **ZOOLOGY**, **ANIMAL**, **BRUTE**, **BIRD**, **ORNITHOLOGY**, **FISH**, **COMPARATIVE ANATOMY**, and the different animals under their respective names ;—(in the vegetable kingdom), **BOTANY**, **PLANT**, **AGRICULTURE**, **VEGETATION**, **DEFOLIATION**, **FRONDESCENTIA**, **GEMMATIO**, **FRUIT**, **LEAF**, **GERMINATION**, &c. and the different plants under their

Kingdom. their respective names;—(in the mineral kingdom), MINERALOGY, METALLURGY, and the different stones and metals under their respective names.

In what remains of this article we shall consider natural bodies only in a chemical view; that is to say, relatively to the several principles which we obtain in the analysis of those bodies. In the decomposition of all beings truly living, organised, and containing within themselves a feed by which they may be reproduced, such as vegetables and animals, we always obtain an inflammable, fat, or oily substance; and on the contrary, we do not find the smallest trace of this principle in any substance purely mineral, not even in sulphur, which is the most inflammable of all these substances. On the other side, if we carefully examine and compare with each other the analogous principles obtained from the three kingdoms; such as the saline substances obtained in the analysis of animals, vegetables, and minerals; we shall easily perceive, that all the saline matter which comes from the vegetable or animal kingdoms is altered by oil, while all the saline matter which comes from the mineral kingdom is entirely free from oil.

We ought to observe here, that because any matter is found in one or more individuals of any kingdom, we must not therefore conclude, that it belongs to the kingdom of such individuals; for we may be convinced, from a slight observation of nature, that by a thousand combinations, and particular circumstances, substances of quite different classes or kingdoms are daily found mixed and confounded together. Thus, for example, within the earth, and even at great depths, that is, in the region appropriated to minerals, sometimes substances are found evidently oily, such as all bitumens; but we at the same time can prove, and all the observations of natural history prove, that these oily substances are only accidentally within the earth, and that they proceed from the vegetable or animal bodies which have been buried in the earth by some of those great revolutions which have happened from time to time upon the surface of our globe. Also in decomposing several vegetables and animals, salts are obtained; such as common salt, Glauber's salt, and others, which contain nothing oily, and which are consequently matters evidently mineral. But, on the other side, we are certain that these mineral salts are extraneous to the animals and vegetables in which they are found; that they are only introduced into these living bodies, because they happen to be mixed with the matters which have been applied to them as aliments, and that they ought not to be numbered amongst their principles. The proof of this is, that not only the quantity of these mineral salts is not uniform in animals and vegetables; but also, that not a particle of such salts is contained in some plants and animals equally strong and healthy, and of the same species as those in which these salts have generally been observed.

In the second place, we observe, that oils do only exist in the proximate principles of vegetables and animals; that is, in those of their principles which enter immediately into their composition, when these principles have not been altered by further decompositions, and consequently when they still preserve their animal or vegetable character; for by a natural putrefaction continued during a long time, or by chemical opera-

tions, not only the materials of which animal and vegetable bodies are formed may be deprived entirely of oil, but also this oil may itself be entirely destroyed or decomposed. These substances in that state contain nothing by which they can be distinguished from minerals. The earths, for example, of vegetables and animals, when they are deprived, by a sufficient calcination, of all inflammable matter, have been thought to become entirely similar to the calcareous and argillaceous earths found within the globe, and which may be considered as mineral substances, although probably they have been formerly a part of animal and vegetable bodies. See BOXES, in the APPENDIX.

Hence we conclude, that, when we consider natural bodies in a chemical view, we ought to divide them into two great classes. The first class is of substances inanimate, unorganised, and the principles of which have a degree of simplicity which is essential to them: these are minerals. The other class contains all those bodies which not only have been distinctly organised, but which also contain an oily matter, which is no where to be found in substances which have not made part of animate bodies, and which, by combining with all the other principles of these animate bodies, distinguishes these principles from those of minerals by a less degree of simplicity. This second class contains vegetables and animals. We ought also to remark, that the oil contained in vegetable and animal substances, renders them susceptible of fermentation, properly so called, which cannot by any means take place in any mineral.

We shall now proceed to examine, if, by comparing the principles obtained in the decomposition of vegetables with those obtained in the decomposition of animals, we can find some essential character by which these two kingdoms may be chemically distinguished, in the same manner as we have seen that both of them may be distinguished from minerals. From experiments we indeed learn, that the principles of vegetables differ evidently enough from those of animals; that in general the saline principles of the former are acid, and are transformable in great measure into fixed alkali by incineration, while the principle of the latter are volatile alkalis, or easily changeable into these; that vegetables are much farther removed from putrefaction than animals; lastly, that oils truly animal have a character different from vegetable oils, and are in general more attenuated, or at least more disposed to be attenuated and volatilised. But we must at the same time confess, that these differences are not clear and decisive, like those betwixt these two kingdoms and the mineral kingdom; for we do not find any essential principle, either in animals or in vegetables, which is not also to be found in the other. In some plants, chiefly the cruciform, as much volatile alkali, as little fixed alkali, and as much disposition to putrify, are found as in animal matters; and thence we conclude, that if these two great classes of natural bodies differ chemically from each other, this difference proceeds only from the quantities or proportions of their several principles and properties, and not from any thing distinct and peculiar; nor is it similar to the manner in which both vegetable and animal substances differ from minerals, namely, by containing an oil, and possessing a fermentable quality. Besides, the degrees of the chemi-

King's  
Kingston.

cal differences betwixt these three great classes of natural bodies are found to be the same, in whatever manner we consider them or compare them together. See *CHEMISTRY, passim*.

*Books of Kings*, two canonical books of the Old Testament, so called because they contain the history of the kings of Israel and Judah, from the beginning of the reign of Solomon, down to the Babylonish captivity, for the space of near 600 years.—It is probable that these books were composed by Ezra, who extracted them out of the public records, which were kept of what passed in that nation.

*KING'S-County*, a county of the province of Leinster in Ireland, taking its name from king Philip of Spain, husband to queen Mary. It is bounded on the north by West Meath; on the south by Tipperary and Queen's county, from which it is divided by the Barrow; and part of Tipperary and Galway on the west, from which it is separated by the Shannon. The length of it is about 40 miles, and the breadth about 20. This county was formerly full of bogs, but is now well drained and inhabited. It contains 11 baronies, and sends six members to parliament, viz. two for the county, and four for Philip's-town and Banatur.

*KING'S-Evil*. See (the *Index* subjoined to) *MEDICINE*.

*KINGHORN*, a town the county of Fife in Scotland, on the frith of Forth, directly opposite to Leith. Here is a manufacture of thread-stocks knit by the women; the men, being chiefly mariners, are employed in coasting ships, in the fishery, or the passage-boats from hence to Leith, from which the town of Kinghorn derives considerable advantage. This place gives a second title to the earl of Strathmore.

*KINGSTON*, a town of Surry in England, situated in W. Long. 0. 21. N. Lat. 51. 28. It takes its name from having been the residence of many of the Saxon kings, some of whom were crowned here. It is situated on the river Thames, over which there is here a wooden bridge of 20 arches, and here the summer assizes are generally held. Medals and coins of several Roman emperors are often found about this place; and east from it, upon a gravelly hill, was a burying-place of the Romans. There are several springs in the neighbourhood, whence water is conveyed in leaden-pipes under the Thames to Hampton-court. From another spring in a cellar near the town, flows a brook so large, that it has a bridge over it at Kingston. The town is large; and has a good market for corn, a free-school erected and endowed by queen Elizabeth, an alms-house founded by alderman Cleave of London, a spacious church with eight bells. In this church the pictures of Athelstan, Ethelred I. and II. Edwin, and Edward the Martyr, who were crowned here, and of king John, who gave the town its first charter, are preserved.

*KINGSTON*, a town of Ireland, in the province of Leinster, and capital of King's county. W. Long. 7. 20. N. Lat. 53. 15. It is otherwise called *Philipstown*.

*KINGSTON*, a town of Jamaica, in America, seated on the north side of the bay of Port-royal. It was built after the great earthquake in 1692; and is now a large thriving place, about a mile in length, and half a mile in breadth. It is laid out into little squares and cross-streets, and has one church. The Jews have two

synagogues here, and the Quakers a meeting-house. It is a place of good trade; and is much resorted to by merchants and seamen, because most of the ships come to load and unload their cargoes here. W. Long. 75. 52. N. Lat. 17. 40.

*KINGTON*, or *KYNETON*, a pretty large town in Herefordshire, with a good trade in narrow cloths. W. Long. 3. 5. N. Lat. 52. 10.

*KINROSS*, a town of the county of Fife in Scotland, situated in W. Long. 3. 7. N. Lat. 56. 15. on the west side of Lochleven, a fresh-water lake about 10 miles in compass, abounding with pike, trout, perch, and water-fowl. In the lake are two islands; on one of which appear the ruins of a priory, heretofore possessed by the Culdees; the other is famous for the castle in which queen Mary was imprisoned by her rebellious subjects. See (*History* of) *SCOTLAND*.

*KINSALE*, a town of the county of Cork in Ireland, situated at the mouth of the river Ban, or Brandon, in W. Long. 8. 20. N. Lat. 51. 32. It is reckoned the third town in the kingdom, and inferior only to Cork in point of trade. Vast quantities of provisions are shipped off from hence to Flanders, Holland, France, and the West Indies. The port indeed is barred, but ships of any burden may get over the bar at high water. On a point of land, called the *old head* of *Kinsale*, is a light-house to guide ships in the night to the mouth of the river. The town is neat, well built, wealthy, and extremely well fortified with lines and outworks. About two miles below the town are two strong forts, one on each side the river, which secure it against all attempts by sea. Kinsale gives the title of *baron* to the very ancient family of Courcy.

*KINTORE*, a royal borough of Aberdeenshire in Scotland, situated on the river Don, in W. Long. 2. 5. N. Lat. 57. 38. It gives the title of *earl* to a branch of the noble family of Keith, but in other respects is inconsiderable.

*KINTYRE*, or *CANTYRE*, from *Cantierre*, signifying a "headland;" the southern division of the shire of Argyle in Scotland. It is a peninsula, stretching 37 miles from north to south, and seven miles in breadth. It is mostly plain, arable, and populous; inhabited promiscuously by Highlanders and Lowlanders; the latter being invited to settle in this place by the Argyle family, that the lands might be the better cultivated. It gives the title of *marquis* to the duke, and is by Lochfyn divided from Argyle Proper. This loch is an inlet from the sea, about 60 miles in length and four in breadth, affording heretofore an excellent herring-fishery. There are many paltry villages in this country, but no town of any consequence except Campbeltown.

*KIOF*, or *KIOU*, a considerable town of Poland, and capital of the Ukraïn, in the palatinate of the same name, with an archbishop's-see and a castle. It belongs to Russia, and carries on a considerable trade. It is divided into the Old and New Town; and seated on the river Nieper, in E. Long. 31. 51. N. Lat. 50. 12.

*KIPPING* (Henry), in Latin *Kippingius*, a learned German Lutheran, born at Bostock; where, after having received the degree of master of arts, he was met by some soldiers, who pressed him into the service. This, however, did not prevent his following his studies. One day while he was upon duty, holding his

musket in one hand, and the poet Statius in the other, a Swedish counsellor, who perceived him in that attitude, came up to him, entered into discourse with him, and then taking him to his house, made him his librarian, and procured him the under-rector of the college of Bremen, where he died in 1678. He wrote many works in Latin; the principal of which are, 1. A treatise on the antiquities of the Romans. 2. Another on the works of Creation. 3. Several dissertations on the Old and New Testament, &c.

KIRCH (Christian Frederic), of Berlin, a celebrated astronomer, was born at Guben in 1694; and acquired great reputation in the observatories of Dantzic and Berlin. Godfrey Kirch his father, and Mary his mother, acquired considerable reputation by their astronomical observations. This family corresponded with all the learned societies of Europe; and their astronomical works are in high repute.

KIRCHER (Athanasius), a famous philosopher and mathematician, was born at Fulde in 1601. In 1618 he entered into the society of the Jesuits; and taught philosophy, mathematics, the Hebrew and Syriac languages, in the university of Wirtzburg, with great applause till the year 1631. He went to France, on account of the ravages committed by the Swedes in Franconia, and lived some time at Avignon. He was afterwards called to Rome, where he taught mathematics in the Roman college, collected a rich cabinet of machines and antiquities, and died in 1680.—The quantity of his works is immense; amounting to 22 vols in folio, 11 in 4to, and 3 in 8vo; enough to employ a man for a great part of his life even to transcribe them. Most of them are rather curious than useful; many of them visionary and fanciful; and if they are not always accompanied with the greatest exactness and precision, the reader, it is presumed, will not be astonished. The principal of his works are, 1. *Prælectiones mathematicæ*. 2. *Primitia gnomonica catoptrica*. 3. *Arts magna lucis & umbræ*. 4. *Mysurgia universalis*. 5. *Obeliscus Pamphilus*. 6. *Oedipus Egyptiacus*, four volumes, folio. 7. *Itinerarium extaticum*. 8. *Obeliscus Egyptianus*, in four volumes, folio. 9. *Mundus subterraneus*. 10. *China illustrata*.

KIRCHMAN (John), an eminent German divine, was born at Lubec, in 1575. He studied in several places of Germany; in 1602 was made professor of poetry at Rostock, and in 1613 rector of the university at Lubec. He exercised this last employment with an extraordinary application, during the rest of his life; and died in 1643. He wrote several works; the most esteemed of which are, 1. *De funeribus Romanorum*. 2. *De annulis liber singularis*.

KIRIATHAIM, (anc. geog.), one of the towns built by the Reubenites; reckoned to the tribe of Reuben (Joshua xiii.), 12 miles to the west of Midaba. The ancient residence of the giants called *Emin*.

KIRIATH-ARBA. See *HEBRON*.

KIRK, a Saxon term, signifying the same with church.

KIRK-Ofawald, a market-town of Cumberland, 12 miles south of Carlisle.

KIRK-Sessions, an inferior church-judicatory in Scotland, consisting of the ministers, elders, and deacons of a parish.

It regulates matters relating to public worship, catechising, visitations, &c. and judges in case of fornication and lesser scandals.

KIRKALDY, a town of the county of Fife in Scotland, two miles to the north-east of Kinghorn. It is a royal borough, the seat of a presbytery, and gives the title of *baron* to the earl of Melville. The town is populous, well built, and extends a mile in length from east to west, enjoying a tolerable share of trade by exporting its own produce and manufactures of corn, coal, linen, and salt. W. Long. 3. o. N. Lat. 56. 8.

KIRKCUDBRIGHT, beginning at the middle of Dumfries-shire in Scotland, makes a considerable part of Galloway, of which the earls of Nithisdale were hereditary stewards. The face of the country exhibits the appearance of one continued heath, producing nothing but pasture for sheep and small black cattle, which are generally sold in England; yet these dusky moors are intersected with pleasant valleys, and adorned with a great number of castles belonging to private gentlemen, every house being surrounded with an agreeable plantation. It is watered by the river Dee; which, taking its rise from the mountains near Carrick, runs through a tract of land about 70 miles in length, and, entering the Irish sea, forms the harbour of Kirkcudbright, a small inconsiderable borough, admirably situated for the fishery and other branches of commerce, which are almost totally neglected thro' the poverty and indolence of the inhabitants. There is no other town of any consequence in this shewartry.

KIRSTENIUS (Peter), professor of physic at Upsal, and physician extraordinary to the queen of Sweden, was born at Breslaw in 1577. He studied Greek, Latin, Hebrew, Syriac, natural philosophy, anatomy, botany, and other sciences. Being told that a man could not distinguish himself in physic, unless he understood Avicenna, he applied himself to the study of Arabic; and not only to read Avicenna, but also Mesue, Rhasis, Abenzoar, Abukafis, and Averroes. He visited Spain, Italy, England, and did not return home from his travels till after seven years. He was chosen by the magistrates of Breslaw to have the direction of their college and of their schools. A fit of sickness having obliged him to resign that difficult employment, with which he was also much disgusted, he applied himself chiefly to the practice of physic, and went with his family into Prussia. Here he obtained the friendship and esteem of the chancellor Oxenstiern, whom he accompanied into Sweden; where he was made professor of physic in the university of Upsal, and physician to the queen. He died in 1640. It is said in his epitaph, that he understood 26 languages. He wrote many works; among which are, 1. *Liber secundus Canonis Avicennæ, typis Arabicis, ex MSS. editus, et ad verbum in Latinum translatus*, in folio. 2. *De vero usu et abusu Medicinæ*. 3. *Grammatica Arabica*, folio. 4. *Vite quatuor E. evangelistarum, ex antiquissimo codice MSS. Arabico erute*, in folio. 5. *Notæ in Evangelium S. Matthæi, ex collatione textuum Arabicorum, Syriacorum, Ægyptiacorum, Græcorum, & Latinorum*, in folio, &c.

He ought not to be confounded with *George Kirstenius*, another learned physician and naturalist, who was born at Stettin, and died in 1660; and also wrote several

Kirstenius.

Kit-kat  
Kitchen.

several works which are esteemed.

**KIT-KAT CLUB**, an association of above 30 noblemen and gentlemen of distinguished merit, formed in 1703, purely to unite their zeal in favour of the protestant succession in the house of Hanover. Their name was derived from Christopher Kat a pastry-cook, near the tavern where they met in King's-street Westminster, who often supplied them with tarts. Old Jacob Tonson was their bookseller; and that family is in possession of a picture of the original members of this famous club, painted by Sir Godfrey Kneller. The design of these gentlemen was to recommend and encourage true loyalty by the powerful influence of wit and humour; and Sir Samuel Garth distinguished himself by the extempore epigrams he made on their toasts, which were inscribed on their drinking-glasses.

**KIRKWALL**, the capital of the Orkneys, situated in the island of Pomona, in W. Long. o. 25. N. 58. 33. It is built upon an inlet of the sea, near the middle of the island, having a very safe road and harbour for shipping. It is a royal borough, governed by a provost, four bailiffs, and a common-council. It was formerly possessed by the Norwegians, who bestowed upon it the name of *Cruccivicia*. From king James III. of Scotland, they obtained a new charter, empowering them to elect their own magistrates yearly, to hold borough-courts, arrest, imprison, make laws and ordinances for the right government of the town; to have a weekly market, and three fairs annually at certain fixed terms: he moreover granted them some lands adjoining to the town, with the customs and shore-dues, the power of a pit and gallows, and exempted them from the expence of sending commissioners to parliament. This charter has been confirmed by succeeding monarchs. At present Kirkwall is the seat of justice, where the steward, sheriff, and commissary, hold their several courts of jurisdiction: Here is likewise a public grammar-school, endowed with a competent salary for the master. The town consists of one narrow street about a mile in length; the houses are chiefly covered with slate, tho' not at all remarkable for neatness and convenience.—The principal edifices are the cathedral church, and the bishop's palace. The former, called *St Magnus*, from Magnus king of Norway, the supposed founder of the town, is a large gothic structure: the roof is supported by 14 pillars on each side, and the spire is built upon four large columns. The gates are decorated with a kind of Mosaic work, of red and white stones elegantly carved and flowered. By the ruins of the king's castle, or citadel, it appears to have been a strong and stately fortress. At the north end of the town there is a sort of fortification built by the English in the time of Oliver Cromwell. It is surrounded with a ditch and rampart, and still mounted with some cannon for the defence of the harbour.

**KITCHEN**, the room in a house where the provisions are cooked.

**Army KITCHEN**, is a space of about 16 or 18 feet diameter, with a ditch surrounding it three feet wide; the opposite bank of which serves as a seat for the men who dress the victuals. The kitchens of the flank companies are contiguous to the outline of the camp; and the intermediate space is generally distributed equally

for the remaining kitchens; and as each tent forms a mess, each kitchen must have as many fire-places as there are tents in the company.

**KITCHEN-Garden**, a piece of ground laid out for the cultivation of fruit, herbs, pulse, and other vegetables used in the kitchen.

A kitchen-garden ought to be situated on one side of the house, near the stables, from whence the dung may be easily conveyed into it; and after having built the wall, borders should be made under them; which, according to Miller, ought to be eight or ten feet broad: upon those borders exposed to the south, many sorts of early plants may be sown; and upon those exposed to the north, you may have some late crops, taking care not to plant any sort of deep-rooting plants, especially beans and pease, too near the fruit-trees. You should next proceed to divide the ground into quarters: the best figures for these is a square, or an oblong, if the ground will admit of it; otherwise they may be of that shape which will be most advantageous to the ground: the size of these quarters should be proportioned to that of the garden; if they are too small, your ground will be lost in walks, and the quarters being inclosed by espaliers of fruit-trees, the plants will draw up slender, for want of a more open exposure. The walks should also be proportioned to the size of the ground: these in a small garden should be six feet broad, but in a large one ten; and on each side of the walk there should be allowed a border three or four feet wide, between it and the espalier; and in these borders may be sown some small salads, or any other herbs that do not take deep root or continue long: but these quarters should not be sown or planted with the same crop two years together. In one of these quarters, situated nearest to the stables, and best defended from the cold winds, should be the hot-beds, for early cucumbers, melons, &c. and to these there should be a passage from the stables, and a gate through which a small cart may enter. The most important points of general culture consist in well digging and manuring the soil; and giving a proper distance to each plant, according to their different growths: as also in keeping them clear from weeds; for which purpose, you should always observe to keep your dung-hills clear from them, otherwise their seeds will be constantly brought in and spread with the dung.

**KLEIST** (Edward Christian de), a celebrated German poet, and a soldier of distinguished bravery, was born at Zeblin, in Pomerania, in 1715. At nine years of age he was sent to pursue his studies at Cron in Poland; and he afterwards studied at Dantzick and Konigsberg. Having finished his studies, he went to visit his relations in Denmark, who invited him to settle there; and having in vain endeavoured to obtain preferment in the law, at 21 years of age accepted of a post in the Danish army. He then applied himself to the study of all the sciences that have a relation to military affairs, with the same assiduity as he had before studied civil law. In 1740, at the beginning of the reign of Frederic king of Prussia, Mr de Kleist went to Berlin, and was presented to his Majesty, who made him Lieutenant of his brother prince Henry's regiment; and he was in all the campaigns

Kleist.

paigms which distinguished the five first years of the king of Prussia's reign. In 1749 he obtained the post of captain; and in that year published his excellent poem on the Spring. Before the breaking out of the last war, the king chose him, with some other officers at Potsdam, companion to the young prince Frederick-William of Prussia, and to eat at his table. In the first campaign, in 1756, he was nominated major of Hausen's regiment; which being in garrison at Leipzig, he had time to finish several new poems. After the battle of Rosbach, the king gave him, by an order in his own hand-writing, the inspection of the great hospital established at Leipzig. And on this occasion his humanity was celebrated by the sick and wounded of both parties, and his disinterestedness was equally admired by all the inhabitants of that city. In 1758, prince Henry coming to Leipzig, Mr Kleist desired to serve in his army with the regiment of Hausen, which was readily granted. Opportunities of distinguishing himself could not be wanting under that great officer, and he always communicated his courage to the battalion under his command. He also served that prince at the beginning of the campaign of 1759, when he was with him in Franconia, and in all the expeditions of that army, till he was detached with the troops under general de Fink to join the king's army. On the 12th of August was fought the bloody battle of Kunersdorf, in which he fell. He attacked the flank of the Russians, and assisted in gaining three batteries. In these bloody attacks he received twelve contusions; and the two first fingers of his right hand being wounded, he was forced to hold his sword in the left. His post of major obliged him to remain behind the ranks; but he no sooner perceived the commander of the battalion wounded and carried away, than he instantly put himself at the head of his troop. He led his battalion in the midst of the terrible fire of the enemies artillery, against the fourth battery. He called up the colours of the regiment; and, taking an ensign by the arm, led him on. Here he received a ball in his left arm; when, being no longer able to hold his sword in his left hand, he took it again in the right, and held it with the two last fingers and his thumb. He still pushed forward, and was within thirty steps of the battery when his right leg was shattered by the wadding of one of the great guns; and he fell from his horse, crying to his men, "My boys, don't abandon your king." By the assistance of those who surrounded him, he endeavoured twice to remount his horse; but his strength forsook him, and he fainted. He was then carried behind the line; where a surgeon, attempting to dress his wounds, was shot dead. The Coffees arriving soon after, stripped Mr Kleist naked, and threw him into a mirey place; where some Russian hussars found him in the night, and laid him upon some straw near the fire of the grand guard, covered him with a cloak, put a hat on his head, and gave him some bread and water. In the morning one of them offered him a piece of silver, which he refused; on which he tossed it upon the cloak that covered him, and then departed with his companions. Soon after the Coffees returned, and took all that the generous hussars had given him. Thus he again lay naked on the earth; and in that cruel situation continued till noon, when he was known by

VOL. VI.

a Russian officer, who caused him to be conveyed in a waggon to Frankfort on the Oder; where he arrived in the evening, in a very weak state, and was instantly put into the hands of the surgeons. But the fractured bones separating, broke an artery, and he died by the loss of blood. The city of Frankfort being then in the hands of the enemy, they buried this Prussian hero with all military honours: the governor, a great number of the Russian officers, the magistrates of the city, with the professors and the students, formed the procession, preceded by the funeral music. Mr Kleist's poems, which are greatly admired, are elegantly printed in the German tongue, in 2 volumes 8vo.

KNARESBOROUGH, a town in the West Riding of Yorkshire in England. It is an ancient borough by prescription, governed by a bailiff, who, with the burgesses, elects the members of parliament, and its market is excellent for corn. This town is noted for its petrifying well, and three medicinal springs; one being a kind of vitriolic spaw, another sulphureous, and the other a cold bath, being all within a few miles. The adjacent fields afford great plenty of liquorice. It is seated on a rough ragged rock, by the river Nid, and is adorned with a castle. W. Long, i. 6. N. Lat. 54. o.

KNAPDALE, one of the divisions of Argyleshire in Scotland. It is parted from Cowal on the east by Lochfyne, borders with Kintyre on the south, with Lorn on the north, by Braidalbin on the north-east, and on the west by the Hebrides. Its length from north to south does not exceed 20 miles, and the breadth in some places may amount to 13. It is joined to Kintyre by a neck of land not above a mile broad, over which the country people draw their boats, to avoid sailing round Kintyre. This part of Knapdale abounds with lakes, some of them containing little islands, on which there are castles belonging to different proprietors. The ground is more adapted for pasturage than grain; but that on the side of Lochow is fruitful in both.

KNAPSACK, in a military sense, a rough leather bag which a soldier carries on his back, and which contains all his necessaries. Square knapsacks are most convenient; and should be made with a division to hold the shoes, black-ball and brushes, separate from the linen. White goat-skins are the best.

KNAVE, an old Saxon word, which had at first a sense of simplicity and innocence, for it signified a *boy* Sax. *cnapa*, whence a *knave-child*, i. e. a boy, distinguished from a girl, in several old writers; afterwards it was taken for a servant-boy, and at length for any servant-man. Also it was applied to a minister or officer that bore the shield or weapon of his superior; as *field-knave*, whom the Latins call *armiger*, and the French *escuyer*, 14 Edw. III. c. 3. And it was sometimes of old made use of as a titular addition; as *Joannis C. filius Willielmi C. de Derby, knave, &c.* 22 Hen. VII. c. 37. The word is now perverted to the hardest meaning, viz. a *false deceitful fellow*.

KNAVESHIP, in Scots law, one of the names of the small duties payable in thirlage to the miller's servants, called *sequals*.

KNEE, in anatomy, the articulation of the thigh and leg bones.

Knaref-  
borough  
||  
Knee.

**KNEE**, in a ship, a crooked piece of timber, having two branches, or arms, and generally used to connect the beams of a ship with her sides or timbers.

The branches of the knees form an angle of greater or smaller extent, according to the mutual situation of the pieces which they are designed to unite. One branch is securely bolted to one of the deck-beams, whilst the other is in the same manner attached to a corresponding timber in the ship's side, as represented by E in the plate of *MIDSHIP-FRAME*.

Besides the great utility of knees in connecting the beams and timbers into one compact frame, they contribute greatly to the strength and solidity of the ship, in the different parts of her frame to which they are bolted; and thereby enable her, with greater firmness, to resist the effects of a turbulent sea.

In fixing of these pieces, it is occasionally necessary to give an oblique direction to the vertical or side branch, in order to avoid the range of an adjacent gun-port, or, because the knee may be so shaped as to require this disposition; it being sometimes difficult to procure so great a variety of knees as may be necessary in the construction of a number of ships of war.

In France, the scarcity of these pieces has obliged their ship-wrights frequently to form their knees of iron.

Knees are either said to be *lodging* or *hanging*. The former are fixed horizontally in the ship's frame, having one arm bolted to the beam, and the other across two or three timbers, as represented in the *DECK*, Pl. LXXXIII. The latter are fixed vertically, as we have described above. See also *SHIP-BUILDING*, *DECK*, and *MIDSHIP-FRAME*.

**KNEE of the Head**, a large flat piece of timber, fixed edgewise upon the fore-part of a ship's stem, and supporting the ornamental figure or image placed under the bowprit. See *SHIP-BUILDING*.

The *knee of the head*, which may properly be defined a continuation of the stem, as being prolonged from the stem forwards, is extremely broad at the upper-part, and accordingly composed of several pieces united into one, YY, (*Pieces of the Hull*, in *SHIP-BUILDING* Plates). It is let into the head, and secured to the ship's bows by strong knees fixed horizontally upon both, and called the *cheeks of the head*. The heel of it is scarfed to the upper-end of the fore-foot; and it is fastened to the stem above by a knee, called a *standard*, expressed by & in the plate.

Besides supporting the figure of the head, this piece is otherwise useful, as serving to secure the boom, or bumm, by which the fore-tack is extended to windward; and, by its great breadth, preventing the ship from falling to leeward when close-hauled, so much as she would otherwise do. It also affords a greater security to the bowprit, by increasing the angle of the bob-stay, so as to make it act more perpendicularly on the bowprit.

The *knee of the head* is a phrase peculiar to ship-wrights; as this piece is always called the *cut-water* by seamen, if we except a few, who, affecting to be wiser than their brethren, have adopted this expression probably on the presumption that the other is a cant-phrase or vulgarity.

*Carling KNEES*, in a ship, those timbers which ex-

tend from the ship to the hatch-way, and bear up the deck on both sides.

**KNELLER** (Sir Godfrey), a painter, whose fame is well established in these kingdoms. He was born at Lubeck in 1643; and received his first instructions in the school of Rembrandt, but became afterwards a disciple of Ferdinand Bol. When he had gained as much knowledge as that school afforded him, he travelled to Rome, where he fixed his particular attention on Titian and the Caracci. He afterwards visited Venice, and distinguished himself so effectually in that city by his historical pictures, and portraits of the noble families there, that his reputation became considerable in Italy. By the advice of some friends he came at last to England, where it was his good fortune to gain the favour of the duke of Monmouth: by his recommendation, he drew the picture of king Charles II. more than once; who was so taken with his skill in doing it, that he used to come and sit to him at his house in Covent-garden piazza. The death of Sir Peter Lely left him without a competitor in England, and from that time his fortune and fame were thoroughly established. No painter could have more incessant employment, and no painter could be more distinguished by public honour. He was state-painter to Charles II. James II. William III. queen Anne, and George I. equally esteemed and respected by them all: the emperor Leopold made him a knight of the Roman empire, and king George I. created him a baronet. Most of the nobility and gentry had their likenesses taken by him, and no painter excelled him in a sure outline, or in the graceful disposition of his figures: his works were celebrated by the best poets in his time. He built himself an elegant house at Whitton near Hampton-court, where he spent the latter part of his life; and died in 1726.

**KNIFE**, a well-known instrument, made for cutting.—All sorts of knives are prohibited to be imported.

**KNIGHT** (*æques*), among the Romans, a person of the second degree of nobility, following immediately that of the senators.

Part of the ceremony whereby this honour was conferred, was the giving of an horse; for each had an horse at the public charge, and received the stipend of a horseman to serve in the wars.

When the knights were taken in among the senators, they resigned the privilege of having an horse kept for them at the charge of the public: then it became necessary, in order to be a knight, that they should have a certain revenue, that their poverty might not disgrace the order; and when they failed of the prescribed revenue, they were expunged out of the list of knights, and thrust down among the Plebeians. Ten thousand crowns is computed to have been the revenue required.

The knights at length grow so very powerful, that they became a balance between the power of the senate and people: they neglected the exercises of war, and betook themselves principally to civil employments in Rome.

**KNIGHT**, or *Cnecht* (Germ.), in feudal history, was originally an appellation or title given by the ancient Germans to their youth after being admitted to the privilege of bearing arms.

Knight-  
hood.

The passion for arms among the Germanic states, as described by Dr Stuart \*, was carried to extremity. It was amidst scenes of death and peril that the young were educated: it was by valour and feats of prowess that the ambitious signalized their manhood. All the honours they knew were allotted to the brave. The sword opened the path to glory. It was in the field that the ingenuous and the noble flattered most their pride, and acquired an ascendancy. The strength of their bodies, and the vigour of their counsels, surrounded them with warriors, and lifted them to command.

But, among these nations, when the individual felt the call of valour, and wished to try his strength against an enemy, he could not of his own authority take the lance and the javelin. The admission of their youth to the privilege of bearing arms, was a matter of too much importance to be left to chance or their own choice. A form was invented by which they were advanced to that honour.

The council of the district, or of the canton to which the candidate belonged, was assembled. His age and his qualifications were inquired into; and, if he was deemed worthy of being admitted to the privileges of a soldier, a chieftain, his father, or one of his kindred, adorned him with the shield and the lance. In consequence of this solemnity, he prepared to distinguish himself; his mind opened to the cares of the public; and the domestic concerns, or the offices of the family from which he had sprung, were no longer the objects of his attention. To this ceremony, so simple and so interesting, the institution of *knighthood* is indebted for its rise.

Knighthood, however, as a system, known under the denomination of *CHIVALRY*, is to be dated only from the 11th century. All Europe being reduced to a state of anarchy and confusion on the decline of the house of Charlemagne, every proprietor of a manor or lordship became a petty sovereign; the mansion-house was fortified by a moat, defended by a guard, and called a *castle*. The governor had a party of 700 or 800 men at his command; and with these he used frequently to make excursions, which commonly ended in a battle with the lord of some petty state of the same kind, whose castle was then pillaged, and the women and treasures borne off by the conqueror. During this state of universal hostility, there was no friendly communications between the provinces, nor any high roads from one part of the kingdom to another: the wealthy traders, who then travelled from place to place with their merchandize and their families, were in perpetual danger; the lord of almost every castle extorted something from them on the road; and at last, some one more rapacious than the rest, seized upon the whole of the cargo, and bore off the women for his own use.

Thus castles became the warehouses of all kinds of rich merchandize, and the prisons of the distressed females whose fathers or lovers had been plundered or slain, and who being, therefore, seldom disposed to take the thief or murderer under favour, were in continual danger of a rape.

But as some are always distinguished by virtue in the most general defection, it happened that many lords insensibly associated to repress these sallies of vio-

lence and rapine, to secure property, and protect the ladies. Among these were many lords of great siefs; and the association was at length strengthened by a solemn vow, and received the sanction of a religious ceremony. As the first knights were men of the highest rank, and the largest possessions, such having most to lose, and the least temptation to steal, the fraternity was regarded with a kind of reverence, even by those against whom it was formed. Admission into the order was deemed the highest honour; many extraordinary qualifications were required in a candidate, and many new ceremonies were added at his creation. After having fasted from sun-rise, confessed himself, and received the sacrament, he was dressed in a white tunic, and placed by himself at a side-table, where he was neither to speak, to smile, nor to eat; while the knights and ladies, who were to perform the principal parts of the ceremony, were eating, drinking, and making merry at the great table. At night his armour was conveyed to the church where the ceremony was performed; and here having watched it till the morning, he advanced with his sword hanging about his neck, and received the benediction of the priest. He then kneeled down before the lady who was to put on his armour, who being assisted by persons of the first rank, buckled on his spurs, put an helmet on his head, and accoutred him with a coat of mail, a cuirass, bracelets, cuisses, and gauntlets.

Being thus armed cap-a-pee, the knight who dubbed him struck him three times over the shoulder, with the flat side of his sword, in the name of God, St Michael, and St George. He was then obliged to watch all night in all his armour, with his sword girded, and his lance in his hand. From this time the knight devoted himself to the redress of those wrongs which "patient merit of the unworthy takes;" to secure merchants from the rapacious cruelty of banditti, and women from ravishers, to whose power they were, by the particular confusion of the times, continually exposed.

From this view of the origin of chivalry, it will be easy to account for the castle, the moat, and the bridge, which are found in romances; and as to the dwarf, he was a constant appendage to the rank and fortune of those times, and no castle therefore could be without him. The dwarf and the buffoon were then introduced to kill time, as the card-table is at present. It will also be easy to account for the multitude of captive ladies, whom the knights, upon seizing a castle, set at liberty; and for the prodigious quantities of useless gold and silver vessels, rich stuffs, and other merchandize, with which many apartments in these castles are said to have been filled.

The principal lords who entered into the confraternity of knights, used to fend their sons to each other, to be educated, far from their parents, in the mystery of chivalry. These youths, before they arrived at the age of 21, were called *bachelors*, or *bas chevaliers*, inferior knights, and at that age were qualified to receive the order.

So honourable was the origin of an institution, commonly considered as the result of caprice, and the source of extravagance; but which, on the contrary, rose naturally from the state of society in those times, and had a very ferious effect in refining the manners of the European nations. Valour, humanity, courtesy,

Knight-  
hood.

cety in Eu-  
rope, p. 46.

justice, honour, were its characteristics: and to these were added religion; which, by infusing a large portion of enthusiastic zeal, carried them all to a romantic excess, wonderfully suited to the genius of the age, and productive of the greatest and most permanent effects both upon policy and manners. War was carried on with less ferocity, when humanity, no less than courage, came to be deemed the ornament of knight-hood, and knight-hood a distinction superior to royalty, and an honour which princes were proud to receive from the hands of private gentlemen: more gentle and polished manners were introduced, when courtesy was recommended as the most amiable of knightly virtues, and every knight devoted himself to the service of a lady: violence and oppression decreased, when it was accounted meritorious to check and to punish them: a scrupulous adherence to truth, with the most religious attention to fulfil every engagement, but particularly those between the sexes as more easily violated, became the distinguishing character of a gentleman, because chivalry was regarded as the school of honour, and inculcated the most delicate sensibility with respect to that point; and valour, seconded by so many motives of love, religion, and virtue, became altogether irresistible.

That the spirit of chivalry sometimes rose to an extravagant height, and had often a pernicious tendency, must however be allowed. In Spain, under the influence of a romantic gallantry, it gave birth to a series of wild adventures, which have been deservedly ridiculed: in the train of Norman ambition, it extinguished the liberties of England, and deluged Italy in blood; and at the call of superstition, and as the engine of papal power, it desolated Asia under the banner of the cross. But these ought not to be considered as arguments against an institution laudable in itself, and necessary at the time of its foundation: and those who pretend to despise it, the advocates of ancient barbarism and ancient rascality, ought to remember, that chivalry not only first taught mankind to carry the civilities of peace into the operations war, and to mingle politeness with the use of the sword; but roused the soul from its lethargy, invigorated the human character even while it softened it, and produced exploits which antiquity cannot parallel. Nor ought they to forget, that it gave variety, elegance, and pleasure, to the intercourse of life, by making woman a more essential part of society; and is therefore entitled to our gratitude, though the point of honour, and the refinements in gallantry, its more doubtful effects, should be excluded from the improvement of modern manners. For,

To illustrate this topic more particularly, we may observe, that women, among the ancient Greeks and Romans, seem to have been considered merely as objects of sensuality, or of domestic convenience: they were devoted to a state of seclusion and obscurity, had few attentions paid them, and were permitted to take as little share in the conversation, as in the general commerce of life. But the northern nations, who paid a kind of devotion to the softer sex, even in their native forests, had no sooner settled themselves in the provinces of the Roman empire, than the female character began to assume new consequence. Those fierce barbarians, who seemed to thirst only for blood, who

involved in one undistinguishing ruin the monuments of ancient grandeur and ancient ingenuity, and who devoted to the flames the knowledge of ages, always forbore to offer any violence to the women. They brought along with them the respectful gallantry of the north, which had power even to restrain their savage ferocity; and they introduced into the west of Europe, a generosity of sentiment, and a complaisance toward the ladies, to which the most polished nations of antiquity were strangers.—These sentiments of generous gallantry were fostered by the institution of chivalry, which lifted woman yet higher in the scale of life. Instead of being nobody in society, she became its *primum mobile*. Every knight devoting himself to danger, declared himself the humble servant of some lady, and that lady was often the object of his love. Her honour was supposed to be intimately connected with his, and her smile was the reward of his valour: for her he attacked, for her he defended, and for her he shed his blood. Courage, animated by so powerful a motive, lost sight of every thing but enterprise: incredible toils were cheerfully endured; incredible actions were performed; and adventures seemingly fabulous were more than realized. The effect was reciprocal. Women, proud of their influence, became worthy of the heroism which they had inspired: they were not to be approached but by the high-minded and the brave; and men then could only be admitted to the bosom of the chaste fair, after proving their fidelity and affection by years of perseverance and of peril.

Again, as to the change which took place in the operations of war, it may be observed, that the perfect hero of antiquity was superior to fear, but he made use of every artifice to annoy his enemy: impelled by animosity and hostile passion, like the savage in the American woods, he was only anxious of attaining his end, without regarding whether fraud or force were the means. But the true knight or modern hero of the middle ages, who seems in all his encounters to have had his eye on the judicial combat, or judgment of God, had an equal contempt for stratagem and danger. He disdained to take advantage of his enemy: he desired only to see him, and to combat him upon equal terms, trusting that heaven would declare in behalf of the just; and as he professed only to vindicate the cause of religion, of injured beauty or oppressed innocence, he was further confirmed in this enthusiastic opinion by his own heated imagination. Strongly persuaded that the decision must be in his favour, he fought as if under the influence of divine inspiration, rather than of military ardour. Thus the system of chivalry, by a singular combination of manners, blended the heroic and sanctified characters, united devotion and valour, zeal and gallantry, and reconciled the love of God and of the ladies.

Chivalry flourished most during the time of the croisades. From these holy wars it followed, that new fraternities of knight-hood were invented: hence the knights of the Holy Sepulchre, the Hospitallers, Templars, and an infinite number of religious orders. Various other orders were at length instituted by sovereign princes: the Garter, by Edward III. of England; the Golden Fleece, by Philip the Good, duke of Burgundy; and St Michael, by Lewis XI. of France. From this time ancient chivalry declined to

an empty name; when sovereign princes established regular companies in their armies, knights-bannerets were no more, though it was still thought an honour to be dubbed by a great prince or victorious hero; and all who profess'd arms without knighthood, assumed the title of *esquire*.

There is scarce a prince in Europe that has not thought fit to institute an order of knighthood; and the simple title of *knight*, which the kings of Britain confer on private subjects, is a derivation from ancient chivalry, although very remote from its source. See *Knight-BACHELOR*.

*Knight-Service*, (*servitium militare*, and in law-French *chivalry*); a species of TENURE, the origin and nature of which are explained under the articles CHIVALRY, and FEODAL SYSTEM, n° 13.—21.

The knights produced by this tenure differed most essentially from the knights described in the preceding article; though the difference seems not to have been accurately attended to by authors (A). The one class of knights was of a high antiquity; the other was not heard of till the invention of a fee. The adorning with arms and the blow of the sword, made the act of the creation of the ancient knight; the new knight was constituted by an investment in a piece of land. The former was the member of an order of dignity which had particular privileges and distinctions; the latter was the receiver of a feudal grant. Knighthood was an honour; knight-service a tenure. The first communicated splendour to an army; the last gave it strength and numbers. The knight of honour might serve in any station whatever; the knight of tenure was in the rank of a soldier.—It is true, at the same time, that every noble and baron were knights of tenure, as they held their lands by knight-service. But the number of fees they possessed, and their creation into rank, separated them widely from the simple individuals, to whom they gave

out grants of their lands, and who were merely the knights of tenure. It is no less true, that the sovereign, without conferring nobility, might give even a single fee to a tenant; and such vassals in *capite* of the crown, as well as the vassals of single fees from a subject, were the mere knights of tenure. But the former, in respect of their holding from the crown, were to be called to take upon themselves the knighthood of honour; a condition, in which they might rise from the ranks, and be promoted to offices and command. And, as to the vassals in *capite* of the crown, who had many fees, their wealth, of itself, sufficiently distinguished them beyond the state of the mere knights of tenure. In fact, they possessed an authority over men who were of this last description; for, in proportion to their lands, were the fees they gave out, and the knights they commanded.

By the tenure of knight-service, the greatest part of the lands in England were holden, and that principally of the king in *capite*, till the middle of the last century; and which was created, as Sir Edward Coke expressly testifies, for a military purpose; viz. for defence of the realm by the king's own principal subjects, which was judged to be much better than to trust to hirelings or foreigners. The description here given is that of knight-service proper; which was to attend the king in his wars. There were also some other species of knight-service; so called, though improperly, because the service or render was of a free and honourable nature, and equally uncertain as to the time of rendering as that of knight-service proper, and because they were attended with similar fruits and consequences. Such was the tenure by *grand serjeanty*, *per magnum servitium*, whereby the tenant was bound, instead of serving the king generally in his wars, to do some special honorary service to the king in person; as to carry his banner, his sword, or the like; or be his butler, champion, or other officer, at his coronation.

Blackst.  
Comments

(A) "The terms *knight* and *chivalier*, (Dr Stuart observes), denoted both the knight of honour and knight of tenure; "View of Soc. and chivalry was used to express both *knighthood* and *knight-service*. Hence, it has proceeded, that these persons and *chivalry* in these rates have been confounded. Yet the marks of their difference are so strong and pointed, that one must wonder that writers should mistake them. It is not, however, mean and common compilers only who have been deceived. Sir Edward Coke, notwithstanding his distinguishing head, is of this number. When estimating the value of the knight's fee at L. 20 *per annum*, he appeals to the statute *de militibus*, an. 1. Ed. II. and, by the force of his illustration, he conceives, that the knights alluded to there, were the same with the possessors of knight's fees: and they, no doubt, had knight's fees; but a knight's fee might be enjoyed not only by the tenants in *capite* of the crown, but by the tenants of a vassal, or by the tenants of a sub-vassal. Now, to these the statute makes no allusion. It did not mean to annex knighthood to every land-holder in the kingdom who had a knight's fee; but to encourage arms, by requiring the tenants in *capite* of the crown to take to them the dignity. He thus confounds *knighthood* and the *knight's fee*. COKE on Littleton, p. 69.

"If I am not deceived, Sir William Blackstone has fallen into the same mistake, and has added to it. Speaking of the knights of honour, or the *equites aurati* from the gilt spurs they wore, he thus expresses himself: 'They are also called, in our law, *milites*, because they formed a part, or indeed the whole, of the royal army, in virtue of their feudal tenures; one condition of which was, that every one who held a knight's fee (which in Henry II.'s time amounted to L. 20 *per annum*), was obliged to be knighted, and attend the king in his wars, or fined for his non-compliance. The exertion of this prerogative, as an expedient to raise money, in the reign of Charles I. gave great offence, though warranted by law and the recent example of queen Elizabeth: but it was, at the reformation, together with all other military branches of the feudal law, abolished; and this kind of knighthood has, since that time, fallen into great disrepute.' Book I. ch. 12.

"After what has been said, I need hardly observe, that this learned and able writer has confounded the knight of honour and the knight of tenure; and that the requisition to take knighthood was not made to every possessor of a knight's fee, but to the tenants of knight's fees held in *capite* of the crown, who had merely a sufficiency to maintain the dignity, and were thence disposed not to take it. The idea that the whole force of the royal army consisted of knights of honour, or dubbed knights, is so extraordinary a circumstance, that it might have shown, of itself, to this eminent writer, the source of his error. Had every soldier in the feudal army received the investiture of arms; could he wear a seal, surpass in silk and dress, use ensigns-armorial, and enjoy all the other privileges of knighthood? But, while I hazard these remarks, my reader will observe, that it is with the greatest deference I dissent from Sir William Blackstone, whose abilities are the object of a most general and deserved admiration." [N. B. The reader will please to advert, that this error has been copied by us from that author, under the article *Knight-BACHELOR*.]

tion. It was, in most other respects, like knight-service; only he was not bound to pay aid, or escuage; and, when tenant by knight-service paid five pounds for a relief on every knight's fee, tenant by grand-serjeanty paid one year's value of his land, were it much or little. Tenure by *cottage*, which was to wind a horn when the Scots or other enemies entered the land, in order to warn the king's subjects, was (like other services of the same nature) a species of grand-serjeanty.

These services, both of chivalry and grand-serjeanty, were all personal, and uncertain as to their quantity or duration. But, the personal attendance in knight-service growing troublesome and inconvenient in many respects, the tenants found means of compounding for it; by first sending others in their stead, and in process of time making a pecuniary satisfaction to the lords in lieu of it. This pecuniary satisfaction at last came to be levied by assessments, at so much for every knight's fee; and therefore this kind of tenure was called *scutagium* in Latin, or *servitium scuti*; *scutum* being then a well-known denomination of money: and in like manner it was called, in our Norman French, *escuage*; being indeed a pecuniary, instead of a military, service. The first time this appears to have been taken was in the 5 Hen. II. on account of his expedition to Toulouse; but it soon came to be so universal, that personal attendance fell quite into disuse. Hence we find in our ancient histories, that, from this period, when our kings went to war, they levied scutages on their tenants, that is, on all the landholders of the kingdom, to defray their expences, and to hire troops: and these assessments, in the time of Henry II. seem to have been made arbitrarily, and at the king's pleasure. Which prerogative being greatly abused by his successors, it became matter of national clamour; and king John was obliged to consent, by his *magna carta*, that no scutage should be imposed without consent of parliament. But this clause was omitted in his son Henry III.'s charter; where we only find, that scutages or escuage should be taken as they were used to be taken in the time of Henry II.; that is, in a reasonable and moderate manner. Yet afterwards, by statute 25 Edw. I. c. 5. & 6. and many subsequent statutes, it was enacted, that the king should take no aids or taxes but by the common assent of the realm. Hence it is held in our old books, that escuage or scutage could not be levied but by consent of parliament; such scutages being indeed the groundwork of all succeeding subsidies, and the land-tax of later times.

Since, therefore, escuage differed from knight-service in nothing but as a compensation differs from actual service, knight-service is frequently confounded with it. And thus Littleton must be understood, when he tells us, that tenant by homage, fealty, and escuage, was tenant by knight-service: that is, that this tenure (being subservient to the military policy of the nation) was respected as a tenure in chivalry. But as the actual service was uncertain, and depended upon emergencies, so it was necessary that this pecuniary compensation should be equally uncertain, and depend on the assessments of the legislature suited to those emergencies. For had the escuage been a settled inviolable sum, payable at certain times, it had been neither more nor less than a mere pecuniary rent; and the te-

nure, instead of knight-service, would have then been of another kind, called *socage*.

By the degenerating of knight-service, or personal military duty, into escuage, or pecuniary assessments, all the advantages (either promised or real) of the feudal constitutions were destroyed, and nothing but the hardships remained. Instead of forming a national militia composed of barons, knights, and gentlemen, bound by their interest, their honour, and their oaths, to defend their king and country, the whole of this system of tenures now tended to nothing else but a wretched means of raising money to pay an army of occasional mercenaries. In the mean time the families of all our nobility and gentry groaned under the intolerable burdens (in consequence of the fiction adopted after the conquest) were introduced and laid upon them by the subtlety and finess of the Norman lawyers. For, besides the scutages to which they were liable in defect of personal attendance, which, however, were assessed by themselves in parliament, they might be called upon by the king or lord paramount for *aids*, whenever his eldest son was to be knighted, or his eldest daughter married; not to forget the ransom of his own person. The heir, on the death of his ancestor, if of full age, was plundered of the first emoluments arising from his inheritance, by way of *relief* and *primer seisin*; and, if under age, of the whole of his estate during infancy. And then, as Sir Thomas Smith very feelingly complains, "when he came to his own, after he was out of *wardship*, his woods decayed, houses fallen down, stock wasted and gone, lands let forth and ploughed to be barren," to make amends, he was yet to pay half a year's profits as a fine for suing out his *livery*; and also the price or value of his *marriage*, if he refused such wife as his lord and guardian had bartered for, and imposed upon him; or twice that value, if he married another woman. Add to this, the untimely and expensive honour of *knighthood*, to make his poverty more completely splendid. And when, by these deductions, his fortune was so shattered and ruined, that perhaps he was obliged to sell his patrimony, he had not even that poor privilege allowed him, without paying an exorbitant fine for a *licence of alienation*.

A slavery so complicated, and so extensive as this, called aloud for a remedy in a nation that boasted of her freedom. Palliatives were from time to time applied by successive acts of parliament, which assuaged some temporary grievances. Till at length the humanity of king James I. consented, for a proper equivalent, to abolish them all; though the plan then proceeded not to effect; in like manner as he had formed a scheme, and began to put it in execution, for removing the feudal grievance of heritable jurisdictions in Scotland, which has since been pursued and effected by the statute 20 Geo. II. c. 43. King James's plan for exchanging our military tenures seems to have been nearly the same as that which has been since pursued; only with this difference, that by way of compensation for the loss which the crown and other lords would sustain, an annual fee-farm rent should be settled and inseparably annexed to the crown, and assured to the inferior lords, payable out of every knight's fee within their respective feignories. An expedient, seemingly much better than the hereditary excise which

Knight  
||  
Knolles.

which was afterwards made the principal equivalent for these concessions. For at length the military tenures, with all their heavy appendages, were destroyed at one blow by the statute 12 Car. II. c. 24. which enacts, "that the court of ward or liveries, and all wardships, liveries, primer feifins, and ousterleimains, values and forfeitures of marriages, by reason of any tenure of the king or others, be totally taken away. And that all fines for alienations, tenures by homage, knights-service, and escuage, and also aids for marrying the daughter or knightening the son, and all tenures of the king *in capite*, be likewise taken away. And that all sorts of tenures, held of the king or others, be turned into free and common socage; save only tenures in frankalmoin, copyholds, and the honorary services (without the slavish part) of grandfeignity." A statute, which was a greater acquisition to the civil property of this kingdom than even *magna carta* itself: since that only pruned the luxuriances that had grown out of the military tenures, and thereby preserved them in vigour; but the statute of king Charles extirpated the whole, and demolished both root and branches.

**KNIGHTS-ERRANT.** During the prevalence of chivalry, the ardour of redressing wrongs seized many knights so powerfully, that, attended by esquires, they wandered about in search of objects whose misfortunes and misery required their assistance and succour. And, as ladies engaged more particularly their attention, the relief of unfortunate damsels was the achievement they most courted. This was the rise of knights-errant, whose adventures produced romance. These were originally told as they happened. But the love of the marvellous came to interfere; fancy was indulged in her wildest exaggerations, and poetry gave her charms to the most monstrous fictions, and to scenes the most unnatural and gigantic. See **KNIGHT**.

**KNIGHT-Bachelor.** See **BACHELOR**.

**KNIGHTS of the Shire, or KNIGHTS of Parliament;** are two gentlemen of worth, chosen on the king's writ *in pleno comitatu*, by such of the freeholders of every county as can expend 40 *s. per ann.* to represent such county in parliament.

These, when every man who held a knights-fee *in capite* of the crown was customarily constrained to be a knight, were of necessity to be *milites gladio cincti*, for so the writ runs to this day; but now custom admits esquires to be chosen to this office.

They must have at least 500 *l. per ann.* and their expenses are to be defrayed by the county, tho' this be seldom, now, required.

**KNIGHT-Marshal,** an officer in the king's household, who has jurisdiction and cognizance of any transgression within the king's household and verge; as also of contracts made there, whereof one of the house is party.

**KNIGHTS,** in a ship, two short thick pieces of wood, commonly carved like a man's head, having four shivers in each, three for the baylards, and one for the top run in: one of them stands fast bolted on the beams abaft the foremast, and is therefore called the *fore-knight*; and the other, standing abaft the mainmast, is called the *main-knight*.

**KNOLLES (Richard),** was born in Northampton-

shire, about the middle of the 16th century, and educated at Oxford, after which he was appointed master of the free-school at Sandwich in Kent. He composed *Grammaticæ Latine, Græcæ, et Hebræicæ, compendium, cum radicibus*, London 1606; and sent a great number of well-grounded scholars to the universities. He also spent 12 years in compiling a history of the Turks; which was first printed in 1610, and by which he has perpetuated his name. In the later editions it is called, "The general history of the Turks, from the first beginning of that nation, to the rising of the Ottoman family, &c." He died in 1610, and this history has been since continued by several hands: the best continuation is that by Paul Ricaut consul at Smyrna, folio, London 1680. Knolles wrote also, "The lives and conquests of the Ottoman kings and emperors, to the year 1610; which was not printed till after his death in 1621, to which time it was continued by another hand; and lastly, "A brief discourse of the greatness of the Turkish empire, and wherein the greatness of the strength thereof consisteth, &c."

**KNOT,** a part of a tree, from which shoots out branches, roots, or even fruit. The use of the knots is, to strengthen the stem; they serve also as searces, to filtrate, purify, and refine the juices raised up for the nourishment of the plant.

**KNOTS of a Rope,** among seamen, are distinguished into three kinds, viz. whole-knot, that made so with the lays of a rope that it cannot slip, serving for sheets, tacks, and stoppers: bow-line knot, that so firmly made, and fastened to the cringles of the sails, that they must break or the sail split before it slips: and sheep-shank knot, that made by shortening a rope without cutting it, which may be presently loosened, and the rope not the worse for it.

**KNOT of the Log-line,** at sea, are the divisions of it. See the article **LOG**.

**KNOT,** in ornithology. See **TRINGA**.

**KNOT-Grass,** or bistort. See **POLYGONUM**.

**KNOT (Edward),** born in Northumberland in England, entered among the Jesuits at the age of 26, being already in priest's orders. This happened in the year 1606. He taught a long time at Rome in the English college; and was afterwards appointed sub-provincial of the college of England, and was sent provincial thither. He was twice honoured with that employment. He was present as provincial at the general assembly of the order of the Jesuits held at Rome in 1646, and was chosen definitor. He died in 1696. He published several pieces; among the rest, "Mercy and Truth, or Charity maintained by the Catholics;" against Dr Potter, who had charged the church of Rome with wanting charity, because she asserts that a man cannot be saved in the protestant communion.

**KNOWLEDGE,** is defined by Mr Locke to be the perception of the connection and agreement or disagreement and repugnancy of our ideas. See **METAPHYSICS**, n<sup>o</sup> 163—231; and **LOGIC**, n<sup>o</sup> 27—29. 53.

**KNOX (John),** the hero of the reformation in Scotland, was born in 1505, at Gifford near Haddington in East Lothian; and educated at the university of St Andrews, where he took a degree in arts, and commenced teacher very early in life. At this time the new religion of Martin Luther was but little known

Knolles  
||  
Knox.

Knox.

known in Scotland; Mr Knox therefore at first was a zealous Roman-catholic: but, attending the sermons of a certain black-friar, named *Guilliamus*, he began to waver in his opinions; and afterwards conversing with the famous Wihart, who, in 1544, came to Scotland with the commissioners sent by Henry VIII. he renounced the Romish religion, and became a zealous reformer. Being appointed tutor to the sons of the lairds of Ormiston and Langniddery, he began to instruct them in the principles of the Protestant religion; and, on that account, was so violently persecuted by the bishop of St Andrew's, that, with his two pupils, he was obliged, in the year 1547, to take shelter in the castle of that place. But the castle was besieged and taken by 21 French galleys. He continued a prisoner on board a galley two years, namely, till the latter end of the year 1549; when being set at liberty, he landed in England, and, having obtained a licence, was appointed preacher, first at Berwick, and afterwards at Newcastle. Strype conjectures, that in 1552 he was appointed chaplain to Edward VI. He certainly obtained an annual pension of 40*l.* and was offered the living of All-hallows in London; which he refused, not choosing to conform to the liturgy.

Soon after the accession of queen Mary, he retired to Geneva; whence, at the command of John Calvin, he removed to Francfort, where he preached to the exiles: but, a difference arising on account of his refusing to read the English liturgy, he went back to Geneva; and from thence, in 1555, returned to Scotland, where the reformation had made considerable progress during his absence. He now travelled from place to place, preaching and exhorting the people with unremitting zeal and resolution. About this time, (1556), he wrote a letter to the queen regent, earnestly intreating her to hear the Protestant doctrine; which letter she treated with contempt. In the same year the English Calvinists at Geneva invited Mr Knox to reside among them. He accepted their invitation. Immediately after his departure from Scotland, the bishops summoned him to appear, and, he not appearing, condemned him to death for heresy, and burnt his effigy at the cross of Edinburgh.

Our reformer continued abroad till the year 1559, during which time he published his "First blast against the monstrous regiment of women." Being now returned to Scotland, he resumed the great work of reformation with his usual ardour, and was appointed minister at Edinburgh. In 1561, queen Mary arrived from France. She, it is well known, was bigotted to the religion in which she had been educated, and, on that account, was exposed to continual insults from her reformed subjects. Mr Knox himself frequently insulted her from the pulpit; and, when admitted to her presence, regardless of her sex, her beauty, and her high rank, behaved to her with a most unjustifiable freedom. In the year 1571 our reformer was obliged to leave Edinburgh, on account of the confusion and danger from the opposition to the earl of Lenox, then regent; but he returned the following year, and resumed his pastoral functions. He died at Edinburgh in November 1572, and was buried in the church-yard of St Giles's in that city.—His history of the Reformation was printed, with his

other works, at Edinburgh, in 1584, 1586, 1644, 1732. He published many other pieces; and several more are preferred in Calderwood's history of the Church of Scotland. He left also a considerable number of manuscripts, which in 1732 were in the possession of Mr Woodrow, minister of Eastwood.

As to his character, it is easily understood, notwithstanding the extreme diffimilitude of the two portraits drawn by Popish and Calvinistical pencil. According to the first, he was a devil; in the ideas of the latter, an angel. He was certainly neither. The following character is drawn by Dr Robertson. "Zeal, intrepidity, disinterestedness, were virtues that he possessed in an eminent degree. He was acquainted too with the learning cultivated in that age; and excelled in that species of eloquence which is calculated to rouse and to inflame. His maxims, however, were often too severe, and the impetuosity of his temper excessive. Rigid and uncompromising, he shewed no indulgence to the infirmities of others. Regardless of the distinctions of rank and character, he uttered his admonitions with an acrimony and vehemence, more apt to irritate than to reclaim; and this often betrayed him into indecent expressions, with respect to queen Mary's person and conduct. Those very qualities, however, which now render his character less amiable, fitted him to be the instrument of Providence for advancing the reformation among a fierce people, and enabled him to face dangers, and to surmount opposition, from which a person of a more gentle spirit, would have been apt to shrink back. By an unwearied application to study and to business, as well as by the frequency and fervour of his public discourses, he had worn out a constitution naturally strong. During a lingering illness, he discovered the utmost fortitude; and met the approach of death with a magnanimity inseparable from his character. He was constantly employed in acts of devotion, and comforted himself with those prospects of immortality, which not only preserve good men from desponding, but fill them with exultation in their last moments. The earl of Morton, who was present at his funeral, pronounced his eulogium in a few words, the more honourable for Knox, as they came from one whom he had often censured with peculiar severity: "Here lies he who never feared the face of man."

KNUTZEN (Matthias), a native of Holstein, the only person on record who openly professed and taught atheism. It is said he had about 1000 disciples in different parts of Germany. They were called *Conscienciaries*, because they asserted there is no other God, no other religion, no other lawful magistracy, but conscience, which teaches every man the three fundamental principles of the law of nature;—To hurt nobody, to live honestly, and to give every one his due. Several copies of a letter of his from Rome were spread abroad, containing the substance of his system. It is to be found entire in the last edition of Micraelius.

KOEMPFER (Engelbert), was born in 1651 at Lengow in Westphalia. After studying in several towns, he went to Dantzick, where he gave the first public specimen of his proficiency by a dissertation *De majestatis divisione*. He then went to Thorn; and from thence to the university of Cracow, where he took

his

Knox.  
Koempfer

Koenig,  
Konig.

his degree of doctor in philosophy; after which he went to Königsberg in Prussia, and staid there four years. He next travelled into Sweden, where he soon began to make a figure, and was appointed secretary of the embassy to the sophi of Persia. He set out from Stockholm with the presents for that emperor; and went through Aaland, Finland, and Ingermanland, to Narva, where he met Mr Fabricius the ambassador, who had been ordered to take Moscow in his way. The ambassador having ended his negotiations at the Russian court, set out for Persia. During their stay, two years, at Isphahan, Dr Kœmpfer, whose curious and inquisitive disposition suffered nothing to escape him unobserved, made all the advantages possible of so long an abode in the capital of the Persian empire. The ambassador, toward the close of 1685, preparing to return into Europe, Dr Kœmpfer chose rather to enter into the service of the Dutch East-India company, in quality of chief surgeon to the fleet, then cruising in the Persian gulph. He went aboard the fleet, which, after touching at many Dutch settlements, came to Batavia in September 1689. Dr Kœmpfer here applied himself chiefly to natural history. Hence he set out for Japan, in quality of physician to the embassy which the Dutch East-India company sends once a-year to the Japonese court. He quitted Japan to return to Europe in 1692. In 1694 he took his degree of doctor of physic at Leyden; on which occasion he communicated, in what are called *inaugural theses*, ten very singular and curious observations made by him in foreign countries. He intended to digest his memoirs into proper order; but was prevented, by being made physician to the count de Lippe. He died in 1716. His principal works are, 1. *Amenitates Exoticae*, in quarto; a work which includes many curious and useful particulars in relation to the civil and natural history of the countries through which he passed. 2. *Herbarium Ultra-Gangeticum*. 3. The history of Japan in German, which is very curious and much esteemed; and for which the public is indebted to the late Sir Hans Sloane, who purchased, for a considerable sum of money, all our author's curiosities, both natural and artificial, as likewise all his drawings and manuscript memoirs, and prevailed with the late learned Dr Scheuchzer to translate the Japanese history into English.

KOENIG (Samuel), a learned philosopher and mathematician, was professor of philosophy at Franeker, and afterwards at the Hague, where he became librarian to the Stadtholder, and died there in 1757. He wrote several works which are esteemed.

KONIG (George Matthias), a learned German, born at Altorf in Franconia, in 1616. He became professor of poetry and of the Greek tongue there, and librarian to the university; in which last office he succeeded his father. He gave several public specimens of his learning; but is principally known for a biographical dictionary, intitled, *Bibliotheca vetus et nova*, 4to, Altorf, 1674: which, though it is very defective, is useful to biographers. He died in 1699.

KONIG (Emanuel), a learned physician of Basil, born in that city in 1658, whose medicinal works were so esteemed in Switzerland, that he was considered as a second Avicenna. He died at Basil in 1731.

VOL. VI.

KONINGSBERG, a town of Poland, and capital of Regal Prussia, with an university, and a magnificent palace, in which is a hall 274 feet long and 59 broad, without pillars to support it, and a handsome library. It contains 3800 houses, and 40,000 inhabitants; and the present king of Prussia received homage of the inhabitants in 1740. The town-house, the exchange, and the cathedral church, are all very fine structures. The tower of the castle is exceeding high; and has 284 steps to go to the top, from whence there is a very distant prospect. There are 18 churches in all; of which 14 belong to the Lutherans, 3 to the Calvinists, and one to the Papists. It is seated on the river Preget, near the sea, E. Long. 21. 35. N. Lat. 54. 42.

KORAN, or ALCORAN. See ALCORAN and MAHOMETANISM.

KOOS. See DOLICHOS.

KOS, in Jewish antiquity, a measure of capacity, containing about four cubic inches: this was the cup of blessing out of which they drank when they gave thanks after solemn meals, like that of the passover.

KOTTERUS (Christopher), was one of the three fanatics whose visions were published at Amsterdam in 1657, with the title of *Lux in tenebris*. He lived at Sprotta in Silesia, and his visions began in 1616. He fancied he saw an angel under the form of a man, who commanded him to go and declare to the magistrates, that, unless the people repented, the wrath of God would make dreadful havoc. The elector palatine, whom the Protestants had declared king of Bohemia, was introduced in these visions. Kotterus warned him at Breslaw in December 1620, and informed him of his commission. He went to several other places, and at last to the court of Brandenburg. As most of these predictions promised felicity to the elector Palatine, and unhappiness to his imperial Majesty, the emperor's fiscal in Silesia and Lusatia got him seized, set on the pillory, and banished the emperor's dominions. Upon this he went to Lusatia, and there lived unmolested till his death, which happened in 1647.

KOUANIN, in the Chinese language, the name of a tutelary deity of women. The Chinese make great numbers of the figures of this deity in white porcelain, and send them to all parts of the world, as well as keep them in their own houses. The figure represents a woman with a child in her arms. The women who have no children pay a sort of adoration to these images, and suppose the deity they represent to have power to make them fruitful. The statue always represents a handsome woman very modestly attired.

KOUÉ (Peter), an excellent painter in the 16th century, was born at Aloft, and was the disciple of Bernard Van Orley, who lived with Raphael. He went to Rome, and, by studying the beautiful pieces which he found there, formed an excellent taste, and became a very correct designer. On his return to his own country, he undertook the office of directing the execution of some tapestry-work after the designs of Raphael. He was afterwards persuaded by some merchants of Brussels to undertake a voyage to Constantinople; but when he came there, finding that the Turks were not allowed by their religion to draw any figure, and that there was nothing for him to do but

Königs-  
berg  
||  
Koue.

Kouli Khan, to draw designs for tapestry, he spent his time in designing the particular prospects in the neighbourhood of Constantinople, and the manner of the Turks living; of which he has left many wooden cuts, that alone suffice to give an idea of his merit. After his return from Constantinople he settled at Antwerp, where he drew several pictures for the emperor Cha. V. He was also a good architect; and, in the latter part of his life, wrote a treatise of sculpture, geometry, and perspective; and translated Vitruvius and Serliv into the Flemish tongue. He died in 1550.

KOULI KHAN (Thamas), or *Schah Nadir*, was not the son of a shepherd, as the authors of the English biographical dictionary assert; his father being chief of a branch of the tribe of Afchairs, and governor of a fortress erected by that people against the Turks. Upon his father's death, his uncle usurped his government, under the pretext of taking care of it during the minority of Kouli-Khan; or, more properly, young Nadir. Disgust at this affront made him commence adventurer. He entered into the service of Beglerberg, governor of Muschada, in the Khorasan; who, discovering in him strong marks of a military genius, promoted him to the command of a regiment of cavalry. In 1720, the Ufbeck Tartars having made an eruption into the Khorasan with 10,000 men, Beglerberg, whose whole force consisted only of 4000 horse and 2000 infantry, called a council of war, in which it was declared imprudent to face the enemy with such an inferior force; but Kouli-Khan proposed to march against the enemy, and engaged to conduct the expedition, and to be answerable for the success of it. He was accordingly made general; defeated the Tartars, and took their commander prisoner. Hossen Beglerberg received him at his return with marks of distinction: but growing jealous of his rising fame, instead of obtaining him the rank of lieutenant-general of the Khorasan, as he had promised, obtained it for another; which so exasperated Kouli-Khan, that he publicly complained of the governor's ingratitude and perfidy; who thereupon broke him, and ordered him to be punished with the bastinado so severely, that the nails of his great toes fell off. This affront occasioned his flight, and his joining a banditti of robbers, (not his stealing his father's or his neighbour's sheep). The rest of his adventures are too numerous to be inserted in this work. In 1729, he was made general of Persia by Schah Thamas, and permitted to take his name *Thamas*, and that of *Khuli*, which signifies *slave*: his title therefore was, *The slave of Thamas*; but he was ennobled by the addition of Khan. In 1739, he fomented a revolt against his master, for having made an ignominious peace with the Turks; and having the army at his command, he procured his deposition, and his own advancement to the throne. In 1739 he conquered the Mogul empire; and from this time growing as cruel as he was ambitious, he at length met with the usual fate of tyrants, being assassinated by one of his generals, in league with his nephew and successor, in 1747, aged sixty.

KRAKEN, KRAZEN, or *Krabben*, a name given by the Norwegians to a sea-monster of a most enormous size, the existence of which seems to be after all rather dubious. Erich Pontoppidan, bishop of Bergen,

in his Natural History of Norway, gives the most distinct account of this creature; which, according to him, is of the polypus kind. He is of opinion, that it is mentioned by Pliny and some other ancient authors, and will have it to be the remora so much spoken of by the ancient writers. This last, however, is now pretty certainly known to be a mistake; for the remora has been observed in the Mediterranean, and found to be a creature vastly inferior in size to the Kraken. See REMORA. The bishop's evidences for the existence of the Kraken, and his conjectures about it, we shall give in his own words.

"Our fishermen," says he, "unanimously affirm, and without the least variation in their accounts, that when they row out several miles to sea, particularly in the hot summer-days, and by their situation (which they know by taking a view of certain points of land) expect to find 80 or 100 fathoms water, it often happens that they do not find above 20 or 30, and sometimes less. At these places they generally find the greatest plenty of fish, especially cod and ling. Their lines, they say, are no sooner out, than they may draw them up with the hooks all full of fish; by this they judge that the kraken is at the bottom. They say this creature causes those unnatural shallows mentioned above, and prevents their founding. These the fishermen are always glad to find, looking upon them as a means of their taking abundance of fish. There are sometimes twenty boats or more got together, and throwing out their lines at a moderate distance from each other; and the only thing they then have to observe is, whether the depth continues the same, which they know by their lines, or whether it grows shallower, by their seeming to have less water. If this last be the case, they find that the kraken is raising himself nearer the surface, and then it is not time for them to stay any longer; they immediately leave off fishing, take to their oars, and get away as fast as they can. When they have reached the usual depth of the place, and find themselves out of danger, they lie upon their oars, and in a few minutes after they see this enormous monster come up to the surface of the water; he there shows himself sufficiently, though his whole body does not appear, which, in all likelihood, no human eye ever beheld, (excepting the young of this species, which shall afterwards be spoken of); its back, or upper part, which seems to be in appearance about an English mile and an half in circumference, (some say more, but I choose the least for greater certainty), looks at first like a number of small islands, surrounded with something that floats and fluctuates like sea-weeds. Here and there a larger rising is observed like sand-banks, on which various kinds of small fishes are seen continually leaping about till they roll off into the water from the sides of it; at last several bright points or horns appear, which grow thicker and thicker the higher they rise above the surface of the water, and sometimes they stand up as high and as large as the masts of middle-sized vessels.

"It seems these are the creature's arms; and, it is said, if they were to lay hold of the largest man of war, they would pull it down to the bottom. After this monster has been on the surface of the water a short time, it begins slowly to sink again, and then the

Kraken. the danger is as great as before; because the motion of his sinking caules such a swell in the sea, and such an eddy or whirlpool, that it draws every thing down with it.

"As this enormous sea-animal, in all probability, may be reckoned of the polype or the star-fish kind, it seems, that the parts which are seen rising at its pleasure, and are called *arms*, are properly the tentacula, or feeling instruments, called *horns* as well as *arms*. With these they move themselves, and likewise gather in their food.

"Besides these, for this last purpose the great Creator has also given this creature a strong and peculiar scent, which it can emit at certain times, and by means of which it beguiles and draws other fish to come in heaps about it. This animal has another strange property, known by the experience of a great many old fishermen. They observe, that for some months the kraken, or krabben, is continually eating, and in other months he always voids his excrements. During this evacuation, the surface of the water is coloured with the excrement, and appears quite thick and turbid. This muddiness is said to be so very agreeable to the smell or taste of other fishes, or to both, that they gather together from all parts to it, and keep for that purpose directly over the kraken: he then opens his arms or horns, seizes and swallows his welcome guests, and converts them, after the due time, by digestion, into a bait for other fish of the same kind. I relate what is affirmed by many; but I cannot give so certain assurances of this particular, as I can of the existence of this surprising creature; though I do not find any thing in it absolutely contrary to nature. As we can hardly expect an opportunity to examine this enormous sea-animal alive, I am the more concerned that nobody embraced that opportunity which, according to the following account, once did, and perhaps never more may offer, of seeing it entire when dead. The reverend Mr Friis, consistorial assessor, minister of Bodoen in Nordland, and vicar of the college for promoting Christian knowledge, gave me, at the latter end of last year, when he was at Bergen, this relation; which I deliver again on his credit.

"In the year 1680, a krake, (perhaps a young and careless one), came into the water that runs between the rocks and cliffs in the parish of Alstahoug; tho' the general custom of that creature is to keep always several leagues from land, and therefore of course they must die there. It happened that its extended long arms, or antennæ, which this creature seems to use like the snail, in turning about, caught hold of some trees standing near the water, which might easily have been torn up by the roots; but besides this, as it was found afterwards, he entangled himself in some openings or clefts in the rocks, and therein stuck so fast, and hung so unfortunately, that he could not work himself out, but perished and putrified on the spot. The carcase, which was a long while decaying, and filled great part of that narrow channel, made it almost impassable by its intolerable stench.

"The kraken has never been known to do any great harm, except they have taken away the lives of those who consequently could not bring the tidings. I have never heard but one instance mentioned, which hap-

pened a few years ago near Fridrichstad, in the diocese of Aggerhuys. They say that two fishermen accidentally, and to their great surprise, fell into such a spot on the water as has been before described, full of a thick slime, almost like a morass. They immediately strove to get out of this place: but they had not time to turn quick enough to save themselves from one of the kraken's horns; which crushed the head of the boat so, that it was with great difficulty they saved their lives on the wreck, though the weather was as calm as possible; for these monsters never appear at other times.

"Mr Luke Debes, in his description of Faroe, speaks of certain islands which suddenly appear, and as suddenly vanish. This was a thing nobody could comprehend; so that one ought not to wonder at the common people, and even those that were a degree above them, for looking upon those moving islands to be inhabited by evil spirits, which appeared sometimes in such places where the seamen, by daily experience, knew very well that there was no such thing as a rock, much less an island; but, however, they often found something at sea which had the appearance of land, and consequently were confounded, made false reckonings, and were taken out of their course, and brought into the greatest inconveniences. Many sea-faring people give accounts of such appearances of land, and their suddenly vanishing away, and particularly here in the north sea. These islands, in the boisterous ocean, cannot be imagined to be of the nature of those real floating islands that are seen on fresh and stagnated waters, and which I have observed are found here in Norway and in other places. These could not possibly hold or stand against the violence of the waves in the ocean, which break the largest vessels; and therefore our sailors have concluded this delusion could come from no other than that great deceiver the devil. But, according to the laws of truth, we ought not to charge this apostate spirit without a cause. I rather think that this devil, who so suddenly makes and unmakes these floating islands, is nothing else but the kraken, which some sea-faring people call *Soc-draulen*, that is, *Soc-trolden*, "sea-mischief."

KRANTZIUS (Albertus), a native of Hamburg, and a famous historian, who travelled over several parts of Europe, and was made rector of the university of Rostoch in 1482. He went from thence to Hamburg in 1508, where he was elected dean of the chapter in the cathedral. He did many good services to that church and city; and was so famed for his abilities and prudence, that John king of Denmark, and Frederic duke of Holstein, did not scruple to make him umpire in a dispute they had with the Dittmarsh. He wrote several good historical works; the most considerable of which is an Ecclesiastical History of Saxony, entitled *Metropolis*, in folio; the best edition is that of Francfort. He died in 1517.

KUHLMAN (Quirinus), one of the visionaries of the 17th century, born at Breslaw in Silesia in 1651. He gave great hopes by his early progress in his studies; but it was interrupted by a sickness, under which he laboured at 18 years of age. He was thought to be dead on the third day of his illness. But that day he had terrible visions. Two days after, he had

Krantzius,  
Kuhlman.

more. He had no longer any taste for profane learning; and would have no instructor but the Holy Ghost. At 19 he left his country and went to travel. He met in Holland with Böhmen's works, of which he had never heard before. The reading of them was like oil thrown into the fire: he was surprised that Böhmen should have prophesied of things, of which nobody but Kuhlman himself had the least knowledge. There was at that time in Holland one John Rothe, who undertook to prophecy. Our author wrote to him in the most humble manner, styling him *a man of God, John III. and the son of Zacharias*. He wandered a long time in England, France, and the East; and at last was burnt in Muscovy 1680, on account of some predictions that were actually seditious. There was a picture of him with so many titles, that the monarchs of the East never assumed more. The magnificent promises and vast designs of this fanatic may be seen in Morhof's *Polyhistor*. He wrote several works filled with fanaticism; the principal of which is intitled *Prodromus quinquennii mirabilis*, printed at Leyden in 1674.

KUHNUS (Joschim), a learned German critic, was born at Griplwalde in Pomerania, in 1647. He was, in 1669, made principal of the college at Oettingen in Swabia; in 1676, he was elected Greek professor in the principal college at Strasburg; and after acquitting himself with honour for ten years in this capacity, was made Greek and Hebrew professor in the same university. His uncommon skill in the Greek language drew a great number of scholars about him, from very distant places; and he published some classic authors with very learned notes both explanatory and critical. He died in 1697.

KUNCKEL (John), a celebrated Saxon chemist, born in the duchy of Sleswick, in 1630. He became chemist to the elector of Saxony, the elector of Brandenburg, and Charles II. king of Sweden, who gave him the title of *counsellor in metals*, and letters of nobility, with the surname of *Louvenstein*. He employed 50 years in chemistry; in which, by the help of the furnace of a glass-house, which he had under his care, he made several excellent discoveries, particularly of the phosphorus of urine. He died in Swe-

den, in 1702; and left several works, some in German, and others in Latin: among which, that intitled *Observationes Chemicæ*, and the "Art of making Glass," printed at Paris in 1752, are the most esteemed.

KUSTER (Ludolf), a very learned writer in the 18th century, was born at Blomberg in Westphalia. When very young, he was, upon the recommendation of baron Spanheim, appointed tutor to the two sons of the count de Schwerin, prime minister of the king of Prussia, who, upon our author's quitting that station, procured him a pension of 400 livres. He was promised a professorship in the university of Joachim; and till this should be vacant, being then but 25, he resolved to travel. He read lectures at Utrecht; went to England; and from thence to France, where he collated Suidas with three MSS. in the king's library, which furnished him with a great many fragments that had never been published. He was honoured with the degree of doctor by the university of Cambridge, which made him several advantageous offers to continue there: but he was called to Berlin, where he was installed in the professorship promised him. Afterward he went to Antwerp; and being brought over to the Catholic religion, he abjured that of the Protestants. The king of France rewarded him with a pension, and ordered him to be admitted supernumerary associate of the academy of inscriptions. But he did not enjoy this new settlement long; for he died in 1716, aged 46. He was a great master of the Latin tongue, and wrote well in it; but his chief excellence was his skill in the Greek language, to which he almost entirely devoted himself. He wrote many works; the principal of which are, *Historia critica Homeri*. 2. *Jamblicus de vita Pythagoræ*. 3. An excellent edition of Suidas, in Greek and Latin, three volumes, folio. 4. An edition of Aristophanes, in Greek and Latin, folio. 5. A new Greek edition of the New Testament, with Dr Mills's Variations, in folio.

KUTUCHTU, among the Calmuc Tartars, the name of their high-priest or sovereign pontiff; formerly only the deputy of the delai-lama or high-priest of the Tartars, but at present independent on him.

## L.

**L**, A semi-vowel, or liquid, making the eleventh letter of the alphabet.

It was derived from the old Hebrew Lamed, or Greek Lambda. It is founded by intercepting the breath between the top of the tongue and forepart of the palate, with the mouth open; and makes a sweet sound, with something of an aspiration; and therefore the Britons and Spaniards usually doubled it, or added an *h* to it, in the beginning of words, as in *llan*, or *llan*, a temple, founding nearly like *ll*, &c. In English words of one syllable it is doubled at the end, as

*tell*, *bell*, *knell*, &c. but in words of more syllables than one it is single at the end, as *evil*, *general*, *constitutional*, &c. It is placed after most of the consonants in the beginning of words and syllables, as *black*, *glare*, *ad-le*, *ea-gle*, &c. but before none. Its sound is clear in *Abel*, but obscure in *able*, &c.

As a numeral letter, *L* denotes 50; and with a dash over it, thus, *L̄*, 50000. Used as an abbreviation, *L* stands for *Lucius*; and *L. L. S.* for a lettersee. See *SESTERCE*.

*LA*, the syllable by which Guido denotes the last sound

Labadie. found of each hexachord: if it begins in C, it answers to our A; if in G, to E; and if in F, to D.

LABADIE (John), a famous French enthusiast, son of John Charles Labadie, governor of Bourges, and gentleman in ordinary of the bed-chamber to the French king, was born in 1610. He entered young into the Jesuits college at Bourdeaux; which, by his own account, he afterwards quitted, but by other accounts was expelled for his peculiar notions, and for hypocrisy. He became a popular preacher; but being repeatedly detected in working upon female devotees with spiritual instructions for carnal purposes, his loss of character among the Catholics drove him among the Protestants. A reformed Jesuit being thought a great acquisition, he was precipitately accepted as a pastor at Montauban, where he officiated for eight years; but, attempting the chastity of a young lady whom he could not convert to his purpose, and quarrelling with the Catholic priest about the right of interring a dead body, he was at length banished that place. The story of his affair with the lady, as related by Mr Bayle, may here be given as a specimen of his ministry. Having directed this damsel to the spiritual life, which he made to consist in internal recollection and mental prayer, he gave her out a certain point of meditation; and having strongly recommended it to her to apply herself entirely for some hours to such an important object, he went up to her when he believed her to be at the height of her recollection, and put his hand into her breast. She gave him a hasty repulse, expressed a great deal of surprize at the proceeding, and was even preparing to rebuke him, when he, without being in the least disconcerted, and with a devout air, prevented her thus: "I see plainly, my child, that you are at a great distance from perfection; acknowledge your weakness with an humble spirit; ask forgiveness of God for your having given so little attention to the mysteries upon which you ought to have meditated. Had you bestowed all necessary attention upon these things, you would not have been sensible of what was doing about your breast. But you are so much attached to sense, so little concentrated with the Godhead, that you were not a moment in discovering that I had touched you. I wanted to try whether your fervency in prayer had raised you above the material world, and united you with the Sovereign Being, the living source of immortality and of a spiritual state; and I see to my great grief, that you have made very small progress, and that you only creep on the ground: may this, my child, make you ashamed, and for the future move you to perform the duties of mental prayer better than you have hitherto done." The young lady, who had as much good-sense as virtue, was no less provoked at these words, than at the bold actions of her ghostly instructor; and could never afterwards bear the name of such an holy father.

Labadie being driven out of Montauban, went to seek an asylum at Orange: but not finding himself so safe there as he imagined, he withdrew privately to Geneva, where he imposed on the people by his devout preaching and carriage; and from thence was invited to Middleburg, where his spirituality made him and his followers considered as so many saints, distinguished by the name of *Labadists*. They in-

creased so much, that he excited the attention of the other churches, whose authority he disputed, till he was formally deposed by the synod of Dort. Instead of obeying, he procured a tumultuous support from a crowd of his devotees; and at length formed a little settlement between Utrecht and Amsterdam, where he erected a printing-press, which sent forth many of his works. Here he was betrayed by some deserters, who exposed his private life, and informed the public of his familiarities with his female disciples, under pretence of uniting them more particularly to God; and was finally obliged to retire to Altena in Holstein, where he died in 1674.

LABADISTS, a sect of religionists in the 17th century, followers of the opinions of John Labadie, of whom an account is given in the preceding article. Some of their opinions were, 1. That God could, and did deceive men. 2. That, in reading the Scriptures, greater attention should be paid to the internal inspiration of the Holy Spirit, than to the words of the text. 3. That baptism ought to be deferred till mature age. 4. That the good and the wicked entered equally into the old alliance, provided they descended from Abraham; but that the new admitted only spiritual men. 5. That the observation of Sunday was a matter of indifference. 6. That Christ would come and reign 1000 years on earth. 7. That the eucharist was only a commemoration of the death of Christ; and that, though the symbols were nothing in themselves, yet that Christ was spiritually received by those who partook of them in a due manner. 8. That a contemplative life was a state of grace, and of divine union during this life, the summit of perfection, &c. 9. That the man whose heart was perfectly content and calm, half enjoys God, has familiar entertainments with him, and sees all things in him. 10. That this state was to be come at by an entire self-abnegation, by the mortification of the senses and their objects, and by the exercise of mental prayer.

LABARUM, the banner or standard borne before the Roman emperors in the wars. The *labarum* consisted of a long lance, with a staff a-top, crossing it at right angles; from which hung a rich streamer, of a purple colour, adorned with precious stones. Till the time of Constantine it had an eagle painted on it; but that emperor, in lieu thereof, added a cross with a cipher expressing the name of *Jesus*.

This standard the Romans took from the Germans, Dace, Sarmatæ, Pannonians, &c. whom they had overcome. The name *labarum* was not known before the time of Constantine; but the standard itself, in the form we have described it, abating the symbols of Christianity, was used by all the preceding emperors. Some derive the word from *labor*, as if this finished their labours; some from *εὐλαβία*, "reverence, piety;" others from *λαμβάνω*, "to take;" and others from *λαβρός*, "spoils."

LABAT (John Baptiste), a celebrated traveller, of the order of St Dominic, was born at Paris, taught philosophy at Nancy, and in 1693 went to America in quality of a missionary. At his return to France in 1705, he was sent to the chapter of his order at Bologna to give an account of his mission, and staid several years in Italy. He died at Paris in 1738. His principal works are, 1. A new voyage to the American.

Labadists  
Labat.

Labbe  
||  
Label.

American islands, 6 vols. 12mo. 2. Travels in Spain and Italy, 8 vols. 12mo. 3. A new account of the western parts of Africa, 5 vols. 12mo.: Father Labat was not in Africa, and therefore was not a witness of what he relates in that work. He also published the *Chevalier des Marchais' voyage to Guinea*, in 4 vols. 12mo.; and *An historical account of the western parts of Ethiopia*, translated from the Italian of father Cavazzi, 5 vols. 12mo.

**LABBE** (Louisa), a courtesan and poetess of Lyons. Her charms were so great, that her contemporaries have lavished every kind of applause on her. She entertained at her house lords, gentlemen, and other persons of merit, with conversation, music, and the reading of good authors, with which her closet was abundantly stocked, and with the most delicious sweet-meats. She was particularly fond of learned men; who were so much in her good graces, that she preferred them before any nobleman of the highest distinction. All the compositions she left are comprized in a book, which is extremely scarce, intitled, *Ouvres de Louise Labbé, Lionnoise*, printed at Lyons in 1556; in which is, *The contest of Love and Folly*.

**LABBE** (Philip), born at Bourges in France, in 1607; professed philosophy, divinity, and the languages, with great applause; and died in 1667, aged 70. He was a laborious writer, and a good critic; and wrote, 1. *Nova Bibliotheca MS. librorum*, in 2 vols. folio. 2. *De Byzantine historie Scriptoribus*. 3. *Galenii vita*. 4. *Bibliotheca bibliothecarum*. 5. *Concordantia chronologica*, &c. He began the last edition of "The councils," and died while the 9th volume was printing; they were finished in 17 volumes, by father Cossart.

**LABDANUM**, or **LADANUM**, a resin of the softer kind, though of too firm a consistence to be ranked among the fluid ones.

There are two kinds of it kept in the shops; one usually imported in bladders, to preserve it in its genuine soft consistence, and to prevent the evaporation of its finer parts; another in rolls, much inferior to the former in purity and virtue.

*Labdanum* should be chosen soft and moist, of a strong smell, pure, very inflammable, and diffusing a fragrant smell while burning. It is a resinous juice, which exudes from a tree of the cistus-kind. See **CISTUS**.

In medicine it is used externally, to attenuate and dissolve tumours; internally, it is more rarely used, but it is greatly extolled by some against catarrhs, and in dysenteries.

**LABEL**, a long, thin brass ruler, with a small sight at one end, and a centre-hole at the other; commonly used with a tangent-line on the edge of a circumferenter, to take altitudes, &c.

**LABEL**, in law, is a narrow slip of paper, or parchment, affixed to a deed or writing, in order to hold the appending seal.—Any paper annexed by way of addition, or explication, to any will or testament, is also called a *label* or *codicil*.

**LABEL**, in heraldry, a fillet usually placed in the middle along the chief of the coat, without touching its extremities. Its breadth ought to be a ninth part of the chief. It is adorned with pendants; and when

Labial  
||  
Laboureur.

there are above three of these, the number must be specified in blazoning.

It is used on the arms of eldest sons while the father is alive, to distinguish them from the younger; and is esteemed the most honourable of all differences. See **HERALDRY**, p. 3587. col. 2.

**LABIAL** LETTERS, those pronounced chiefly by means of the lips.

**LABIATED** FLOWERS, monopetalous flowers, consisting of a narrow tube, with a wide mouth, divided into two or more.

**LABIAU**, a small town of Ducal Prussia, in a circle of the same name, seated at the mouth of the river Deime, with a strong castle, two sides of which are surrounded with water, and the other defended by a wall and ditch. E. Long. 19. 56. N. Lat. 55. 17.

**LABORATORY**, or **ELABORATORY**, the chemists work-house, or the place where they perform their operations, where the furnaces are built, their vessels kept, &c. and in general, the term *laboratory*, is applied to any place where physical experiments in pharmacy, chemistry, pyrotechny, &c. are performed.

As laboratories must be of very different kinds, according to the nature of the operations to be performed in them, it is impossible that any directions can be given which will answer for every one. Where the purposes are merely experimental, a single furnace or two of the portable kind will be sufficient. It is scarce needful to add, that shelves are necessary for holding vessels with the products of the different operations; and that it is absolutely necessary to avoid confusion and disorder, as by these means the products of the operations might be lost or mistaken for one another. Mortars, filters, levigating stones, &c. must also be procured: but from a knowledge of the methods of performing the different chemical operations will easily be derived the knowledge of a proper place to perform them in; for which, see the articles **CHEMISTRY**, **METALLURGY**, and **FURNACE**.

**LABORATORY**, in military affairs, signifies that place where all sorts of fire-works are prepared, both for actual service and for pleasure, viz. quick-matches, fuzes, portfires, grape-shot, case-shot, carcasses, hand-grenades, cartridges, shells filled and fuses fixed, wads, &c. &c.

**LABOUR**, in general, denotes a close application to work or business.—Among seamen a ship is said to be in labour, when the rolls and tumbles very much, either a-hull, under sail, or at anchor.—It is also spoke of a woman in travail or child-birth; see **MIDWIFERY**.

**LABOURER**, generally signifies one that does the most slavish and less artful part of a laborious work, as that of husbandry, masonry, &c.

**LABOUREUR** (John le), almoner to the king of France, and prior of Juvigne, was born at Montmorency near Paris in 1623. At the age of 18, he distinguished himself by publishing "A collection of the monuments of illustrious persons buried in the church of the Celestines at Paris, with their eulogies, genealogies, arms, and mottoes," &c. He afterwards published an excellent edition of *The Memoirs of Michael de Castelnau*, with several other genealogical histories; and died in 1675.—He had a brother, *Lewis le Laboureur*, bailiff of Montmorency, author of several pieces

of

**LABRADOR** of poetry; and an uncle, *Dom. Claude le Laboureur*, provost of the abbey of L'isle Barbe, of which abbey he wrote a history, and published notes and corrections upon the breviary of Lyons, with some other things.

**LABRADOR**, the same with *NEW-BRITAIN*.

**LABRUS**, in ichthyology, a genus of fishes belonging to the order of thoracici. The characters are as follow: The covers of the gills fleshy; the branchiostegous rays unequal in number; teeth conic, long, and blunt at their ends; one tuberculated bone in the bottom of the throat; two above, opposite to the others; one dorsal fin reaching the whole length of the back; a slender skin extending beyond each ray, with a rounded tail. There are 41 species of this genus, which vary from each other, even those of the same species, almost infinitely in colour; some of them being of a dirty red mixed with a certain duskiuess; others most beautifully striped, especially about the head, with the richest colours, such as blue, red, and yellow. Care must therefore be taken not to multiply the species from these accidental tints, but to attend to the form, which never varies. Mr Pennant mentions his having seen a species of labrus taken about the Giant's Causeway in Ireland, of a most beautiful vivid green, spotted with scarlet; and others at Bannadigan in the county of Sligo, of a pale green. To this genus belongs the fish called by the English the *old-wife*.

**LABURNUM**, in botany. See *CYTISUS*.

**LABYRINTH**, among the ancients, was a large intricate edifice cut out into various aisles and meanders running into each other, so as to render it difficult to get out of it.

There is mention made of four celebrated labyrinths among the ancients, ranked by Pliny in the number of the wonders of the world; viz. the Cretan, Egyptian, Lemnian, and Italian.

That of Crete is the most famed: it was built by Dædalus; and it was hence that Theseus made his escape by mean of Ariadne's clue.

That of Egypt, according to Pliny, was the oldest of all, and was subsisting in his time, after having stood 3600 years. He says it was built by king Petesufcus, or Tithoes; but Herodotus makes it the work of several kings: it stood on the banks of the lake Myris, and consisted of 12 palaces, and 1500 apartments: Mela says, *ter mille domos*.

That of Lemnos was supported by columns of wonderful beauty; there were some remains of it at the time when Pliny wrote.—That of Italy, was built by Porfenna king of Heturia for his tomb.

**LABYRINTH of the Ear**. See *ANATOMY*, n° 405, h, i, k, l.

**LAC**, MILK, among physicians. See *MILK*.

**LACARRY** (Giles), a learned Jesuit of the 17th century, was born in the diocese of Castrès, in Languedoc, in 1605. He taught philosophy, theology, and the holy Scriptures, in his society; was rector of the college of Cahors; and became well skilled in history. He wrote many works; the principal of which are, 1. *Hist. Galliarum sub Præfatis Prætorii Galliarum*, 4to. a work which is much esteemed, and extends from the reign of Constantine to that of Justinian. 2. *Historia Romana à Julio Cesare ad Constan-*

*tinum Magnum, per numismata & marmora antiqua*, an excellent work. 3. *Építome historie Reg. Francie, ex Dionysio Petavio excerpta*, also much esteemed. 4. An edition of Velleius Paterculus, with learned notes.

**LACCA**, Lac, or *Gum-Lac*, is a kind of wax, of which a species of winged ants form cells upon trees, like honeycombs. In these cells remain some of the dead insects, which give a red colour to the whole substance of the lac. That called *stick-lac* is the wax adhering to some of the small branches of the tree, and which is unprepared. This lac, when separated from the adhering sticks, and grossly powdered, and deprived of its colour by digestion with menstrums, for the sake of the dyes and other purposes, is called *seed-lac*; and lastly, when the stick-lac is freed from impurities, by melting it over a gentle fire, and formed into cakes, it is called *shell-lac*. Lac is unsoluble in water; and difficultly soluble in spirit of wine, which for that purpose must be well dephlegmated. According to Neuman, 16 ounces of seed-lac, distilled in an open fire, yielded nine ounces and six drams of a butter or thick oil, one ounce six drams of a watery liquor neither acid nor alkaline, and a residuum weighing two ounces and a half. It is used in the preparation of spirit varnishes, for the making of sealing-wax, and as a colouring material for dying scarlet. The colour given by lac is less beautiful, but more durable, than that given by cochineal. To render the colouring matter of the lac diffusible in water, so as to be applied to the stuffs to be dyed, Mr Hellot directs the following process: Let some powdered gum-lac be digested during two hours in a decoction of comfrey root, by which a fine crimson colour is given to the water, and the gum is rendered pale or straw-coloured. To this tincture, poured off clear, let a solution of alum be added; and when the colouring matter has subsided, let it be separated from the clear liquor and dried. It will weigh about  $\frac{1}{2}$  of the quantity of lac employed. This dried fecula is to be dissolved or diffused in warm water, and some solution of tin is to be added to it, by which it acquires a vivid scarlet colour. This liquor is to be added to a solution of tartar in boiling water; and thus the dye is prepared.

**LACE**, in commerce, a work composed of many threads of gold, silver, or silk, interwoven the one with the other, and worked upon a pillow with spindles according to the pattern designed. The open work is formed with pins, which are placed and displaced as the spindles are moved. The importation of gold and silver lace is prohibited.

*Method of Cleaning Gold-Lace and Embroidery when tarnished*.—For this purpose alkaline liquors are by no means to be used; for while they clean the gold, they corrode the silk, and change or discharge its colour. Soap also alters the shade, and even the species of certain colours. But spirit of wine may be used without any danger of its injuring either the colour or quality of the subject; and in many cases proves as effectual, for restoring the lustre of the gold, as the corrosive detergents. A rich brocade, flowered with a variety of colours, after being disagreeably tarnished, had the lustre of the gold perfectly restored by washing it with a soft brush dipped in warm spirit of wine; and some of the colours of the silk, which were likewise soiled,

Lacca,  
Laccæ.

Lace. became at the same time remarkably bright and lively. Spirit of wine seems to be the only material adapted to this intention, and probably the boasted secret of certain artists is no other than this spirit disguised. Among liquids, Dr Lewis says, he does not know of any other that is of sufficient activity to discharge the foul matter, without being hurtful to the silk: as to powders, however fine, and however cautiously used, they scratch and wear the gold, which here is only superficial and of extreme tenuity.

But tho' spirit of wine is the most innocent material that can be employed for this purpose, it is not in all cases proper. The golden covering may be in some parts worn off; or the base metal, with which it had been iniquitously alloyed, may be corroded by the air, so as to leave the particles of the gold disunited; while the silver underneath, tarnished to a yellow hue, may continue a tolerable colour to the whole: in which cases it is apparent, that the removal of the tarnish would be prejudicial to the colour, and make the lace or embroidery less like gold than it was before. A piece of old tarnished gold-lace, cleaned by spirit of wine, was deprived, with its tarnish, of greatest part of its golden hue, and looked now almost like silver-lace.

*Method of separating the Gold and Silver from Lace without burning it.* Cut the lace in pieces, and (having separated the thread from it by which it was sewed to the garment) tie it up in a linen cloth, and boil it in soap-ley, diluted with water, till you perceive it is diminished in bulk; which will take up but a little time, unless the quantity of lace be very considerable. Then take out the cloth, and wash it several times in cold water, squeezing it pretty hard with your foot, or beating it with a mallet, to clear it of the soap-ley; then untie the cloth, and you will have the metallic part of the lace pure, and nowhere altered in colour or diminished in weight.

This method is abundantly more convenient and less troublesome than the common way of burning; and as a small quantity of the ley will be sufficient, the expence will be trifling, especially as the same ley may be used several times, if cleared of the filky calcination. It may be done in either an iron or copper vessel.

The ley may be had at the soap-boilers, or it may be made of pearl-ash and quick-lime boiled together in a sufficient quantity of water.

The reason of this sudden change in the lace will be evident to those who are acquainted with chemistry: for silk, on which all our laces are wove, is an animal-substance, and all animal-substances are soluble in alkalies, especially when rendered more caustic by the addition of quick-lime; but the linen you tie it in, being a vegetable, will remain unaltered.

*Bone-Lace*, a lace made of fine linen thread or silk, much in the same manner as that of gold and silver. The pattern of the lace is fixed upon a large round pillow, and pins being stuck into the holes or openings in the patterns, the threads are interwoven by means of a number of bobbins made of bone or ivory, each of which contains a small quantity of fine thread, in such a manner as to make the lace exactly resemble the pattern. There are several towns in England, and particularly in Buckinghamshire, that carry on this manufacture; but vast quantities of the finest laces have

been imported from Flanders.

LACEDÆMON. See SPARTA.

LACERTA, the LIZARD, in zoology, a genus of amphibious animals, belonging to the order of reptilia, the characters of which are these: The body is naked, with four feet, and a tail. There are 49 species, the most remarkable are,

I. The *crocodylus*, or crocodile, has a compressed jagged tail, five toes on the fore-foot, and four on the hind-foot. This is the largest animal of the lizard kind. One that was dissected at Siam, an account of which was sent to the Royal Academy at Paris, was 18 feet and a half long, of which the tail was no less than five feet and a half, and the head and neck above two and a half. He was four feet and nine inches in circumference where thickest.

The hinder legs, including the thigh and the paw, were two feet and two inches long; the paws, from the joint to the extremity of the longest claws, were above nine inches. They were divided into four toes; of which three were armed with large claws, the longest of which was an inch and a half, and seven lines and a half broad at the root. The fourth toe was without a nail, and of a conical figure; but was covered with a thick skin like shagreen leather. These toes were united with membranes like those of ducks, but much thicker.

The fore-legs had the same parts and conformation as the arms of a man, both within and without; but they were somewhat shorter than those behind. The hands had five fingers, the two last of which had no nails, and were of a conical figure, like the fourth toe on the hind paws. The head was long, and had a little rising at the top; but the rest was flat, and especially towards the extremity of the jaws. It was covered with a skin, which adhered firmly to the skull and to the jaws. The skull was rough and unequal in several places; and about the middle of the forehead there were two bony crests, about two inches high. They were not quite parallel, but separated from each other in proportion as they mounted upwards.

The eye was very small in proportion to the rest of the body, and was so placed within its orbit, that the outward part, when shut, was only a little above an inch in length, and run parallel to the opening of the jaws.

The nose was placed in the middle of the upper jaw, near an inch from its extremity, and was perfectly round and flat, being two inches in diameter, of a black, soft, spongy substance, not unlike the nose of a dog. The nostrils were in the form of a Greek capital  $\pi$ ; and there were two caruncles which filled and closed them very exactly, and which opened as often as he breathed through the nose. The jaws seemed to shut one within another by means of several apophyses, which proceeded from above downwards, and from below upwards, there being cavities in the opposite jaw to receive them. They had 27 dog-teeth in the upper jaw, and 15 in the lower, with several void spaces between them. They were thick at the bottom, and sharp at the point; being all of different sizes, except ten large hooked ones, six of which were in the lower jaw, and four in the upper. The mouth was 15 inches in length, and eight and a half in breadth where broadest; and the distance of the two jaws, when open-

ed as wide as they could be, was 15 inches and a half. The skull, between the two crests, was proof against a musket-ball, for it only rendered the part a little white that it struck against.

The colour of the body was of a dark brown on the upper part, and of a whitish citron below, with large spots of both colours on the sides. From the shoulders to the extremity of the tail he was covered with large scales of a square form, disposed like parallel girdles, and were 52 in number; but those near the tail were not so thick as the rest. In the middle of each girdle there were four protuberances, which became higher as they approached the end of the tail, and composed four rows, of which the two in the middle were lower than the remaining two, forming three channels, which grew deeper the nearer they came to the tail, and were confounded with each other about two feet from its extremity.

The skin was defended with a sort of armour, which, however, was not proof against a musket-ball, contrary to what has been commonly said. However, it must be acknowledged, that the attitude in which it was placed might contribute not a little thereto; for probably, if the ball had struck obliquely against the shell, it would have flown off. Those parts of the girdles underneath the belly were of a whitish colour, and were made up of scales of divers shapes. They were about one-sixth of an inch in thickness, and were not so hard as those on the back.

This creature lays eggs, which the covers over with sand, and leaves to be hatched by the heat of the sun. They are to be met with in the river Nile, Niger, and Ganges, besides most other large rivers in the southern parts of Asia, Africa, and America.

Mr Hasselquist informs us, that the crocodile swallows stones to assist digestion, after the manner of feed-eating birds, which commit to the stomach the work of mastication as well as concoction, being destitute of the instruments adapted to that purpose. The Egyptians say, that his excrements do not pass by the anus: this seems to be confirmed by the structure of the gut, which is near the pylorus; for it cannot easily be conceived, that excrements should pass thro' such a narrow passage, seemingly destined for the conveyance of the chyle only; but the structure of the parts, and the gut being so near the pylorus, seem to indicate that the excrements pass through it into the ventricle, and are vomited up. The inhabitants above Cairo say they see this daily; and observe, that the crocodile is obliged to come on shore as often as he has occasion to ease himself. There is a folliculus, of the bigness of a hazel-nut, under the shoulders of the old crocodiles, which contains a thick matter, smelling like musk. The Egyptians are very anxious to get this when they kill a crocodile, it being a perfume much esteemed by the grandees. When the male copulates with the female, he turns her with his snout on her back. The Egyptians use the fat against the rheumatism and stiffness of the tendons, esteeming it a powerful remedy outwardly applied. They say the gall is good for the eyes; they make use of it as a certain remedy for barrenness in women, taking about six grains internally, and outwardly they apply a pessus made of cotton and the gall of a crocodile. The eyes of the crocodile are the best aphrodisiacs of any known by the Arabs; who

prefer them to all confessions dea-satyrii, hyacinthi, &c. and even to ambergrease.

The crocodile is a very dangerous and terrible animal in some countries. It does a great deal of mischief among the common people of Upper Egypt, often killing and devouring women who come to the river to fetch water, and children playing on the shore or swimming in the river. In the stomach of one dissected before Mr Barton the English consul, they found the bones of the legs and arms of a woman, with the rings which they wear in Egypt as ornaments. These animals are seen in some places lying for whole hours, and even days, stretched in the sun and motionless; so that one not used to them might mistake them for trunks of trees covered with a rough and dry bark: but the mistake would soon be fatal; for the seemingly torpid animal, at the near approach of any living creature, instantly darts upon it, and carries it to the bottom. In the times of an inundation they sometimes enter the cottages of the natives, where they seize the first animal they meet with. There have been several examples of their taking a man out of a canoe in the sight of his companions, without their being able to lend him any assistance. The crocodile, however, except when pressed with hunger, or with a view of depositing its eggs, seldom leaves the water. Its usual method is to float along upon the surface, and seize whatever animals come within its reach; but when this method fails, it then goes closer to the bank. There it waits in patient expectation of some land-animal that comes to drink; the dog, the bull, the tiger, or man himself. Nothing is to be seen as the animal approaches, nor is its retreat discovered till it is too late for safety. It seizes the victim with a spring, and goes at a bound much faster than such an unwieldy animal could be supposed to do; then having secured the creature both with teeth and claws, it drags it into the water, instantly sinks with it to the bottom, and in this manner quickly drowns it. Sometimes it happens, that the creature wounded by the crocodile makes its escape; in which case, the latter pursues with great celerity, and often takes it a second time. In these depredations, however, this terrible animal often seizes on another as formidable as itself, and meets with a desperate resistance. We are told of frequent combats between the crocodile and the tiger. All creatures of the tiger kind are continually oppressed by a parching thirst, that keeps them in the vicinity of great rivers, whither they descend to drink very frequently. On these occasions they are seized by the crocodile; upon whom they instantly turn with the greatest agility, and force their claws into his eyes, while he plunges, with his fierce antagonist, into the river. There they continue to struggle for some time, till at last the tiger is drowned. Notwithstanding all this, however, we are assured by Labat, that a negro, with no other weapon than a knife in his right hand, and his left arm wrapped round with a cow-hide, ventures boldly to attack this animal in its own element. As soon as he approaches the crocodile, he presents his left arm, which the animal swallows most greedily: but as it sticks in his throat, the negro has time to give it several stabs below the chin, where it is easily vulnerable; and the water also getting in at the mouth, which is held involun-

The natives of Siam seem particularly fond of the capture of all the great animals with which their country abounds. The crocodiles are taken by throwing three or four strong nets across a river, at proper distances from each other; so that if the animal breaks through the first, it may be caught by one of the rest. When it is first taken, it employs the tail, which is the grand instrument of strength, with great force; but after many unsuccessful struggles, the animal's strength is at last exhausted. Then the natives approach their prisoner in boats, and pierce him in the most tender parts till he is weakened by loss of blood. When he has done stirring, they begin by tying up his mouth, and with the same cord tie his head to his tail, which last they bend back like a bow. However, they are not yet perfectly secure from his fury; but for their greater safety they tie his forefeet, as well as those behind, to the top of his back. These precautions are not useless; for if they were to omit them, the crocodile would soon recover strength enough to do a great deal of mischief. When thus brought into subjection, or when taken young and tamed, this formidable animal is used to divert and entertain the great men of the east. It is often managed like an horse; a curb is put into its mouth, and the rider directs it as he thinks proper. Though awkwardly formed, it does not fail to proceed with some degree of swiftness; and is thought to move as fast as some of the most unworldly of our own animals, the hog or the cow. Some indeed assert, that no animal could escape it but for its slowness in turning; which, however, seems very improbable, as its back-bone is full of articulations, and seemingly as flexible as that of other large animals.

All crocodiles breed near fresh waters; and though they are sometimes found in the sea, yet that may be considered rather as a place of excursion than abode. They produce their young by eggs, as was said above; and for this purpose, the female, when she comes to lay, chooses a place by the side of a river, or some fresh-water lake, to deposit her brood in. She always pitches upon an extensive sandy shore, where she may dig a hole without danger of detection from the ground being fresh turned up. The shore must also be gentle and helving to the water, for the greater convenience of the animal's going and returning; and a convenient place must be found near the edge of the stream, that the young may have a shorter way to go. When all these requisites are adjusted, the animal is seen cautiously stealing up on shore to deposit her burden. The presence of a man, a beast, or even a bird, is sufficient to deter her at that time; and if she perceives any creature looking on, the infallibly returns. If, however, nothing appears, she then goes to work, scratching up the sand with her fore-paws, and making a hole pretty deep in the shore. There she deposits from 80 to 100 eggs, of the size of a tennis-ball, and of the same figure, covered with a tough white skin like parchment. She takes above an hour to perform this task; and then, covering up the place so artfully that it can scarcely be perceived, she goes back to return again the next day. Upon her return, with the same precaution as before, she lays about the same number of eggs; and the day following also a like number.

Thus having deposited her whole quantity, and having covered them close up in the sand, they are soon vivified by the heat of the sun; and at the end of 30 days, the young ones begin to break open the shell. At this time the female is instinctively taught that her young ones want relief; and she goes upon land to scratch away the sand and set them free. Her brood quickly avail themselves of their liberty; a part run unguided to the water; another part ascend the back of the female, and are carried thither in greater safety. But the moment they arrive at the water, all natural connexion is at an end; when the female has introduced her young to their natural element, not only she, but the male, become amongst the number of their most formidable enemies, and devour as many of them as they can. The whole brood scatters into different parts at the bottom; by far the greatest number are destroyed, and the rest find safety in their agility or minuteness.

But it is not the parent alone that is thus found to thin their numbers; the eggs of this animal are not only a delicious feast to the savage, but are eagerly sought after by every beast and bird of prey. The ichneumon was erected into a deity among the ancients for its success in destroying the eggs of these monsters; at present, that species of the vulture called the *gallinazo* is their most prevailing enemy. All along the banks of great rivers, for thousands of miles, the crocodile is seen to propagate in numbers that would soon over-run the earth, but for the vulture, that seems appointed by Providence to abridge its fecundity. These birds are ever found in great numbers where the crocodile is most numerous; and hiding themselves within the thick branches of the trees that shade the banks of the river, they watch the female in silence, and permit her to lay all her eggs without interruption. Then when she has retired, they encourage each other with cries to the spoil; and flocking all together upon the hidden treasure, tear up the eggs, and devour them in a much quicker time than they were deposited. Nor are they less diligent in attending the female while she is carrying her young to the water; for if any one of them happens to drop by the way, it is sure to receive no mercy.

Such is the extraordinary account given us by late travellers of the propagation of this animal; an account adopted by Linnaeus and the most learned naturalists of the age. Yet, if one might argue from the general analogy of nature, the crocodile's devouring her own young when she gets to the water seems doubtful. This may be a story raised from the general idea of this animal's rapacious cruelty; when, in fact, the crocodile only seems more cruel than other animals because it has more power to do mischief. It is probable, that it is not more devoid of parental tenderness than other creatures; and we are the more led to think so from the peculiar formation of one of the crocodile kind. This is called the *open-bellied crocodile*, and is furnished with a false belly like the opossum, where the young creep out and in as their dangers or necessities require. The crocodile, thus furnished at least, cannot be said to be an enemy to her own young, since she thus gives them more than parental protection. It is probable also, that this open-bellied crocodile is viviparous, and fosters her young that are prematurely excluded in this second womb, until they

come

come to proper maturity.

How long the crocodile lives, we are not certainly informed: if we may believe Aristotle, it lives the age of a man; but the ancients so much amused themselves in inventing fables concerning this animal, that even truth from them is suspicious. What we know for certain from the ancients is, that among the various animals that were produced to fight in the amphitheatre at Rome, the combat of the crocodile was not wanting. Marcus Scaurus produced them living in his unrivalled exhibitions; and the Romans considered him as the best citizen, because he furnished them with the most expensive entertainments.

The last mentioned kind of crocodile is a species not described by Linnæus. Mr Edwards tells us, that three of these creatures were sent from Bengal, about the year 1747, to the late Dr Mead physician in ordinary to the king. Two of these the Doctor preferred in his collection, and presented the third to the late curious Mrs Kennon; and since the decease of these worthy persons, they became the property of Mr James Lemon of London, who obliged our author with one of them to produce to the royal society. The narrowness of the beak is the most extraordinary circumstance in this crocodile, which appears like the bill of the bird called *gooseander*. It has small sharp teeth. Another peculiarity is a paunch or open purse in the middle of the under side of the belly, which seems to be naturally formed with round hips, and hollow within, to receive its young in time of danger, as it appears in the American animal called *opossum*. Dr Parson gave it as his opinion, that the opening in the belly was really natural, it having no appearance of being cut or torn open. In other respects it hath all the marks common to alligators or crocodiles. The beak was finely creased transversely. The animal appeared, in the spirits, all over of a yellowish oval colour, the under side lighter than the upper, the latter having some dusky marks and spots. This species inhabits the banks of the Ganges; and it is very strange that they should never have been described before, as our India company have been so long settled there, and the animal is, at full growth, nearly, if not altogether, as large as the common crocodile.

II. The *caudiverbera*, has a depressed pinnatifid tail, and palmated feet. It is larger than the common green lizard, is found in Peru, and has got its name from its beating the ground with its tail.

III. The *stellio* has a verticillated tail, and dentated scales. It is a native of Africa, and the warm parts of Asia. It frequents the ruinous walls of Natolia, Syria, and Palestine. The Arabs call it *hardun*. The Turks kill it; for they imagine, that, by declining the head, it mimics them while they say their prayers.

IV. The *agilis*, has a pretty long verticillated tail, with sharp scales, and a scaly collar. This is the common green lizard, and is a native both of Europe and India. This species is extremely nimble: in hot weather, it basks on the sides of dry banks or old trees; but, on being observed, immediately retreats to its hole. The food of this species, as well as of all the other British lizards, is insects; and they themselves are devoured by birds of prey. They are all perfectly harmless; yet their form strikes one with disgust, and has occasioned great obscurity in their history.

Mr Pennant mentions a lizard killed in Worcestershire in the year 1714, which was two feet six inches long, and four inches in girth. The fore-legs were placed eight inches from the head; the hind-legs five inches beyond those: the legs were two inches long; the feet divided into four toes, each furnished with a sharp claw. Another of the same kind was afterwards killed in that county; but whether these large lizards were natives of other countries and imported into England, or whether they were of British growth, is uncertain.

5. The chameleon has a crooked cylindrical tail. The head of a large chameleon is almost two inches long, and from thence to the beginning of the tail it is four inches and a half. The tail is five inches long, and the feet two and a half. The thickness of the body is different at different seasons; for sometimes from the back to the belly it is two inches, and sometimes but one; for he can blow himself up and contract himself at pleasure. This swelling and contraction is not only of the back and belly, but of the legs and tail.

These different motions are not like those of other animals, which proceed from a dilatation of the breast in breathing, and which rises and falls successively; but they are very irregular, as in tortoises and frogs. The chameleon has continued as it were blown up for two hours together, and then he would grow less and less insensibly; for the dilatation was always more quick and visible than the contraction. In this last state he appeared extremely lean, and the spine of the back was sharp, and all his ribs might be told; likewise the tendons of the arms and legs might be seen very distinctly.

The skin is very cold to the touch; and notwithstanding he seems so lean, there is no feeling the beating of the heart. The surface of the skin is unequal, and has a grain not unlike shagreen, but very soft, because each eminence is as smooth as if it was polished. Some of these are as large as a middling pin's head on the arms, legs, belly, and tail; but on the shoulders and head they are of an oval figure, and a little larger. Those under the throat are ranged in the form of a chaplet, from the lower lip to the breast. Some on the head and back are amassed together in clusters, with spaces between them, on which are almost imperceptible spots of a pale red and yellow colour, as well as the ground of the skin itself, which plainly appears between these clusters. This ground changes colour when the animal is dead, becoming of a greyish brown, and the small spots are whitish.

The colour of all these eminences, when the chameleon is at rest in a shady place, is of a bluish grey, except on the claws, where it is white with a little yellow; and the spaces between the clusters is of a pale red and yellow, as was before observed. But when he is in the sun, all parts of the body which are affected with the light, become of a greyish brown, or rather of a tawny. That part of the skin which the sun does not shine on, changes into several brighter colours, which form spots of the size of half one's finger. Some of these descend from the spine half way on the back; and others appear on the sides, arms, and tail. They are all of an isabella colour, from a mixture of a pale yellow and of a bright red, which is the colour of the ground of the skin.

Lacerta.

The head of a chameleon is not unlike that of a fish, it being joined to the breast by a very short neck, covered on each side with cartilaginous membranes resembling the gills of fishes. There is a crest directly on the top of the head, and two others on each side above the eyes, and between these there are two cavities near the top of the head. The muzzle is blunt, and not much unlike that of a frog: at the end there is a hole on each side for the nostrils; but there are no ears, nor any sign of any.

The jaws are furnished with teeth, or rather with a bone in the form of teeth, which he makes little or no use of, because he lives upon swallowing flies and other insects, without chewing them; and hence arose the vulgar notion of his living upon air, because he was never seen to eat. The form, structure, and motion of the eyes, have something very particular; for they are very large, being almost half an inch in diameter. They are of a globous figure; which may be easily seen, because they stand out of the head. They have a single eye-lid like a cap, with a hole in the middle, through which the sight of the eye appears, which is of a shining brown, and round it there is a little circle of a gold colour. This eye-lid has a grain like shagreen, as well as the other parts of the skin; and when the rest of the body changes colour, and assumes spots of different shapes, those on the lid always keep the same form, though they are tintured with the same colour as the skin. But the most extraordinary thing relating to the eyes is, that this animal often moves one when the other is entirely at rest; nay, sometimes one eye will seem to look directly forward and the other backward, and one will look up to the sky when the other regards the earth.

That part of the body which is called the *trunk*, and comprehends the thorax and the belly in a chameleon, is almost all thorax, with little or no belly. The four feet are all of a length; and the only difference between them is, that those before are turned backwards, and those behind forwards. There are five toes on each paw, which have a greater resemblance to hands than feet. They are all divided into two, which gives the appearance of two hands to each arm, and two feet to each leg; and though one of these parts have three toes, and the other but two, yet they seem to be all of the same size. These toes lie together under the same skin as in a mitten; however, their shape might be seen through the skin. With these paws the chameleon can lay hold of the small branches of trees in the same manner as a parrot. When he is about to perch, he parts his toes differently from birds, because he puts two behind and two before. The claws are little, crooked, very sharp, and of a pale yellow, proceeding but half way out of the skin, while the other half is hid beneath it. His walk is slower than that of a tortoise, and he seems to move along with an affectation of gravity. He seems to seek for a proper place to set his feet upon; and when he climbs up trees, he does not trust to his feet like squirrels, but endeavours to find out clefts in the bark, that he may get a surer hold.

His tail is like that of a viper, when it is puffed up and round; for otherwise the bones may be seen in the same manner as on the back. He always wraps his tail round the branches of trees, and it serves him

as it were instead of a fifth hand. — He is a native of Africa and Asia. Mr Hasselquist is of opinion, that the change of colour in the chameleon is owing to its being exceedingly subject to the jaundice, which particularly happens either when it is exposed to the sun, or when it is made angry. The mixture of the bile with its blood is then very perceptible, and, as the skin is transparent, makes it spotted with green and yellow. He never saw it coloured with red, blue, or purple; and does not believe that ever it assumes these colours.

6. The gecko has a cylindrical tail, concave ears, and a warty body. It is the indian salamander of Bontius. "This animal is very frequent in Cairo, (says Hasselquist), both in the houses and without them. The poison of this animal is very singular, as it exhales from the lobuli of the toes. The animal seeks all places and things impregnated with sea-salt, and, passing over them several times, leaves this very noxious poison behind it. In July 1750, Mr Hasselquist saw two women and a girl in Cairo at the point of death, from eating cheese new salted, bought in the market, and on which this animal had dropt its poison. Once at Cairo, I had an opportunity of observing how acrid the exhalations of the toes of this animal are, as it ran over the hand of a man who endeavoured to catch it; there immediately rose little pustules over all those parts the animal had touched; these were red, inflamed, and smarted a little, greatly resembling those occasioned by the stinging of nettles. It emits an odd sound, especially in the night, from its throat, not unlike that of a frog."

7. The scincus has a cylindrical tail compressed at the point, and blunt margined toes. This animal is found in Arabia Petrea near the Red Sea, and in Upper Egypt near the Nile. It is much used by the inhabitants of the east as an aphrodisiac, but not at this time by the Europeans. The flesh of the animal is given in powder, with some stimulating vehicle; broth made of the recent flesh is likewise used by the Arabs. It is brought from Upper Egypt and Arabia to Alexandria, whence it is carried to Venice and Marseilles, and from thence to all the apothecaries shops of Europe. It has been an error common to almost all authors, to imagine the scincus to be a fish.

8. The nilotica has a long tail with a triangular edge, and four lines of scales on the back. It is met with in the moist places of Egypt near the Nile. The Egyptians say that this lizard proceeds from the eggs of the crocodile laid in the sand, but that the crocodile proceeds from those laid in the water. Mr Hasselquist hath detected the fallacy of this account.

9. The palustris has a lanceolated tail, and four toes on the fore-feet, and inhabits the stagnating waters of Europe. It has a slow and crawling pace. Mr Pennant mentions his having more than once found, under stones and old logs, some very minute lizards that had much the appearance of this kind: they were perfectly formed, and had not the least vestiges of fins; which circumstance, joined to their being found in a dry place remote from water, seems to indicate, that they had never been inhabitants of that element, as it is certain many of our lizards are in their first state. At that period they have a fin above and below their tail; that on the upper part extends along the back as far as the head; but both drop off as soon as the animal takes

(See Appendix)

**Laches** takes to the land, being then no longer of any use. Mr Ellis has remarked certain pennated fins at the gills of one very common in most of our stagnating waters, and which is frequently observed to take a bait like a fish.

10. The salamandra, or salamander, has a short cylindrical tail, four toes on the fore-feet, and a naked porous body. This animal has been said, even in the Philosophical Transactions, to live in the fire; but this is found to be a mistake. Its properties are very little known. It is found in the southern countries of Europe.

11. The basiliskus, has a long cylindrical tail, a raised fin on the back, and a crest on the throat. It is a native of the Indies. See fig. 6.

**LACHES**, (from the French *lacher*, i. e. *laxare*, or *lache*, *ignavus*), in the English law signifies slackness or negligence, as it appears in Littleton, where *laches of entry* is a neglect of the heir to enter. And probably it may be an old English word: for where we say there is *laches of entry*, it is all one as if it were said there is a *lack of entry*; and in this signification it is used. No *laches* shall be adjudged in the heir within age; and regularly, *laches* shall not bar infants or femme covert for not entry or claim, to avoid defects; but *laches* shall be accounted in them for non-performance of a condition annexed to the state of the land.

**LACHRYMAL**, in anatomy, an appellation given to several parts of the eye. See **ANATOMY**, n° 406.f.

**LACHRYMATORY**, in antiquity, a vessel wherein were collected the tears of a deceased person's friends, and preserved along with the ashes and urn. They were small glass or earthen bottles, chiefly in the form of phials. At the Roman funerals, the friends of the deceased, or the *præfices*, women hired for that purpose, used to fill them with their tears, and deposit them very carefully with the ashes, in testimony of their sorrow; imagining the manes of the deceased were thereby greatly comforted. Many specimens of them are preserved in the cabinets of the curious, particularly in the British Museum.

**LACINIUM**, (anc. geog.) a noble promontory of the Brutii in Italy, the south boundary of the Sinus Tarentinus and the Adriatic; all to the south of it being deemed the Ionian Sea: it was famous for a rich temple of Juno, surnamed *Lacinia*, with a pillar of solid gold standing in it; which Hannibal intending to carry off, was, according to Cicero, dissuaded by a dream. Now *Capo delle Colonne*, from the columns of Juno's temple still standing on the north-east coast of the Calabria ultra.

**LACQUERS**, are varnishes applied upon tin, brass, and other metals, to preserve them from tarnishing, and to improve their colour. The basis of lacquers is a solution of the resinous substance called *seed lac*, in spirit of wine. The spirit ought to be very much dephlegmated, in order to dissolve much of the lac. For this purpose, some authors directly dry potash to be thrown into the spirit. This alkali attracts the water, with which it forms a liquid that subsides distinctly from the spirit at the bottom of the vessel. From this liquid the spirit may be separated by decantation. By this method the spirit is much dephlegmated; but, at the same time, it becomes im-

pregnated with part of the alkali, which depraves its colour, and communicates a property to the lacquer of imbibing moisture from the air. These inconveniences may be prevented by distilling the spirit; or, if the artist has not an opportunity of performing that process, he may cleanse the spirit in a great measure from the alkali, by adding to it some calcined alum; the acid of which uniting with the alkali remaining in the spirit, forms with it a vitriolated tartar, which, not being soluble in spirit of wine, falls to the bottom together with the earth of the decomposed alum. To a pint of the dephlegmated and purified spirit, about three ounces of powdered shell-lac are to be added; and the mixture to be digested during some day with a moderate heat. The liquor ought then to be poured off, strained, and cleared by settling. This clear liquor is now fit to receive the required colour from certain resinous colouring substances; the principal of which are gamboge and annatto; the former of which gives a yellow, and the latter an orange colour. In order to give a golden colour, two parts of gamboge are added to one of annatto; but these colouring substances may be separately dissolved in the tincture of lac, and the colour required may be adjusted by mixing the two solutions in different proportions. When silver leaf, or tin, are to be lacquered, a larger quantity of the colouring materials are requisite than when the lacquer is intended to be laid on brass.

**LACTATIO**, **LACTATION**, or *Giving Suck*. The mother's-breast, if possible, should be allowed the *Medical Dictionary* child, at least during the first month; for thus the child is more peculiarly benefited by what it sucks, and the mother is preserved from more real inconveniences, than the falsely delicate imagine they would suffer by compliance herewith: but if by reason of an infirm constitution, or other causes, the mother cannot suckle her child, let dry nursing under the mother's eye be pursued.

When women lose their appetite by giving suck, both the children and themselves are thereby injured; wet nurses are to be preferred, who during the time they give the breast, have rather an increased appetite, and digest more quickly; the former are apt to waste away, and sometimes die consumptive. In short, those nurses with whom lactation may for a while agree, should wean the child as soon as their appetite lessens, their strength seems to fail, or a tendency to hysterical symptoms are manifest.

When the new-born child is to be brought up by the mother's breast, apply it thereto in ten or twelve hours after delivery; thus the milk is sooner and more easily supplied, and there is less hazard of a fever, than when the child is not put to it before the milk begins to flow of itself.

If the mother does not suckle her child, her breasts should be so kept warm with flannels, or with a hare-skin, that a constant perspiration may be supported; thus there rarely will arise much inconvenience from the milk.

The child, notwithstanding all our care in dry nursing, sometimes pines if a breast is not allowed. In this case a wet nurse should be provided, if possible one that hath not been long delivered of a child. She should be young, of a healthy habit, and an active disposition, a mild temper, and whose breasts are well filled

Lactantius,  
Lactical.

filled with milk. If the milk is good, it is sweetish to the taste, and totally free from saltness; to the eye it appears thin, and of a bluish cast. That the woman hath her menses, if in other respects objections are not made, this need not be any; and as to the custom with many, of abstaining from venery while they continue to suckle a child, it is so far without reason to support it, that the truth is, a rigorous chastity is as hurtful, and often more pernicious, than an immoderate use of venery. Amongst the vulgar errors, is that of red-haired women being improper for wet nurses.

If the menses do not appear during the first months, but after six or eight months suckling they begin to descend, the child should be weaned.

Wet nurses should eat at least one hearty meal of animal-food every day; with this, a proper quantity of vegetables should be mixed. Thin broth, or milk, are proper for their breakfasts and their suppers; and if the strength should seem to fail a little, a draught of good ale should now and then be allowed: but spirituous liquors must, in general, be foreborne; not but a spoonful of rum may be allowed in a quart of milk and water, (*i. e.* a pint of each), which is a proper common drink.

Though it is well observed by Dr Hunter, that the far greater number of those women who have cancers in the breast or womb, are old maids, and those who refuse to give suck to their children; yet it is the unhappiness of some willing mothers not to be able: for instance, those with tender constitutions, and who are subject to nervous disorders; those who do not eat a sufficient quantity of solid food, nor enjoy the benefit of exercise and air: if children are kept at their breasts, they either die whilst young, or are weak and sickly after childhood is past, and so on through remaining life.

LACTANTIUS (Lucius Cælius Firmianus), a celebrated author at the beginning of the 4th century, was, according to Baronius, an African; but, according to others, was born at Fermo in the marquise of Anconia, from whence it is imagined he was called *Firmianus*. He studied rhetoric under Arnobius; and was afterwards a professor of that science in Africa and Nicomedia, where he was so admired, that the emperor Constantine chose him preceptor to his son Crispus Cæsar. Lactantius was so far from seeking the pleasures and riches of the court, that he lived there in poverty, and, according to Eusebius, frequently wanted necessaries. His works are written in elegant Latin. The principal of which are, 1. *De ira divina*. 2. *De operibus Dei*, in which he treats of the creation of man, and of divine providence. 3. *Divine Institutions*, in seven books. This is the most considerable of all his works: he there undertakes to prove the truth of the Christian religion, and to refute all the difficulties that had been raised against it; and he solidly and with great strength attacks the illusions of paganism. His style is pure, clear, and natural, and his expressions noble and elegant, on which account he has been called the *Cicero of the Christians*. There is also attributed to him a treatise *De morte persecutorum*; but several of the learned doubt its being written by Lactantius. The most copious edition of Lactantius's works is that of Paris, in 1748, 2 vols 4to.

LACTEAL VESSELS. See ANATOMY, n° 369.

LACTIFEROUS, an appellation given to plants *Lactiferous*, abounding with a milky juice, as the low-thistle and the like. The name of *lactiferous*, or *lactescent*, is given to all those plants which abound with a thick-coloured juice, without regarding whether it is white or not. Most lactiferous plants are poisonous, except those with compound flowers, which are generally of an innocent quality.

Of the poisonous lactescent plants the most remarkable are sumach, agaric, maple, burning thorny plant, cassida, celandine, puccoon, prickly poppy, and the plants of the natural order *contorta*, as swallow-wort, apocynum, cynanchum, and cerbera.

The bell-shaped flowers are partly noxious, as cardinal flower; partly innocent, as campanula.

Among the lactescent plants with compound flowers that are innocent in their quality, may be mentioned dandelion, picris, hyoseris, wild lettuce, gum-succory, hawk-weed, bastard hawk-weed, hypochaeris, goat's-beard, and most species of lettuce: we say most species, because the prickly species of that genus are said to be of a very virulent and poisonous nature; though Mr Lightfoot denies this, and affirms that they are a safe and gentle opiate, and that a syrup made from the leaves and stalks is much preferable to the common diacodium.

LACTUCA, LETTUCE; a genus of the polygamia æqualis order, belonging to the syngenesia class of plants. There are several species, most of which are plants of no use, and never cultivated but in botanic gardens for variety. Those commonly cultivated in the kitchen-garden for use are, 1. The common or garden lettuce. 2. Cabbage lettuce. 3. Silesia lettuce. 4. Dutch brown lettuce. 5. Aleppo lettuce. 6. Imperial lettuce. 7. Green capuchin lettuce. 8. Verfailles or upright white Cos lettuce. 9. Black Cos. 10. Red Cos. 11. Red capuchin lettuce. 12. Roman lettuce. 13. Prince lettuce. 14. Royal lettuce. 15. Egyptian Cos lettuce.

The first of these sorts is very common in all gardens, and is commonly sown for cutting very young, to mix with other salad herbs in spring; and the second, or cabbage-lettuce, is only this mended by culture. It may be sown at all times of the year, but in the hot months requires to be sown in shady borders. The cabbage-lettuce may also be sown at different seasons, to have a continuation of it through the summer. The first crop should be sown in February, in an open situation; the others, at three weeks distance; but the later ones under covert, but not under the drippings of trees.

The Silesia, imperial, royal, black, white, and upright Cos lettuces, may be sown in the latter end of February or the beginning of March, on a warm light soil, and in an open situation; when the plants are come up, they must be thinned to 15 inches distance every way, they will then require no farther care than the keeping them clear of weeds; and the black Cos, as it grows large, should have its leaves tied together to whiten the inner part. Succeeding crops of these should be sown in April, May, and June; and toward the latter end of August they may be sowed for a winter crop, to be preserved under glasses, or in a bed arched over with hoops and covered with mats.

The most valuable of all the English lettuces are the

Lacunar  
||  
Ladder.

the white Cos, or the Versailles, the Silesia, and the black Cos. The brown Dutch and the green capuchin are very hardy, and may be sown late, under walls, where they will stand the winter, and be valuable when no others are to be had. The red capuchin, Roman, and prince lettuce, are very early kinds, and are sown for variety; as also the Aleppo ones for the beauty of their spotted leaves.

The milk of the common garden-lettuce is hypnotic, while the root of the plant is cooling, diluent, and nourishing.

LACUNAR, in architecture, an arched roof or ceiling, more especially the planking or flooring above porticos or piazzas.

LACYDES, a Greek philosopher, born at Cyrene, was the disciple of Arcesilaus, and his successor in the academy. He taught in a garden given him by Attalus king of Pergamus; but that prince sending for him to court, he replied, "That the pictures of kings should be viewed at a distance." He imitated his master in the pleasure he took in doing good without caring to have it known: he had a goose which followed him every where, by night as well as by day; and when the died, he made a funeral for her, which was as magnificent as if it had been for a son or a brother. He taught the same doctrine as Arcesilaus; and pretended that we ought to determine nothing, but always to suspend our opinion. He died 212 B.C.

LADDER, a frame made with a number of steps, by means of which people may ascend as on a stair to places otherwise inaccessible.

Scaling LADDERS, in the military art, are used in scaling when a place is to be taken by surprize. They are made several ways: here we make them of flat flaves, so that they may move about their pins, and shut like a parallel ruler, for conveniently carrying them: the French make them of several pieces, so as to be joined together, and to be made of any necessary length: sometimes they are made of single ropes, knotted at proper distances, with iron hooks at each end, one to fasten them upon the wall above, and the other in the ground; and sometimes they are made with two ropes, and flaves between them, to keep the ropes at a proper distance, and to tread upon. When they are used in the action of scaling walls, they ought to be rather too long than too short, and to be given in charge only to the stoutest of the detachment. The soldiers should carry these ladders with the left arm passed through the second step, taking care to hold them upright close to their sides, and very short below, to prevent any accident in leaping into the ditch.

The first rank of each division, provided with ladders, should set out with the rest at the signal, marching resolutely with their firelocks slung, to jump into the ditch: when they are arrived, they should apply their ladders against the parapet, observing to place them towards the salient angles rather than the middle of the curtain, because the enemy have less force there. Care must be taken to place the ladders within a foot of each other, and not to give them too much nor too little slope, so that they may not be overturned or broke with the weight of the soldiers mounting upon them.

Laden  
||  
Ladrone.

The ladders being applied, they who have carried them, and they who come after, should mount up, and rush upon the enemy sword-in-hand: if he who goes first, happens to be overturned, the next should take care not to be thrown down by his comrade; but, on the contrary, immediately mount himself, so as not to give the enemy time to load his piece.

As the soldiers who mount first may be easily tumbled over, and their fall may cause the attack to fail, it would perhaps be right to protect their breasts with the fore-parts of cuirasses; because, if they can penetrate, the rest may easily follow.

The success of an attack by scaling is infallible, if they mount the four sides at once, and take care to shower a number of grenades amongst the enemy, especially when supported by some grenadiers and piquets, who share the attention and fire of the enemy.

LADEN, in the sea-language, the state of a ship when she is charged with a weight or quantity of any sort of merchandizes, or other materials, equal to her tonnage or burthen. If the cargo with which she is laden is extremely heavy, her burthen is determined by the weight of the goods; and if it is light, she carries as much as she can *flow*, to be fit for the purposes of navigation. As a ton in measure is generally estimated at 2000 lb. in weight, a vessel of 200 tons ought accordingly to carry a weight equal to 400,000 lb. when the matter of which the cargo is composed is specifically heavier than the water in which she floats; or, in other words, when the cargo is so heavy that she cannot float high enough with so great a quantity of it as her hold will contain.

LADEN in *Bulk*, the state of being freighted with a cargo which is neither in casks, boxes, bales, nor casks, but lies loose in the hold; being defended from the moisture or wet of the hold, by a number of mats and a quantity of *dumage*. Such are usually the cargoes of corn, salt, or such materials.

LADENBURG, a town of Germany in the Palatinate of the Rhine, seated on the river Neckar, in E. Long. 8. 42. N. Lat. 49. 27. It belongs to the bishopric of Worms, and the elector Palatine.

LADISLAUS, the name of several kings of Poland. See *POLAND*.

LADOGA, a town of the Russian empire, seated on a great lake of the same name, which has a communication with the gulph of Finland, by the river Nieva; and it abounds in fish, particularly salmon. E. Long. 33. 29. N. Lat. 60. 0.

LADOGNA, or LACEDOGNA, a town of Italy, in the kingdom of Naples, and in the Capitanata, with a bishop's see. E. Long. 15. 12. N. Lat. 41. 16.

LADRONE or MARIAN *Islands*, a cluster of 12 islands lying in the Pacific Ocean, in about 145° of east longitude, and between the 11th and 21st degree of north latitude. They were first discovered by Magellan, who sailed round the world through the Straits which bear his name. He gave them the name of *Ladrone Islands*, or the *Islands of Thieves*, from the thievish disposition of the inhabitants. At the time these islands were discovered by the Europeans, the natives were totally unacquainted with any other coun-

Ladrones.

country besides their own; and having no traditional accounts of their own origin, they imagined that the author of their race was formed of a piece of the rock of Funa, one of their smallest islands. Many things looked upon by us as absolutely necessary to our existence, were utterly unknown to these people. They had no animals of any sort; and would not even have had any idea of them, had it not been for the birds; and even of them they had but one species, somewhat like the turtle-dove, which they never killed for eating, but only tamed them, and taught them to speak. They were much astonished on seeing a horse which a Spanish captain left among them in 1673, and could not for a long time be satisfied with admiring him. But what is most surprising and incredible in their history is, that they were utterly unacquainted with the element of fire, till Magellan, provoked by their repeated thefts, burned one of their villages. When they saw their wooden houses blazing, they first thought that the fire was a beast which fed upon the wood; and some of them who came too near, being burnt, the rest stood at a distance, lest they should be devoured or poisoned by the breathings of this terrible animal.

The inhabitants of the Ladrones are olive-coloured, but not of such a deep dye as those of the Philippine islands; their stature is good, and their limbs well proportioned. Though their food consists entirely of fish, fruits, and roots, yet they are so fat, that to strangers they appear swelled, but this does not render them less nimble and active. They often live to two years or more, yet retain the health and vigour of men of 50. The men go stark naked, but the women are covered. They are not ill-looking, and take great care of their beauty, though their ideas on that subject are very different from ours. They love black teeth and white hair. Hence one of their principal occupations is to keep their teeth black by the help of certain herbs, and to whiten their hair, sprinkling upon it a certain water for this purpose. The women have their hair very long; but the men generally shave it close, except a single lock on the crown of the head, after the manner of the Japanese. Their language much resembles that of the people called *Tagales* in the Philippine islands. It is agreeable to the ear, with a soft and easy pronunciation. One of its chief graces consists in the facility of transposing words, and even all the syllables of one word; and thus furnishing a variety of double meanings, with which these people are greatly delighted. Though plunged in the deepest ignorance, and destitute of every thing valued by the rest of mankind, no nation ever shewed more presumption, or a greater conceit of themselves than these islanders, looking on their own nation as the only wise, sensible, and polished one in the world, and beholding every other people with the greatest contempt. Though they are ignorant of the arts and sciences, yet, like every other nation, they have their fables which serve them for history, and some poems which they greatly admire. A poet is with them a character of the first eminence, and greatly respected.

We neither know at what time, nor from what place the Ladrone islands were first peopled. As Japan lies within six or seven days sail of them, some have been induced to believe, that the first inhabitants of the

Ladrones came from Japan. But from their greater resemblance to the inhabitants of the Philippine islands than to the Japanese, it is more probable that they came from the former than the latter. Formerly, most of the islands were inhabited; and about 90 years ago, the three principle islands, Guam, Tinian, and Rota, are said to have contained 50,000 people; but since that time, Tinian hath been entirely depopulated, and only 200 or 300 Indians left at Rota to cultivate rice for the island of Guam, which alone is inhabited by Europeans, and where the Spaniards have a governor and a garrison: here also the annual Manila ship touches for refreshments in her passage from Acapulco to the Philippines. The island of Tinian afforded an asylum to commodore Anson in 1742; and the masterly manner in which the author of that voyage paints the natural beauties of the country hath given a degree of estimation not only to this island, but to all the rest, which they had not before. Commodore Byron, in 1765, continued nine weeks at Tinian, and anchored in the very spot where the centurion lay; but gives a much less favourable account of this climate and country than the former navigator. The water, he says, is brackish, and full of worms: many of his men were seized with fevers, occasioned by the intense heat; the thermometer, which was kept on board the ship, generally stood at 86°, which is but 10 or 11 degrees less than the heat of the blood at the heart; and had the instrument been ashore, he imagines it would have stood much higher than it did. It was with the greatest difficulty that they could penetrate through the woods; and when they had fortunately killed a bull, and with prodigious labour dragged it through the forests to the beach, it stunk, and was full of fly-blows by the time it reached the shore. The poultry was ill-tasted; and within an hour after it was killed, the flesh became as green as grass, and swarmed with maggots. The wild hogs were very fierce; and so large, that a carcase frequently weighed 200 pounds. Cotton and indigo were found on the island. Captain Wallis continued here a month in 1767, but makes no such complaints.

**LADY.** This title is derived from two Saxon words, which signify *loaf-day*, which words have in time been contracted into the present appellation. It properly belongs only to the daughter of earls, and all of higher rank; but custom has made it a word of complaisance for the wives of knights, and of all eminent women.

As to the original application of this expression, it may be observed, that heretofore it was the fashion for those families, whom God had blessed with affluence, to live constantly at their mansion-houses in the country, and that once a-week, or oftener, the lady of the manor distributed to her poor neighbours, *with her own hands*, a certain quantity of bread; but the practice, which gave rise to this title, is now as little known as the meaning of it: however, it may be from that hospitable custom, that, to this day, the ladies in this kingdom alone serve the meat at their own tables.

**LADY'S Bedstraw.** See GALLIUM.

**LADY'S Mantle.** See ALCHEMILLA.

**LADY'S Smock.** See CARDAMINE.

**LADY'S Slipper.** See CYPRIPEDIUM.

Ladrones,  
Lady.

L. 2. l. y

LADY'S *Traces*. See OPHRYS.

Lagoon.

LADY-*Day*, in law, the 25th of March, being the annunciation of the Holy Virgin. See ANNUNCIATION.

LÆLIUS (Caius), a Roman consul and great orator, surnamed the *Wise*, distinguished himself in Spain in the war against Viriathus the Spanish general. He is highly praised by Cicero, who gives an admirable description of the intimate friendship which subsisted between Lælius and Scipio Africanus the Younger. His eloquence, his modesty, and his abilities, acquired him a great reputation; and he is thought to have assisted Terence in his comedies. He died about 126 B. C.

LAER. See BAMBOCCIO.

LAESTRYGONES, (anc. geog.), an ancient people dwelling in Sicily, together with the Cyclopes; about whose origin and fate Thucydides declares, he has nothing to say. They were also a people of Italy about Formia, of Scythian original, and a race of cannibals, (Pliny); resembling giants rather than men, (Homer).

LAET (John de), a writer in the 17th century, born at Antwerp, was director of the West India company. He acquired great skill in the languages, in history, and geography; and had the management of Elzevir's edition of *A description of most kingdoms in the world*, printed in Latin. He wrote, in French, a *Description of the East Indies*, and other works; and died in 1649.

LÆVINUS (Torrentinus), commonly called *Vander Bekin*, or *Torrentin*, was a native of Ghent, and bred in the university of Louvain. He afterwards made the tour of Italy, where his virtues obtained him the friendship of the most illustrious personages of his time. On his return to the Low Countries; he was made canon of Liege, and vicar-general to Ernest de Baviere, bishop of that see. At length, having executed a successful embassy to Philip II. of Spain, he was rewarded with the bishopric of Antwerp; from whence he was translated to the metropolitan church of Mechlin, and died there in 1595. He founded a college of Jesuits at Louvain, to which he left his library, medals, and curiosities. He wrote several poems that procured him the character of being, after Horace, the prince of the lyric poets.

LÆVIUS, a Latin poet. It is not well known when he lived, but probably he was more ancient than Cicero. He made a poem entitled *Erotopagnia*, i. e. *love-games*. Aulus Gellius quotes two lines of it. Apuleius also quotes six lines from the same poet, but he does not tell from what work he borrowed them. Lævius had also composed a poem intitled *The centaur*, which Festus quotes under the title of *Petrarum*.

LAGAN, or LAGON. See FLOTSOM.

LAGNY, a town of the isle of France, with a famous benedictine abbey. It is seated on the river Marne, in E. Long. 2. 45. N. Lat. 48. 50.

LAGOON ISLAND, one of the new discovered islands in the South Sea, lying in S. Lat. 18. 47. W. Long. 139. 28. It is of an oval form, with a lake in the middle, which occupies much the greatest part of it. The whole island is covered with trees of different growth. It is inhabited by a race of Indians, tall, of

a copper-colour, with long black hair. Their weapons are poles or spikes, which are twice as long as themselves. Their habitations were seen under some clumps of palm-trees, which formed very beautiful groves. This island was discovered by Captain Cook in April 1769.

LAGOPUS, in ornithology. See TETRAO.

LAGOS, a sea-port town of Portugal, in the kingdom of Algarve, with a castle near the sea, where there is a good harbour, and where the English fleets bound to the Straits usually take in fresh water. W. Long. 8. 5. N. Lat. 36. 45.

LAGUNA, or *San Christoval de Laguna*, a considerable town in the island of Teneriff, near a lake of the same name, on the declivity of a hill. It has very handsome buildings, and a fine square. W. Long. 16. 24. N. Lat. 28. 30.

LAGUNES OF VENICE, are marshes or lakes in Italy on which Venice is seated. They communicate with the sea, and are the security of the city. There are about 60 islands in these Lagunes, which together make a bishop's see. Eurano is the most considerable, next to those on which Venice stands.

LAHOLM, a sea-port town of Sweden, in the province of Gothland, and territory of Halland, seated near the Baltic Sea, with a castle and a harbour, in E. Long. 13. 13. N. Lat. 56. 35.

LAHOR, a large town of Aûs, in Indostan, and capital of a province of the same name, and one of the most considerable in the Mogul's dominions. It is of a vast circumference, and contains a great number of mosques, public baths, caravanseras, and pagods. It was the residence of the Great Mogul; but since the removal of the court, the fine palace is going to decay. There is a magnificent walk of shady trees, which runs from this to Agra, that is upwards of 300 miles. Here they have manufactures of cotton-cloths and stuffs of all kinds, and they make very curious carpets. E. Long. 75. 55. N. Lat. 31. 40.

LAINEZ (James), a Spaniard, companion of Ignatius of Loyola, second general of the Jesuits, and a man of a more daring and political character. Having procured from pope Paul IV. the perpetual generalship of the new order of Jesuits, after the death of Ignatius, he got the following privileges ratified by that pontiff, which shew, that he was in fact the founder of the world part of their institution: 1. The right of making all sorts of contracts (without the privacy of the community) vested in the generals and their delegates. 2. That of giving authenticity to all comments and explanations of their constitutions. 3. The power of making new, and altering the old: this opened the door to their bloody political tenets, not to be attributed to Loyola. 4. That of having prisons independent of the secular authority, in which they put to death refractory brethren. Lainez died in 1565, aged 53.

LAIRESSE (Gerard), an eminent Flemish painter, born at Liege in 1640. He received the principal part of his instruction from his father Reiniere de Lairesse, though he is also accounted a disciple of Bartolet. He first settled at Utrecht, where he lived in distressed circumstances; but an accidental recommendation carrying him to Amsterdam, he soon exchanged want and obscurity for affluence and reputation.

Laity,  
Lake.

tion. He was a perfect mastery of history; his designs are distinguished by the grandeur of the composition; and the back-grounds, wherever the subjects required it, are rich in architecture, which is an uncommon circumstance in that country. He had the unhappiness to lose his sight several years before his death, which happened in 1711; so that the treatise on design and colouring, which passes under his name, was not wrote by him, but collected from his observations after he was blind, and published after his death. He had three sons, two of whom were painters; and also three brothers, Ernest, James, and John: Ernest and John painted animals, and James was a flower-painter. He engraved a good deal in aquafortis: his works consist of 256 plates, above half of which were done with his own hand. He wrote an excellent book on the art, which has been translated into English, and printed at London both in 4to and 8vo.

LAITY, the people as distinguished from the clergy; (see CLERGY). The lay part of his Majesty's subjects is divided into three distinct states; the civil, the military, and the maritime. See CIVIL, MILITARY, MARITIME.

LAKE, a collection of waters contained in some cavity in an inland place, of a large extent, surrounded with land, and having no communication with the ocean. Lakes may be divided into four kinds. 1. Such as neither receive nor send forth rivers. 2. Such as emit rivers, without receiving any. 3. Such as receive rivers, without emitting any. And, 4. Such as both receive and send forth rivers. Of the first kind, some are temporary and others perennial. Most of those that are temporary owe their origin to the rain, and the cavity or depression of the place in which they are lodged: thus in India there are several such lakes made by the industry of the natives, of which some are a mile, and some two in circuit; these are surrounded with a stone-wall, and being filled in the rainy months, supply the inhabitants in dry seasons, who live at a great distance from springs or rivers. There are also several of this kind formed by the inundations of the Nile and the Niger; and in Muscovy, Finland, and Lapland, there are many lakes formed, partly by the rains, and partly by the melting of the ice and snow: but most of the perennial lakes, which neither receive nor emit rivers, probably owe their rise to springs at the bottom, by which they are constantly supplied. The second kind of lakes, which emit without receiving rivers, is very numerous. Many rivers flow from these as out of cisterns; where their springs being situated low within a hollow place, first fill the cavity and make it a lake, which not being capacious enough to hold all the water, it overflows and forms a river: of this kind is the Wolga, at the head of the river Wolga; the lake Odium, at the head of the Tanais; the Adæ, from whence one branch of the river Tigris flows; the Ozero, or White lake, in Muscovy, is the source of the river Shakma. The great lake Chaamay, which emits four very large rivers, which water the countries of Siam, Pegu, &c. viz. the Menan, the Asa, the Caipoumo, and the Laquia, &c. The third species of lakes, which receive rivers but emit none, apparently owe their origin to those rivers which, in their progress from their source, fall into some extensive cavity, are collected together,

and form a lake of such dimensions as may lose as much by exhalation as it continually receives from these sources: of this kind is that great lake improperly called the *Caspian Sea*; the lake Asphaltites, also called the *Dead Sea*; the lake of Geneva, and several others. Of the fourth species, which both receive and emit rivers, we reckon three kinds, as the quantity they emit is greater, equal, or less than they receive. If it be greater, it is plain that they must be supplied by springs at the bottom; if less, the surplus of the water is probably spent in exhalations; and if it be equal, their springs just supply what is evaporated by the sun.

Lakes are also divided into those of fresh water, and those of salt. Dr Halley is of opinion, that all great perennial lakes are saline, either in a greater or less degree; and that this saltness increases with time: and on this foundation he proposes a method for determining the age of the world.

Large lakes answer the most valuable purposes in the northern regions, the warm vapours that arise from them moderating the pinching cold of those climates; and what is still a greater advantage, when they are placed in warmer climates at a great distance from the sea, the exhalations raised from them by the sun cause the countries that border upon them to be refreshed with frequent showers, and consequently prevent their being barren deserts.

LAMA, a fynonime of the camelus pacos. See CAMELUS.

LAMA, the sovereign pontiff, or rather god, of the Asiatic Tartars, inhabiting the country of Barantola. The lama is not only adored by the inhabitants of the country, but also by the kings of Tartary, who send him rich presents, and go in pilgrimage to pay him adoration, calling him *lama congiu*, i. e. god, the everlasting father of heaven. He is never to be seen but in a secret place of his palace, amidst a great number of lamps, sitting cross-legged upon a cushion, and adorned all over with gold and precious stones; where, at a distance, they prostrate themselves before him, it not being lawful for any to kiss even his feet. He is called the *great lama*, or *lama of lamas*, that is, *priest of priests*. And to persuade the people that he is immortal, the inferior priests, when he dies, substitute another in his stead, and so continue the cheat from generation to generation. These priests persuade the people, that the lama was raised from death many hundred years ago, that he has lived ever since, and will continue to live for ever.

LAMB, in zoology, the young of the sheep-kind. See OVIS.

A male lamb of the first year is called a *wedder-hog*, and the female a *ewe-hog*; the second year it is called a *wedder*, and the female a *sheave*. If a lamb be sick, mare's milk with water may be given it; and by blowing into the mouth, many have been recovered, after appearing dead. The best season for weaning them is when they are 16 or 18 weeks old, and about Michaelmas. The males should be separated from the females, and such males as are not designed for rams, gelded. "Lamb, (says Dr Cullen), appears a more fibrous kind of meat, and upon that account is less easily soluble than veal. In Scotland, house-lamb is never reared to advantage."

Lama,  
Lamb.

Lamb  
Lambert.

Lambert  
Lamentations.

*Scythian* LAMB, a kind of moss, which grows about the roots of fern in some of the northern parts of Europe and Asia, and sometimes assumes the form of a quadruped. See Plate CLVIII. fig. 8. A particular description of it may be seen in Philof. Transf. N<sup>o</sup> 398.

LAMBECIUS (Peter), born at Hamburg in 1628, was one of the most learned men of his time. He went very young to study in foreign countries, at the expense of his uncle the learned Holstenius. He was chosen professor of history at Hamburg in 1652, and rector of the college of that city in 1660. He had taken his degree of doctor of law in France before. He suffered a thousand vexations in his own country; because his enemies charged him with atheism, and censured his writings bitterly. He married a rich lady, but who was so very covetous, that he left her in disgust within a fortnight. He went to Vienna, and from thence to Rome, where he publicly professed the Catholic religion. He returned to Vienna in 1662, where he was kindly received by the emperor, who appointed him his library-keeper, and afterwards his principal librarian, with the title of *counsellor and historiographer*; in which employment he continued till his death, and gained a great reputation by the works he published, viz. 1. *An Essay on Aulus Gellius*. 2. *The Antiquities of Hamburg*. 3. *Remarks on Codinus's Antiquities of Constantinople*, &c.

LAMBERT of Alchaffenburg, a Benedictine monk, in the 11th century, wrote several works; among which is a history of Germany, from the year 1050 to 1077, which is esteemed.

LAMBERT (John), general of the parliament's forces in the civil wars of the last century, was of a good family, and for some time studied the law in one of the inns of court; but upon the breaking out of the rebellion, went into the parliament-army, where he soon rose to the rank of colonel, and by his conduct and valour performed many eminent services. But when Cromwell seemed inclined to assume the title of king, Lambert opposed it with great vigour, and even refused to take the oath required by the assembly and council to be faithful to the government; on which Cromwell deprived him of his commission, but granted him a pension of 2000 l. a-year. This was an act of prudence rather than of generosity; as he well knew, that such a genius as Lambert's, rendered desperate by poverty, was capable of attempting any thing.

Lambert being now divested of all employment, retired to Wimbleton-house; where turning florist, he had the finest tulips and gilliflowers that could be got for love or money. Yet amidst these amusements he still nourished his ambition: for when Richard Cromwell succeeded his father, he acted so effectually with Fleetwood, Desborough, Vane, Berry, and others, that the new protector was obliged to surrender his authority; and the members of the long-parliament, who had continued sitting till the 20th of April 1653, when Oliver dismissed them, were restored to their seats, and Lambert was immediately appointed one of the council of state, and colonel of a regiment of horse and another of foot. For this service the parliament presented him 1000 l. to buy a jewel; but he distributed it among his officers. This being soon known to the parliament, they concluded that he intended to secure a party in the army. They therefore

courteously invited him to come to London; but resolved, as soon as he should arrive, to secure him from doing any farther harm. Lambert, apprehensive of this, delayed his return, and even refused to resign his commission when it was demanded of him and of eight of the other leading officers; and, marching up to London with his army, dislodged the parliament by force in October 1659. He was then appointed, by a council of the officers, major-general of the army, and one of the new council for the management of public affairs, and sent to command the forces in the north. But general Monk marching from Scotland into England to support the parliament, against which Lambert had acted with such violence, the latter, being deserted by his army, was obliged to submit to the parliament, and by their order was committed prisoner to the tower; whence escaping, he soon appeared in arms with four troops under his command, but was defeated and taken prisoner by colonel Ingoldby.

At the Restoration he was particularly excepted out of the act of indemnity. Being brought to his trial on the 4th of June 1662, for levying war against the king, this daring general behaved with more submission than the meanest of his fellow-prisoners, and was by his majesty's favour reprieved at the bar, and confined during his life in the island of Guernsey.

LAMBERT (Anna Theresia de Marguenat de Courcelles, marchioness of), an elegant moral writer, was the only daughter of Stephen Marguenat lord of Courcelles. In 1666 she married Henry de Lambert, who at his death was lieutenant-general of the army; and she afterwards remained a widow with a son and a daughter, whom she educated with great care. Her house was a kind of academy, to which persons of distinguished abilities regularly resorted. She died at Paris in 1733, aged 86. Her works, which are written with much taste, judgement, and delicacy, are printed in two volumes. The advice of a mother to her son and daughter are particularly esteemed.

LAMBIN (Dennis), an eminent classical commentator, was born at Montreuil-sur-Mer, in Picardy, and acquired great skill in polite literature. He lived for a long time at Rome; and at his return to Paris was made royal professor of the Greek language. He died in 1572, aged 56, of pure grief at the death of his friend Ramus, who was murdered at the massacre on St Bartholomew's day. He wrote commentaries on Plautus, Lucretius, Cicero, and Horace, and other works. His commentary on Horace is more particularly esteemed.

LAMELLÆ, in natural history, denotes very thin plates, such as the scales of fishes are composed of.

LAMENTATIONS, a canonical book of the Old Testament, written by the prophet Jeremiah. The two first chapters of this book are employed in describing the calamities of the siege of Jerusalem. In the third, the author deplores the persecutions he himself had suffered. The fourth turns upon the desolation of the city and temple, and the misfortune of Zedekiah. The fifth chapter is a prayer for the Jews in their dispersion and captivity; and, at the end of all, he speaks of the cruelty of the Edomites, who had insulted Jerusalem in her misery. The first four chapters of the Lamentations are an abecedary, every verse or couplet beginning with one of the letters of the He-

Lamie  
 Lamp.

brew alphabet, in the alphabetical order.

LAMIE, *Lamie*, among the ancients, a kind of demons, or evil spirits, who, under the form of beautiful women, are said to have devoured children.

Horace makes mention of them in his Art of Poetry. Some authors call them *lamie*, à *laniando*. Philostratus says, they are also called *larvæ*, or *lemures*, as if they were all the same thing. Borchart will have the word to be *Phœnician*, and derives it from פֶּנִּי "to devour;" alleging the fable of the lamie came from Libya.

LAMINÆ, in physiology, thin plates, or tables, whereof any thing consists; particularly the human skull, which are two, the one laid over the other.

LAMIUM, *Dead-Nettle*; a genus of the gymnospermia order, belonging to the didynamia class of plants. There are eight species; of which only two, viz. the album, white archangel, or dead-nettle, and the purpureum or red archangel, are remarkable; and that only because their young leaves are boiled and eaten in some places like greens. The first grows frequently under hedges and in waste places; the second is very common in gardens and corn-fields. None of the species are cultivated except merely for the sake of variety.

LAMMAS-DAY, the first of August; so called, as some will have it, because lambs then grow out of season, as being too big. Others derive it from a Saxon word, signifying "loaf-mass," because on that day our fore-fathers made an offering of bread made with new wheat.

On this day the tenants who formerly held lands of the cathedral church in York, were bound by their tenure to bring a lamb alive into the church at high-mass.

LA MOIGNON (Chretien Francis de) marquis of Baviile, and president of the parliament of Paris, was born in 1644. His father would not trust the education of his son to another, but took it upon himself, and entered into the minutest particulars of his first studies: the love of letters and a solid taste were the fruits the scholar reaped from this valuable education. He learned rhetoric in the Jesuits college, made the tour of England and Holland, and returned home the admiration of those meetings regularly held by persons of the first merit, at his father's house. The several branches of literature were however only his amusement: the law was his real employ; and the eloquence of the bar at Paris owes its reformation from bombast and affected erudition, to the plain and noble pleadings of M. Lamoignon. He was appointed the king's advocate general in 1673; which he discharged until 1698, when the presidentship of the parliament was conferred on him. This post he held nine years, when he was allowed to resign in favour of his eldest son: he was chosen president of the royal academy of inscriptions in 1705. The only work he suffered to see the light was his *Pleader*, which is a monument of his eloquence and inclination to polite letters. He died in 1709.

LAMP, a vessel containing oil, with a lighted wick.

Dr St Clair, in the *Philos. Trans.* n° 245, gives the description of an improvement on the common lamp. He proposes that it should be made two or three inches deep, with a pipe coming from the bottom almost as

high as the top of the vessel. Let it be filled so high with water, that it may cover the hole of the pipe at the bottom, that the oil may not get in at the pipe and so be lost. Then let the oil be poured in, so as to fill the vessel almost brim-full; and to the vessel must be adapted a cover having as many holes as there are to be wicks. When the vessel is filled and the wicks lighted, if water falls in by drops at the pipe, it will always keep the oil at the same height or very near it; the weight of the water being to that of the oil as 20 $\frac{1}{2}$  to 19, which in two or three inches makes no great difference. If the water runs faster than the oil wastes, it will only run over at the top of the pipe, and what does not run over will come under the oil, and keep it at the same height.

From experiments made in order to ascertain the expence of burning chamber-oil in lamps, it appears, that a taper-lamp, with eight threads of cotton in the wick, consumes in one hour  $1\frac{1}{2}$  oz. of spermaceti oil, at 2s. 6d. per gallon; so that the expence of burning 12 hours is 4.57 farthings. This lamp gives as good a light as the candles of eight and ten in the pound; it seldom wants snuffing, and casts a strong and steady light. A taper, chamber, or watch lamp, with four ordinary threads of cotton in the wick, consumes 0.1664 oz. of spermaceti oil in one hour; the oil at 2s. 6d. per gallon, makes the expence of burning 12 hours only 2.34 farthings.

*Perpetual LAMPS.* The testimonies of Pliny, St Austin, and others, have led many to believe that the ancients had the invention of perpetual lamps; and some moderns have attempted to find out the secret, but hitherto in vain. Indeed it seems no easy matter to find out either a perpetual wick, or a perpetual oil. The curious may read Dr Plot's conjectures on the subject in the *Philos. Trans.* n° 166; or in Lowthorp's abridgement, vol. iii. p. 636. But few, we believe, will give themselves the trouble of searching for the secret, when they consider, that the credulity of Pliny and of St Austin was such, that their testimony does not seem a sufficient inducement to us to believe that a lamp was ever formed to burn 1500 or 1000 years: much less is it credible that the ancients had the secret of making one burn for ever.

*Rolling-LAMP*, a machine AB, with two moveable circles DE, FG, within it; whose common centre of motion and gravity is at K, where their axis of motion cross one another. If the lamp KC, made pretty heavy and moveable about its axis HI, and whose centre of gravity is at C, be fitted within the inner circle, the common centre of gravity of the whole machine will fall between K and C; and by reason of the pivots A, B, D, E, H, I, will be always at liberty to descend: hence, though the whole machine be rolled along the ground, or moved in any manner, the flame will always be uppermost, and the oil cannot spill.

It is in this manner they hang the compass at sea; and thus should all the moon-lanterns be made, that are carried before coaches, chaises, and the like.

LAMP-Black, among colourmen. See COLOUR-Making, n° 17, 18.—Substances painted with lamp-black and oil, are found to resist the effects of electricity to a surprising degree; so that in many cases even lightning itself seems to have been repelled by them. See LIGHTNING; THUNDER; CHEMISTRY, n° 112. and ELEC-

Lamp.

Lampadary ELECTRICITY, n° 112.

LAMPADARY, an officer in the ancient church of Constantinople, so called from his employment, which was to take care of the lamps, and to carry a taper before the emperor or patriarch when they went to church or in procession.

LAMPAS, in farrery. See there, § xxiv.

LAMPREY. See PETROMYZON.

LAMPRIIDIUS (Elius), a Latin historian, who lived under the emperors Dioclesian and Constantine the Great. We have, of his writing, the lives of four emperors, Antoninus, Commodus, Diadumenus, and Heliogabalus. Some attribute the life of Alexander Severus to him; but the MS in the palatine library ascribes it to Spartian.

LAMPRIIDIUS (Benedict), of Cremona, a celebrated Latin poet of the 16th century. He taught Greek and Latin at Rome and at Padua, until he was invited to Mantua by Frederic Gonzaga to undertake the tuition of his son. We have epigrams and lyric verses of this writer, both in Greek and Latin, which were printed separately, as well as among the *Delicia* of the Italian poets.

LAMPSCACUS, LAMPSCACUM, (anc. geog.) a considerable city of Mysia; more anciently called *Pityea*, (Homer), because abounding in pine-trees, a circumstance confirmed by Pliny; situate at the north end, or entrance of the Hellespont, into the Propontis, with a commodious harbour, opposite to Callipolis in the Thracian Chersonesus. It was assigned by Artaxerxes to Themistocles, for furnishing his table with wine, in which the country abounded. It was saved from the ruin threatened by Alexander because in the interest of Persia, by the address of Anaximenes the historian, sent by his fellow-citizens to avert the king's displeasure; who hearing of it, solemnly declared he would do the very reverse of Anaximenes's request, who therefore begged the king utterly to destroy it, which he could not do because of his oath. *Lampscacus* the epithet, denoting *lascivus*, the character of the people: still called *Lampscacus*. E. Long. 28°. N. Lat. 40. 12.

LAMY, or LAMI, (Bernard), was born at Mons in 1640, and studied there under the fathers of the oratory; with whose way of life he was so pleased, that he went to Paris in 1658, and entered into the institution. He had a great taste for the sciences, and studied them all; he entered into the priesthood in 1667, and taught philosophy at Saumur and Angiers; which latter place he was obliged to quit by an order procured from court for adopting the new philosophy instead of that of Aristotle. In 1676, he went to Grenoble, where cardinal Camus was then bishop; who conceived such an esteem for him, that he retained him near his person, and derived considerable services from him in the government of his diocese. After continuing many years there, he went to reside at Rouen, where he died in 1715. He wrote several scientific works, besides others in divinity.

LANCARIM SPRING, the name of a medicated water of Glamorganshire. It has its name from a town near which it rises; and has been very long famous in the place for the cure of the king's evil. The body of water is about an ell broad, and runs between two hills covered with wood. About 12 yards from this spring the rill falls from a rock of about eight or nine feet

high, with a considerable noise. The spring is very Lancashire; clear, and rises out of a pure white marble. The cures that have been performed there, are proofs of a real power in the water; but there is some question whether the water, or its motion and coldness, does the good; for the people who come for relief always drink of the spring, and bathe the part afterward in the fall below. It is generally supposed, that the limestone rocks communicate a virtue to it by which it cures internally; but it has been often found, that the holding a limb disordered with the evil in the strong current of a mill-tail has cured it, and there is the same advantage in the fall of this water.

LANCASHIRE, a large maritime province of England, washed by the Irish sea on the west, bordering on the north with part of Cumberland and Westmoreland; bounded on the east by the West Riding of Yorkshire, and on the west by Cheshire; extending 45 miles in length from north to south, and 32 miles in breadth from east to west; comprehending six hundreds, 60 parishes, 27 market-towns, and about 240000 inhabitants.

The eastern parts of the province are rocky, and in the northern districts we see many single mountains remarkably high, such as Ingleborough-hill, Cloughbo-hill, Pendle-hill, and Longridge-hill. Nor is there any want of wood in this country, either for timber or fuel; witness Wierdale forest and Bowland forest to the northward, and Simon's wood in the southern part of Lancashire.

This country is well watered with rivers and lakes. Among the former we number the Mersey, the Ribble, the Wier, the Lon, the Ken, and the Irke. The Mersey springs among the mountains of Derbyshire, is swelled by several streams, winds along the borders of Lancashire, which it divides from Cheshire, and runs into the sea at Liverpool. The Ribble, rising in Yorkshire, enters this county at Clithero, washes the town of Preston, and having received the smaller streams of the Hadder, the Whalley, the Darwent, and the Lea, disembogues itself into the Irish sea at Letham. The Wier is a continuation of the Calder, which derives its source from the forest of Wierdale, in the northern part of the county, and, being augmented by divers smaller streams, runs into the sea at Cockerham. The Irke is an inconsiderable rivulet, that forms the beginning of the Irwel and Mersey, which are its continuations; and is noted for producing the fattest eels in England.

Among the lakes or meres of Lancashire, we reckon the Winander-mere, and the Kenington-mere, which, tho' neither so large nor so well stored with fish, yet affords plenty of excellent char. There was on the fourth side of the Ribble another lake called *Marston*, several miles in circumference, which is now drained, and converted into pasture-ground. In this operation, the workmen found a great quantity of fish, together with eight canoes, resembling those of America, supposed to have been used by the ancient British fishermen. Besides these meres or lakes, this county abounds with morasses and mosses, from which the inhabitants dig excellent peat or turf for fuel, as well as marble for manuring the ground, and trunks of old fir-trees, supposed to have lain there since the general deluge. Some of these are so impregnated with turpentine, that, when divided into

Lancashire. to splinters, they burn like candles, and are used for that purpose by the common people. There is a great variety of mineral waters in this county, some periodical springs, and one instance of a violent eruption of water at Kirky in Fournells. The most remarkable chalybeate spaws are those of Latham, Wigan, Stockport, Burnley, Bolton, Plumpton, Middleton, Strangeways, Lancaster, Larbrick, and Chorley. At Ancfliff, in the neighbourhood of Wigan, is a fountain called the *Burning Well*, from whence a bituminous vapour exhales, which being set on fire by a candle burns like brandy, so as to produce a heat that will boil eggs to a hard consistence, while the water itself retains its original coldness\*. There is at Barton a fountain of salt-water, so strongly impregnated with the mineral, as to yield six times as much as can be extracted from the same quantity of sea-water. At Rogham, in Fournells, there is a purging saline fountain; and in the neighbourhood of Raflal, where the ground is frequently overflowed by the sea, a stream descends from Haggar-hills, which, in the space of seven years, is said to convert the marle into a hard freestone fit for building. The air of Lancashire is pure, healthy, and agreeable, except among the fens and on the sea-shore, where the atmosphere is loaded with putrid exhalations producing malignant and intermitting fevers, scurvy, rheumatism, dropsy, and consumption. The soil is various in different parts of the county, poor and rocky on the hills, fat and fertile in the valleys and champaign country. The colour of the peat is white, grey, or black, according to the nature of the composition and the degree of putrefaction which the ingredients have undergone. There is a bituminous earth about Ormirkirk, that smells like the oil of amber, and indeed yields an oil of the same nature, both in its scent and medicinal effects, which moreover reduces raw flesh to the consistence of mummy: this earth burns like a torch, and is used as such by the country people. The metals and minerals of this county consist of lead, iron, copper, antimony, black lead, lapis calaminaris, spar, green vitriol, allum, sulphur, pyrites, freestone, and pit and cannel coal.

The level country produces plenty of wheat and barley, and the skirts of the hills yield good harvests of excellent oats: very good hemp is raised in divers parts of the province; and the pasture which grows in the valley is so peculiarly rich, that the cattle which feed upon it are much larger and fatter than in any other part of England. There is not any part of the world better supplied than Lancashire with provisions of all kinds at a very reasonable rate; such as beef, veal, mutton, lamb, pork, poultry, and game of all sorts, caught upon the moors, heaths, and commons, in the lilly part of the shire. Besides the sea-fowl common to the shires of England, such as ducks, easterlings, teal, and plover, many uncommon birds are observed on the coast of Lancashire, the sea-crow, variegated with blue and black, the puffin, the cormorant, the curlew, the razor-bill, the copped wren, the red-thanks, the swan, the tropic bird, the king's-fisher, &c.

Lancashire was erected into a county-palatine by Edward III. who conferred it as an appenage on his son John of Ghaut, thence called *duke of Lancaster*: but the duchy contained lands that are not in Lanca-

shire, and, among other demefnes, the palace of the Savoy, and all that district in London, which indeed belong to it at this day. The revenues of this duchy are administered by a court which sits at Westminster, and a chancery-court at Preston, which has a seal distinct from that of the county-palatine. The title of *Lancaster* distinguished the posterity of John of Ghaut from those of his brother, who succeeded to the duchy of York, in their long and bloody contest for the crown of England.—Lancashire sends two members to parliament for the county; and 12 for the six boroughs of Lancaster, Preston, Newton, Wigan, Clithero, and Liverpool.

LANCASTER, the capital of the county of Lancashire in England, is pleasantly situated on the fourth side of the river Lun, over which there is a handsome stone-bridge supported by five arches. It is an ancient town, and is supposed to have been the *Longovicum* of the Romans. It contains several good streets with well-built houses; but has only one parish-church, which is large and handsome, and is seated on the side of a high hill, on the top of which stands the castle that is now made use of as a prison. It is a place of no great trade, but is a corporation, and sends two members to parliament. The chief ornaments of the town are the church, castle, bridge, and town-hall. W. Long. 2. 44. N. Lat. 54. 5.

LANCE, in ichthyology. See AMMODYTES.

LANCEOLATED LEAF. See BOTANY, p. 1296.

LANCET, a chirurgial instrument, sharp-pointed and two-edged, chiefly used for opening veins in the operation of phlebotomy or bleeding; also for laying open abscesses, tumours, &c.

LANCH, a peculiar sort of long boat, used by the French, Spanish, and Italian shipping, and in general by those of other European nations, when employed in voyaging in the Mediterranean sea.

A launch is proportionally longer, lower, and more flat-bottomed than the long-boat; it is by consequence less fit for sailing, but better calculated for rowing and approaching a flat shore. Its principal superiority to the long-boat, however, consists in being, by its construction, much fitter to under-run the cable; which is a very necessary employment in the harbours of the Levant sea, where the cables of different ships are fastened across each other, and frequently render this exercise extremely necessary.

LANCH, is also the movement by which a ship or boat descends from the shore, either when she is at first built, or at any time afterwards.

To facilitate the operation of lanching, and prevent any interruption therein, the ship is supported by two strong platforms, laid with a gradual inclination to the water, on the opposite sides of her keel, to which they are parallel. Upon the surface of this declivity are placed two corresponding ranges of planks, which compose the base of a frame called the *cradle*, whose upper-part envelopes the ship's bottom, whereto it is securely attached. Thus the lower surface of the cradle, conforming exactly to that of the frame below, lies flat upon it, lengthways, under the opposite sides of the ship's bottom; and as the former is intended to slide downwards upon the latter, carrying the ship along with it, the planes or faces of both are well daubed with soap and tallow.

\* See  
BURNING  
Well.

Lancercota  
||  
Lancifi.

The necessary preparations for the lanch being made, all the blocks and wedges, by which the ship was formerly supported, are driven out from under her keel, till her whole weight gradually subsides upon the platforms above described, which are accordingly called the *ways*. The shores and stanchions, by which she is retained upon the rocks till the period approaches for lanching, are at length cut away, and the screws applied to move her, if necessary. The motion usually begins on the instant when the shores are cut, and the ship slides downward along the ways, which are generally prolonged under the surface of the water, to a sufficient depth to float her as soon as she arrives at the farthest end thereof.

When a ship is to be lanchcd, the ensign, jack, and pendant, are always hoisted, the last being displayed from a staff erected in the middle of the ship.

Ships of the first rate are commonly constructed in dry docks, and afterwards floated out, by throwing open the float-gates, and suffering the tide to enter, as soon as they are finished.

LANCEROTA, one of the Canary islands, subject to Spain, and situated in W. Long. 13. 5. N. Lat. 28. 40. It is about 32 miles in length and 22 in breadth. The ancient inhabitants were negroes, very strong, active, and swift of foot. There is a ridge of hills runs quite through it, on which are fed a good number of sheep and goats. They have but few black cattle, still fewer camels, and a very few small horses. The valleys are dry and sandy, yet they produce a small quantity of wheat and barley. This island was first discovered in 1417. In 1596, it was taken by the English under the command of the earl of Cumberland; after which it was better fortified than before. There is in this island a city called also *Lancercota*, which, at the time the earl of Cumberland was there, consisted only of about 100 houses, all poor buildings, generally of one story, and covered with reeds or straw laid upon a few rafters, and over all a coat of dirt hardened by the sun. There was also a church which had no windows in it, and was supplied with light only by the door.

LANCIANO, a considerable town of Italy, in the Kingdom of Naples, and in the Hiiter Abruzzo, with an archbishop's see; famous for its fairs which are held in July and August. It is seated on the river Feltrino near that of Sangor. E. Long. 15. 5. N. Lat. 42. 12.

LANCISI (John Marca), an eminent Italian physician, was born at Rome in 1654. From his earliest years he had a turn to natural history; and studied botany, chemistry, anatomy, and medicine, with great vigour. In 1688, Pope Innocent XI. appointed him his physician and private chamberlain, notwithstanding his youth; and cardinal Altieri Camerlinga made him his vicar for the installation of doctors in physic, which Pope Clement XI. gave him as long as he lived, as well as continued to him the appointments conferred on him by his predecessor. He died in 1720, after giving his fine library of more than 20,000 volumes to the hospital of the Holy Ghost, for the use of the public. This noble benefaction was opened in 1716, in the presence of the pope and most of the cardinals. He wrote many works which are esteemed the principal of which were collected toge-

ther, and printed at Geneva in 1718, in two volumes quarto.

LANCRET (Nicholas), a French painter born at Paris in 1690. He was the disciple of Watteau and Gillot, and painted conversations. He was indefatigable in his profession, executed with great truth after Nature, grouped his figures well, and handled a light pencil. He died in 1743.

LANCRINCK (Proper Henry), a painter of considerable note, born in 1628, and educated in the school at Antwerp. He studied principally after Titian and Salvator Rosa; and met with encouragement in England suitable to his merit. His landscapes shew a good invention, good colouring and harmony: they are chiefly of rough rude country, with broken ground and uncommon scenery. He gave way too much to pleasure, and died in 1692.

LAND, in a general sense, denotes *terra firma*, as distinguished from *sea*.

LAND, in a limited sense, denotes arable ground. See AGRICULTURE.

LAND, in the sea-language, makes part of several compound terms; thus, *land-laid*, or, *to lay the land*, is jult to lose sight of it. *Land-locked*, is when land lies all round the ship, so that no point of the compass is open to the sea. If she is at anchor in such a place, she is said to ride *land-locked*, and is therefore concluded to ride safe from the violence of the winds and tides. *Land-mark*, any mountain, rock, steeple, tree, &c. that may serve to make the land known at sea. *Land is shut in*, a term used to signify that another point of land hinders the sight of that from which the ship came. *Land-to*, or the ship *lies land-to*; that is, she is so far from shore, that it can only jult be discerned. *Land-turn* is a wind that in almost all hot countries blows at certain times from the shore in the night. *To set the land*; that is, to see by the compass how it bears.

LAND-TAX, one of the annual taxes raised upon the subject. See TAX.

The land-tax, in its modern shape, has superseded all the former methods of rating either property, or persons in respect of their property, whether by tenths or fifteenths, subsidies on land, hydages, scutages, or talliages; a short explication of which will, however, greatly assist us in understanding our ancient laws and history.

Tenths, and fifteenths, were temporary aids issuing out of personal property, and granted to the king by parliament. They were formerly the real tenth or fifteenth part of all the moveables belonging to the subject; when such moveables, or personal estates, were a very different and a much less considerable thing than what they usually are at this day. Tenths are said to have been first granted under Henry II. who took advantage of the fashionable zeal for crusades to introduce this new taxation, in order to defray the expence of a pious expedition to Palestine, which he really or seemingly had projected against Saladin emperor of the Saracens, whence it was originally denominated the *Saladin tenth*. But afterwards fifteenths were more usually granted than tenths. Originally the amount of these taxes was uncertain, being levied by assessments new-made at every fresh grant of the commons, a commission for which is preserved.

Lancert  
||  
Land.

served by Matthew Paris: but it was at length reduced to a certainty in the eighth year of Edward III. when, by virtue of the king's commission, new taxations were made of every township, borough, and city in the kingdom, and recorded in the exchequer; which rate was, at the time, the fifteenth part of the value of every township, the whole amounting to about 29000 l. and therefore it fill kept up the name of a *fifteenth*, when, by the alteration of the value of money and the increase of personal property, things came to be in a very different situation. So that when, of later years, the commons granted the king a *fifteenth*, every parish in England immediately knew their proportion of it; that is, the same identical sum that was assessed by the same aid in the eighth of Edward III.; and then raised it by a rate among themselves, and returned it into the royal exchequer.

The other ancient levies were in the nature of a modern land-tax: for we may trace up the original of that charge as high as to the introduction of our military tenures; when every tenant of a knight's fee was bound, if called upon, to attend the king in his army for 40 days in every year. But this personal attendance growing troublesome in many respects, the tenants found means of compounding for it, by first sending others in their stead, and in process of time by making a pecuniary satisfaction to the crown in lieu of it. This pecuniary satisfaction at last came to be levied by assessments, at so much for every knight's fee, under the name of *scutages*; which appear to have been levied for the first time in the fifth year of Henry II. on account of his expedition to Toulouse, and were then (Sir Wm. Blackstone apprehends) mere arbitrary compositions, as the king and the subject could agree. But this precedent being afterwards abused into a means of oppression, (by levying *scutages* on the landholders by the king's authority only, whenever our kings went to war, in order to hire mercenary troops and pay their contingent expences) it became thereupon a matter of national complaint; and king John was obliged to promise in his *magna carta*, that no *scutage* should be imposed without the consent of the common council of the realm.

Of the same nature with *scutages* upon knights-fees were the assessments of *hytage* upon all other lands, and of *talliage* upon cities and burghs. But they all gradually fell into disuse, upon the introduction of subsidies, about the time of king Richard II. and king Henry IV. These were a tax, not immediately imposed upon property, but upon persons in respect of their reputed estates, after the nominal rate of 4 s. in the pound for lands, and 2 s. 6 d. for goods; and for those of aliens in a double proportion. But this assessment was also made according to an ancient valuation; wherein the computation was so very moderate, and the rental of the kingdom was supposed to be so exceeding low, that one subsidy of this sort did not, according to Sir Edward Coke, amount to more than 70,000 l. whereas a modern land-tax at the same rate produces two millions. It was anciently the rule never to grant more than one subsidy and two fifteenths at a time: but this rule was broke through for the first time on a very pressing occasion, the Spanish invasion in 1588; when the parliament gave queen Elizabeth two subsidies and four fifteenths. Afterwards, as money sunk

in value, more subsidies were given; and we have an instance, in the first parliament of 1640, of the king's desiring 12 subsidies of the commons, to be levied in three years; which was looked upon as a startling proposal: though lord Clarendon tells us, that the speaker, serjeant Glanville, made it manifest to the house, how very inconsiderable a sum 12 subsidies amounted to, by telling them he had computed what he was to pay for them; and when he named the sum, he being known to be possessed of a great estate, it seemed not worth any farther deliberation. And, indeed, upon calculation, we shall find, that the total amount of these 12 subsidies, to be raised in three years, is less than what is now raised in one year by a land-tax of 2 s. in the pound.

The grant of *scutages*, *talliaiges*, or subsidies by the commons did not extend to spiritual preferments; those being usually taxed at the same time by the clergy themselves in convocation: which grants of the clergy were confirmed in parliament; otherwise they were illegal, and not binding; as the same noble writer observes of the subsidies granted by the convocation, which continued sitting after the dissolution of the first parliament in 1640. A subsidy granted by the clergy was after the rate of 4 s. in the pound, according to the valuation of their livings in the king's books; and amounted, Sir Edward Coke tells us, to about 20,000 l. While this custom continued, convocations were wont to sit as frequently as parliaments: but the last subsidies, thus given by the clergy, were those confirmed by statute 15 Car. II. c. 10. since which another method of taxation has generally prevailed, which takes in the clergy as well as the laity: in recompense for which, the beneficed clergy have from that period been allowed to vote at the election of knights of the shire; and thenceforward also the practice of giving ecclesiastical subsidies hath fallen into total disuse.

The lay-subsidy was usually raised by commissioners appointed by the crown, or the great officers of state: and therefore in the beginning of the civil wars between Charles I. and his parliament, the latter, having no other sufficient revenue to support themselves and their measures, introduced the practice of laying weekly and monthly assessments of a specific sum upon the several counties of the kingdom; to be levied by a pound-rate on lands and personal estates: which were occasionally continued during the whole usurpation, sometimes at the rate of 120,000 l. a month, sometimes at inferior rates. After the Restoration the ancient method of granting subsidies, instead of such monthly assessments, was twice, and twice only, renewed; viz. in 1663, when four subsidies were granted by the temporality, and four by the clergy; and in 1670, when 800,000 l. was raised by way of subsidy, which was the last time of raising supplies in that manner. For, the monthly assessments being now established by custom, being raised by commissioners named by parliament, and producing a more certain revenue; from that time forwards we hear no more of subsidies, but occasional assessments were granted as the national emergencies required. These periodical assessments, the subsidies which preceded them, and the more ancient *scutage*, *hytage*, and *talliage*, were to all intents and purposes a land-tax; and the assessments were

**Landaff** were sometimes expressly called so. Yet a popular opinion has prevailed, that the land-tax was first introduced in the reign of king William III.; because in the year 1692 a new assessment or valuation of estates was made throughout the kingdom: which, though by no means a perfect one, had this effect, that a supply of 500,000*l.* was equal to 1*s.* in the pound of the value of estates given in. And, according to this enhanced valuation, from the year 1693 to the present, a period of above 80 years, the land-tax has continued an annual charge upon the subject; above half the time at 4*s.* in the pound, sometimes at 3*s.* sometimes at 2*s.* twice at 1*s.* but without any total intermission. The medium has been 3*s.* 3*d.* in the pound; being equivalent to 23 ancient subsidies, and amounting annually to more than a million and a half of money. The method of raising it is by charging a particular sum upon each county, according to the valuation given in, A. D. 1692; and this sum is assessed and raised upon individuals (their personal estates, as well as real, being liable thereto) by commissioners appointed in the act, being the principal land-holders in the county, and their officers.

**LANDAFF**, a town or village of Glamorganshire in South-Wales, with a bishop's see, and on that account has the title of a *city*. It is seated upon an ascent on the river Taff, or Tave, near Cardiff; but the cathedral stands on a low ground, and is a large, stately building. W. Long. 3. 20. N. Lat. 51. 33.

**LANDAU**, an ancient, handsome, and very strong town of France, in Lower Alsace. It was formerly imperial, and belonged to Germany, till the treaty of Munster, when it was given up to France. It is seated on the river Zurich, in a pleasant fertile country. E. Long. 8. 12. N. Lat. 49. 12.

**LANDEN**, a town of the Austrian Netherlands, in Brabant, famous for a battle gained over the French by the allies, in July 1693, when 20,000 men were killed. It is seated on the river Beck, in E. Long. 5. 5. N. Lat. 52. 45.

**LANDERNEAU**, a town of France, in Lower Bretagne, seated on the river Elboro, 20 miles east of Brest. In an inn here is a well which ebbs and flows like the sea, but at contrary times. E. Long. 4. 13. N. Lat. 48. 25.

**LANDRECY**, a town of the French Netherlands, in Hainault, ceded to France by the treaty of the Pyrenees, and is now very well fortified. It was besieged by prince Eugene in 1712, but to no purpose. It is seated on a plain, on the river Sambré, in E. Long. 3. 47. N. Lat. 50. 4.

**LANDGRAVE**, the German name for a count or earl, that has the government of a province, county, or large tract of land.

**LANDGRAVIATE**, or **LANDGRAVATE**, the office, authority, jurisdiction, or territory of a landgrave.

**LANDSCAPE**, See **LANDSKIP**.

**LANDSCROON**, a sea-port town of Sweden, in South Gothland, and territory of Schonen, seated on the Baltic Sea, within the Sound, 22 miles north of Copenhagen. E. Long. 14. 20. N. Lat. 55. 42.

**LANDSDOWN**, a place in Somersetshire, near Bath, with a fair, on October 10. for cattle and

cheese.

**LANDSHUT**, a strong town of Germany, in Lower Bavaria, with a strong castle, on an adjacent hill. It is seated on the river Iser, in E. Long. 1. 15. N. Lat. 48. 23. There is another small town of the same name in Silesia, and in the duchy of Schweidnitz, seated on the river Zieder, which falls into the Bauber; and there is also another in Moravia, seated on the river Morave, on the confines of Hungary and Austria.

**LANDSKIP**, or **LANDSCAPE**, in painting, the view or prospect of a country extended as far as the eye will reach. See **PAINTING**, n<sup>o</sup> 11. and 22.; and **DRAWING**, sect. 10.

**LANERK-SHIRE**, a county of Scotland, called also *Clydeedale*, from the river Clyde, by which it is watered. It stretches 40 miles in length from south-east to north-west, and 24 at its utmost breadth. It is bounded on the south-east and south, by Annandale and Dumfriesshire; on the north-west and north, by Renfrewshire and Lennox; on the east and north-east, by Linlithgowshire and Stirlingshire; and on the south-east, by part of Midlothian. It is divided into two districts, called the *upper* and *nether ward*; the first, which is roughened with hills and barren heaths, may be denominated the *shire of Lanerk*, the other be distinguished as the *barony of Glasgow*. The Clyde derives its source in the upper ward from Erriack-hill, which likewise gives rise to the Tweed and the Annan; and these three rivers pursue different courses. The Clyde falls into the Deucalionian sea; the Annan discharges itself into Solway Frith; and the Tweed runs into the German ocean. The country of Clydesdale, though in some places barren, mountainous, and embrowned with heath, is in general pleasant and fertile, exhibiting intermingled landscapes of wood and water, hill and valley. Even the naked mountains are rich in minerals, producing abundance of lead-ore, impregnated with a large proportion of silver. Such are the mines belonging to the duke of Queensberry and the earl of Hopeton, at the lead-hills washed by the rivulet of Wanlock, which employ some thousands of hands, and enrich the proprietors. On the sides of the Wanlock, among the sand and soil swept down from the mountains by torrents, the labourers find often small pieces of pure virgin gold; certain signs that there must be a gold-mine in that neighbourhood. Little bits and particles of the same precious metal have been found in Crawford-muir, together with large pieces of lapis lazuli. In the reign of James VI. Cornelius, a German alchemist, found a gold-mine at Crawford-John in this county, from whence, in thirty days, he sent half a stone weight of pure metal to the mint at Edinburgh. Clydesdale is for the most part a corn-country, abounding with oats, barley, rye, and producing a considerable quantity of wheat; while the hilly parts afford excellent pasturage and plenty of game. It yields also great store of freestone, limestone, excellent coal, together with peat and turf for fuel. It is adorned with a great number of agreeable seats: nor is it deficient in Roman antiquities; for it is penetrated from one end to the other by a Roman causeway or military way, called *Watling-street*, running from Grukstone to the borders of Renfrew. Clydesdale and Lanerk give the titles of *marguis* and

Landhuut  
||  
Lanerk.

Lanerk  
||  
Langbaine

*earl* to the duke of Hamilton, whose fortune and influence lie chiefly in this province, which is noted for the number of its gentlemen-landholders. Clydesdale is very populous, inhabited by lowlanders, who profess the Presbyterian religion, in which they have signalized their zeal even to a degree of fanaticism. The shire being an inland country, the common people chiefly employ themselves in farming, breeding sheep and cattle, and in the linen manufacture. Lanerk, the county-town, is a royal burrough, and seat of a presbytery; but in other respects thinly inhabited, and of little importance. It stands upon the banks of the Clyde, over which there is a stone-bridge built at a great expence by the inhabitants. At the distance of a few miles from the town, the river tumbles over a precipice forty feet high, producing a cataract that roars with a hideous noise, deafening those who live in its neighbourhood. Below the town, the Clyde is increased by the small river Douglas, which waters a district called *Douglasdale*, deriving this appellation from the noble family of Douglas, whose ancient castle is situated near the banks of this river. At the distance of ten miles from Lanerk stand the castle and burgh of Crawford-town, remarkable for nothing but giving the title of *earl* to the noble family of Lindsay: a title which, by the death of the late earl, has now devolved to the viscount of Garnock, sprung from the same house, though his surname is changed from Lindsay to Crawford in consequence of a marriage. But the chief place of Lanerkshire, and indeed the great emporium of the west of Scotland, is the large, elegant, and flourishing city of GLASGOW; for a description of which, see that article.

LANFRANC, an Italian, born at Pavia, became archbishop of Canterbury in 1070. He disputed against Berengarius, in the council held at Rome in 1059, and wrote against him concerning the real presence in the eucharist. He had other disputes, &c. and died in 1089.

LANFRANC (John), an eminent Italian history-painter, born at Parma in 1581. He was first the disciple of Augustin Caracci; and, after his death, of Hannibal, whose taste in design and colouring he happily attained, that he was intrusted to execute some of his designs in the Farnesian palace at Rome. There he finished in so masterly a manner, that the difference is imperceptible to this day between his work and that of his master. His genius directed him to grand compositions, which he had a peculiar facility in designing and in painting either in fresco or in oil: he did indeed aspire to the grace of Correggio, but could never arrive at his excellence; his greatest power being manifested in composition and foreshortening. He was deficient in correctness and expression; and his colouring, though sometimes admirable, was frequently too dark. By order of pope Urban VIII. he painted in St Peter's church at Rome the representation of that faint walking on the water, which afforded the pope so much satisfaction, that he knighted him. He died in 1647.

LANGBAINE (Gerard), D. D. a learned English writer, was born in 1608. He was educated at Queen's-college, Oxford; and became keeper of the archives of that university, provost of his college, and

doctor of divinity. He was highly esteemed by arch-bishop Usher, Selden, and several other learned men; and died in 1657-8. He published, 1. An edition of Longinus, in Greek and Latin, with notes. 2. A review of the covenant; and other works.

LANGBAINE (Gerard), an eminent writer, the son of the former, was born in 1656. He was put apprentice to Mr Symonds, bookseller in St Paul's church-yard; but was soon after called from thence by his mother, upon the death of his eldest brother, and by her entered a gentleman-commoner of University-college, Oxford, in 1672. Here he run out a good part of his estate; but afterwards corrected his manner of living, and for some years lived in retirement near Oxford. During this time he improved his taste for dramatic poetry; and at first wrote some small pieces without his name, but afterwards published several works which he publicly owned. In 1690 he was elected inferior beadle of arts in the university of Oxford; and, in January following, was chosen superior beadle of law, but died soon after in 1692. He wrote, 1. The hunter, a discourse on horsemanship. 1. A new catalogue of English plays, with their best editions, and divers remarks on the originals of most plays, and on the plagiarisms of several authors. 3. An account on the English dramatic poets.

LANGELAND (Robert), an old English poet of the 14th century, and one of the first disciples of Wickliffe the reformer. He is said to have been born in Shropshire, but we have no account of his family. He wrote *The visions of Pierce Plowman*; a piece which abounds with imagination and humour, though dressed to great disadvantage in very uncouth versification and obsolete language. It is written without rhyme, an ornament which the poet has endeavoured to supply by making every verse begin with the same letter. Dr Hickes observes, that this kind of alliterative versification was adopted by Langeland from the practice of the Saxon poets, and that these visions abound with Saxonisms: he styles him *celeberrimus ille satirographus, morum vindex acerrimus*, &c. Chaucer and Spencer have attempted imitations of his visions, and the learned Selden mentions him with honour.

LANGELAND, an island of Denmark in the Baltic sea, in the streight called *the great belt*, and between Zealand, Saland, and Fyonia. It produces plenty of corn, and the principal town is Ruteping. E. Long. 11. 10. N. Lat. 55. 0.

LANGETZ, a town of France in Touraine, noted for its excellent melons. It is seated on the river Loire, in E. Long. 0. 23. N. Lat. 42. 20.

LANGIONA, a large, rich, and strong town of Asia, capital of the kingdom of Laos, with a large and magnificent palace, where the king resides. E. Long. 96. 45. N. Lat. 22. 38.

LANGREL-SHOT, a sea, that consisting of two bars of iron joined by a chain or shackle, and having half a ball of iron fixed on each end; by means of which apparatus, it does great execution among the enemy's rigging.

LANGRES, an ancient and considerable town of France, in Champagne, with a bishop's see. The cutlery-wares made here are in high esteem. It is seated.

Langbaine  
||  
Langres.

Langton, seated on a mountain near the river Mearne, in E. Long. 4. 24. N. Lat. 47. 52.

Language.

LANGTON (Stephen), was born in England, but educated at Paris, and was greatly esteemed for his learning by the king and nobility of France. He was chancellor of Paris, a cardinal of Rome, and in the reign of king John was made archbishop of Canterbury by Pope Innocent III. in opposition both to the monks of Canterbury and to the king. Langton was one of the most illustrious men of his age for learning; and continued archbishop 22 years, dying in 1228. A catalogue of his books is given by Bale and Tanner.

LANGUAGE, in the most general meaning of the word, signifies any sound uttered by an animal, by which it expresses any of its passions, sensations, or affections; but it is more particularly understood to denote those various modifications of the human voice, by which the several sensations and ideas of one man are communicated to another.

2. Nature has endowed every animal with powers sufficient to communicate to others of the same species some of its sensations and desires. The organs of most animals are so formed, as readily to perceive and understand (as far as is necessary for their particular species of existence) the voice of those of their own kind; by means of which they assemble together, for the defence or preservation of the species. But as they rise higher in the order of intellectual powers, the powers of expression likewise increase; and the voice alone, even when endowed with a great extent of modulation, is incapable of conveying all that variety of emotions and sensations which on many occasions are necessary to be communicated. In all these cases, motion and gesture are called in to supply the defects of the voice. The amorous pigeon does not trust solely to his plaintive cooing, in order to soften the rigour of his reluctant mate, but adds to it the most submissive and expressive gestures; and the faithful dog, finding his voice alone insufficient to express his joy at meeting with his master, is obliged to have recourse to a variety of endearing actions. But man—the most distinguished of all the animal creation,—although endowed with a power of voice and expression of countenance and gesture eminently superior to all the creatures of God, finds, that all these united are not sufficient to express the infinite variety of ideas with which his mind is stored: for although these may powerfully express the passions and stronger feelings of the mind; yet as they are incapable of expressing the several progressive steps of perception by which his *reason* ascends from one degree of knowledge to another, he has been obliged to discover, by means of his reasoning faculty, a method of expressing with certainty, and communicating with the utmost facility, every perception of his mind.—With this view, having observed, that besides the power of uttering simple sounds, and the several variations of these into acute or grave, open or shrill, &c. by which his stronger feelings were naturally expressed, he was likewise endowed with a power of stopping or interrupting these sounds, by certain closings of the lips with one another, and of the tongue with the palate, &c. he has taken advantage of these circumstances, and formed unto himself a language capable of expressing every

perception of the mind; for, by affixing at all times the same idea to any one sound or combination of sounds thus modified and joined together, he is enabled at any time to excite in the mind of any other person an idea similar to that in his own mind, provided the other person has been previously so far instructed as to know the particular modification of sound which has been agreed upon as the *symbol* of that idea.—Thus man is endowed with two different species of language: one consisting of tones and gestures; which, as it is natural to man considered as a distinct species of animals, and necessary for the preservation and well-being of the whole, is universally understood by all mankind: thus laughter and mirth universally express cheerfulness of mind; while tears, in every part of the globe, discover a heart overflowing with tender sensations; and the humble tone of supplication, or the acute accent of pain, are equally understood by the Hurons of America, and by the more refined inhabitants of Europe. The other species of language, as it is entirely artificial, and derives its power from particular compact, (for before any thing can be recognized as the symbol of an idea, several persons must first agree that such an idea shall be always denoted by this symbol), must be different in different parts of the globe; and every distinct form which it may assume, from the different genius of every society who originally formed a particular language for themselves, will be altogether unintelligible to every other body of men, but those belonging to the same society where that language was originally invented, or those who have been at pains to acquire a knowledge of it by means of study.

3. It is unnecessary for us here to draw any parallel between the nature of these two different species of language; it being sufficiently evident, that the artificial language does not debar the use of the tones and gestures of the natural, but tends to ascertain the meaning of these with greater precision, and consequently to give them greater power. Man must therefore reap many advantages from the use of artificial language, which he could not have enjoyed without it. It is equally plain, that the one, being natural and inspired, must remain nearly the same, without making any progress to perfection; whereas the other, being entirely the invention of man, must have been exceedingly rude and imperfect at first, and must have arrived by slow degrees at greater and greater perfection, as the reasoning faculties acquired vigour and acuteness. It must likewise be subject to perpetual changes, from that variety of incidents which affect all sublunary things: and these changes must always correspond with the change of circumstances in the people who make use of that particular language: for when any particular set of ideas become prevalent among any society of men, words must be adopted to express them; and from these the language must assume its character. Hence the reason why the language of all barbarous and uncivilized people is rude and uncultivated; while those nations which have improved their reasoning faculties, and made some progress in the polite arts, have been no less distinguished by the superiority of their language than by their pre-eminence in other respects.—The language of a brave and martial people is bold and nervous, altho'

perhaps rude and uncultivated; while the language of those nations in which luxury and effeminacy prevail, is flowing and harmonious, but devoid of force and energy of expression.

4. But although it may be considered as a general rule, that the language of any nation is a very exact index of the state of their minds; yet it admits of some particular exceptions. For as man is naturally an imitative animal, and in matters of this kind never has recourse to invention but through necessity; if by some accident any part of a nation should be separated from that community to which they belonged, after a language had been invented, they would retain the same general sounds and *idiom* of language with those from whom they were separated; although in process of time these two people, by living in countries of a dissimilar nature, or being engaged in different occupations, and leading a different manner of life, might lose all knowledge of one another, assume a different national character and opposite dispositions of mind, and form each of them a distinct language to themselves, totally different in genius and style, though agreeing with one another in the fundamental sounds and general *idiom*: so that if this particular *idiom*, formed before their separation, should happen to be more peculiarly adapted to the genius of one of these people than the other, that particular people whose natural genius and style of language was not in concord with the *idiom* which they had adopted, would labour under an inconvenience on this account which they never would be able entirely to overcome; and this inconvenience would prevent their language from attaining such a degree of perfection, as the genius of the people would otherwise naturally have led them to. Thus languages have been originally formed; and thus that happy concord of circumstances which have concurred to raise some languages to that height of perfection which they have attained may be easily accounted for, while many ineffectual efforts have been made to raise other languages to the same degree of excellence.

5. We shall not here enter upon any fruitless inquiries, with a view to discover if only one language was originally formed, or if any language that we are acquainted with has a greater claim to that much envied pre-eminence than others. We have seen, that the discovery of language is entirely within our reach, and evidently the invention of man; and therefore that the invention of different languages by different societies, is extremely probable. But it behoved these different societies, in process of time, to intermix by war or commerce, and their different languages would likewise become mixed. Hence during the succession of many ages, while the principles of language were not understood, many different languages must have been formed, while others may have sunk into oblivion, especially in those early ages before the invention of letters, which alone could preserve their memory. In vain, therefore, would we endeavour to discover the state of those nations or languages of which we have but obscure traces in history. Indeed we have no reason to lament our loss in this particular; for, supposing such a discovery could be made, we could derive little advantage from it, as the antiquity of a language does not necessarily imply any degree of excellence, seeing we all know that some nations have made more progress in impro-

ving their mental faculties, and refining their language, in a few years, than others have done in many ages. We shall therefore leave this subject, and proceed to make some remarks on the advantages or defects of some of those *idioms* of language with which we are most intimately acquainted, as this may perhaps lead us to some discoveries of real utility to ourselves.

6. As the words *IDION* and *GENIUS* of a language are often confounded, it will be necessary to inform the reader, that by *IDION* we would here be understood to mean *that general mode of arranging words into sentences which prevails in any particular language*; and by the *GENIUS* of a language we mean to express *the particular set of ideas which the words of any language, either from their formation or multiplicity, are most naturally apt to excite in the mind of any one who hears it properly uttered*. Thus although the *English*, *French*, *Italian*, and *Spanish* languages, nearly agree in the same general *IDION*; yet the particular *GENIUS* of each is remarkably different: The *English* is naturally bold, nervous, and strongly articulated; the *French* is weaker, and more flowing; the *Italian* more soothing and harmonious; and the *Spanish* more grave, sonorous, and stately. Now, when we examine the several languages which have been most esteemed in Europe, we find that there are only two distinct *IDIONS* among them which are essentially distinguished from one another; and all those languages are divided between these two *idioms*, following sometimes the one, and sometimes the other, either wholly or in part. The languages which may be said to adhere to the first *IDION*, are those which in their construction follow the order of nature; that is, express their ideas in the natural order in which they occur to the mind; the subject which occasions the action appearing first; then the action, accompanied with its several modifications; and, last of all, the object to which it has reference.—These may properly be called *ANALOGOUS* languages; and of this kind are the *English*, *French*, and most of the modern languages in Europe.—The languages which may be referred to the other *IDION*, are those which follow no other order in their construction than what the taste or fancy of the composer may suggest; sometimes making the object, sometimes the action, and sometimes the modification of the action, to precede or follow the other parts. The confusion which this might occasion is avoided by the particular manner of *inflecting* their words, by which they are made to refer to the others with which they ought to be connected, in whatever part of the sentence they occur, the mind being left at liberty to connect the several parts with one another after the whole sentence is concluded. And as the words may be here transposed at pleasure, those languages may be called *TRANSPOSITIVE* languages. To this class we must, in an especial manner, refer the *Latin* and *Greek* languages.—As each of these *idioms* has several advantages and defects peculiar to itself, we shall endeavour to point out the most considerable of them, in order to ascertain with greater precision the particular character and excellence of some of those languages now principally spoken or studied in Europe.

7. The partiality which our forefathers, at the revival of letters in Europe, naturally entertained for the Greek and Roman languages, made them look upon every distinguishing peculiarity belonging to them, as

Language. one of the many causes of the amazing superiority which those language evidently enjoyed above every other at that time spoken in Europe.—This blind deference still continues to be paid to them, as our minds are early prepossessed with these ideas, and as we are taught in our earliest infancy to believe, that to entertain the least idea of our own language being equal to the Greek or Latin in any particular whatever, would be a certain mark of ignorance or want of taste.—Their rights, therefore, like those of the church in former ages, remain still to be examined; and we, without exerting our reason to discover truth from falsehood, tamely sit down satisfied with the idea of their undoubted pre-eminence in every respect.—But if we look around us for a moment, and observe the many excellent productions which are to be met with in almost every language of Europe, we must be satisfied, that *even these* are now possessed of *some* powers which might afford at least a presumption, that, if they were cultivated with a proper degree of attention, they might, in *some respects*, be made to rival, if not to excel, those beautiful and justly admired remains of antiquity.—Without endeavouring to derogate from their merit, let us, with the cool eye of philosophic reasoning, endeavour to bring before the sacred tribunal of Truth some of those opinions which have been most generally received upon this subject, and rest the determination of the cause on her impartial decision.

8. The learned reader well knows, that the several changes which take place in the arrangement of the words in every TRANSPOSITIVE language could not be admitted without occasioning great confusion, unless certain classes of words were endowed with particular variations, by means of which they might be made to refer to the other words with which they ought naturally to be connected.—From this cause proceeds the necessity of several variations of *verbs, nouns, and adjectives*; which are not in the least essential or necessary in the ANALOGOUS languages, as we have pretty fully explained under the article GRAMMAR, to which we refer for satisfaction on this head. We shall in this place consider, whether these variations are an advantage or a disadvantage to language.

9. As it is generally supposed, that every language whose verbs admit of *inflection*, is on that account much more perfect than one where they are varied by *auxiliaries*; we shall, in the first place, examine this with some degree of attention; and that what is said on this head may be the more intelligible, we shall give examples from the Latin and English languages. We make choice of these languages, because the Latin is more purely *transpositive* than the Greek, and the English admits of less *inflection* than any other language that we are acquainted with.

10. If any preference be due to a language from the one or the other method of *conjugating* verbs, it must in a great measure be owing to one or more of these three causes:—Either it must admit of a greater variety of sounds, and consequently more room for harmonious diversity of tones in the language:—or a greater freedom of expression is allowed in uttering any simple idea, by the one admitting of a greater variety in the arrangement of the words which are necessary to express that idea than the other does:—or, lastly, a greater precision and accuracy in fixing the meaning of the person who uses the language, arise from the use

of one of these forms above the other:—for, as every other circumstance which may serve to give a diversity to language, such as the general and most prevalent sounds, the frequent repetition of any one particular letter, and a variety of other circumstances of that nature, which may serve to debase a particular language, are not influenced in the least by the different methods of varying the verbs, they cannot be here considered. We shall therefore proceed to make a comparison of the advantages or disadvantages which may accrue to language by inflecting their verbs, with regard to each of these particulars.

11. The first particular that we have to examine is, Whether the one method of expressing the variations of a verb admits of a greater variety of sounds.—In this respect the Latin seems, at first view, to have a great advantage over the English: for the words *amo, amabam, amaveram, amavero, ameni*, &c. seem to be more different from one another than the English translations of these, *I love, I did love, I had loved, I shall have loved, I may love*, &c.; for, although the syllable *am* is repeated in every one of the first, yet as the last syllable usually strikes the ear with greater force, and leaves a greater impression than the first, it is very probable that many will think the frequent repetition of the word *love* will, in the last instance, appear more striking to the ear than the other. We will therefore allow this its full weight, and grant that there is as great, or even a greater difference between the sounds of the different *tenses* of a Latin verb, than there is between the words that are equivalent to them in English. But as we here consider the variety of sounds of the language in general, before any just conclusion can be drawn, we must not only compare the different parts of the same verb, but also compare the different verbs with one another in each of these languages. And here, at first view, we perceive a most striking distinction in favours of the *analogous* language over the *inflected*: for as it would be impossible to form a particular set of inflections different from one another for each particular verb, all those languages which have adopted this method have been obliged to reduce their verbs into a small number of classes; all the words of each of which classes, commonly called *conjugations*, have the several variations of the *modes, tenses, and persons*, expressed exactly in the same manner, which must of necessity introduce a similarity of sounds into the language in general, much greater than where every particular verb always retains its own distinguishing sound.—To be convinced of this, we need only repeat any number of verbs in Latin and English, and observe on which side the preference with respect to variety of sounds must fall.

Pono,	<i>I put.</i>	Moveo,	<i>I move.</i>
Dono,	<i>I give.</i>	Dolo,	<i>I ail.</i>
Cano,	<i>I sing.</i>	Lugco,	<i>I mourn.</i>
Sono,	<i>I sound.</i>	Obeo,	<i>I die.</i>
Orno,	<i>I adorn.</i>	Gaudeo,	<i>I rejoice.</i>
Pugno,	<i>I fight.</i>	Incipio,	<i>I begin.</i>
Lego,	<i>I read.</i>	Faceo,	<i>I make.</i>
Scribo,	<i>I write.</i>	Fodio,	<i>I dig.</i>
Puto,	<i>I think.</i>	Rideo,	<i>I laugh.</i>
Vivo,	<i>I live.</i>	Impleo,	<i>I fill.</i>
Ambulo,	<i>I walk.</i>	Abstinco,	<i>I forbear.</i>

12. The similarity of sounds is here so obvious in the

Language. the Latin as to be perceived at the first glance: nor can we be surprised to find it so, when we consider, that all their regular verbs, amounting to 4000 or upwards, must be reduced to four conjugations, and even these differing but little from one another, which must of necessity produce the sameness of sounds which we here perceive; whereas, every language that follows the natural order, like the English, instead of this small number of uniform terminations, have almost as many distinct sounds as original verbs in their language.

13. But if, instead of the present of the indicative mood, we should take almost any other tense of the Latin verb, the similarity of sounds would be still more perceptible, as many of these tenses have the same termination in all the four conjugations, particularly in the imperfect of the indicative, as below.

Pone-bam;	<i>I did put,</i>	<i>I put.</i>
Dona-bam;	<i>I did give,</i>	<i>I gave.</i>
Cane-bam;	<i>I did sing,</i>	<i>I sung.</i>
Sona-bam;	<i>I did sound,</i>	<i>I sounded.</i>
Orna-bam;	<i>I did adorn,</i>	<i>I adorned.</i>
Pugna-bam;	<i>I did fight,</i>	<i>I fought.</i>
Lege-bam;	<i>I did read,</i>	<i>I read.</i>
Scribe-bam;	<i>I did write,</i>	<i>I wrote.</i>
Putā-bam;	<i>I did think,</i>	<i>I thought.</i>
Vive-bam;	<i>I did live,</i>	<i>I lived.</i>
Ambula-bam;	<i>I did walk,</i>	<i>I walked.</i>
Move-bam;	<i>I did move,</i>	<i>I moved.</i>
Dole-bam;	<i>I did ail,</i>	<i>I ailed.</i>
Luge-bam;	<i>I did mourn,</i>	<i>I mourned.</i>
Obi-bam;	<i>I did die,</i>	<i>I died.</i>
Gaude-bam;	<i>I did rejoice,</i>	<i>I rejoiced.</i>
Incipie-bam;	<i>I did begin,</i>	<i>I began.</i>
Facie-bam;	<i>I did make,</i>	<i>I made.</i>
Fodie-bam;	<i>I did dig,</i>	<i>I dug.</i>
Ride-bam;	<i>I did laugh,</i>	<i>I laughed.</i>
Imple-bam;	<i>I did fill,</i>	<i>I filled.</i>
Abstine-bam;	<i>I did forbear,</i>	<i>I forbore.</i>

4. It is unnecessary to make any remarks on the Latin words in this example; but in the English translation we have carefully marked, in the first column, the words without any inflection; and, in the second, have put down the same meaning by an inflection of our verb; which we have been enabled to do, from a peculiar excellency in our own language unknown to any other either ancient or modern. Were it necessary to pursue this subject farther, we might observe, that the *perfect* tense in all the conjugations ends universally in *I*, the *pluperfect* in *ERAM*, and the *future* in *AM* or *BO*; in the subjunctive mood, the *imperfect* universally in *REM*, the *perfect* in *ERIM*, the *pluperfect* in *ISSEM*, and the *future* in *ERO*: and as a still greater sameness is observable in the different variations for the persons in

these tenses, seeing the first person plural in all tenses ends in *MUS*, and the second person in *TIS*, with little variation in the other persons; it is evident, that, in respect of diversity of sounds, this method of conjugating verbs by *inflection*, is greatly inferior to the more natural method of expressing the various connections and relations of the verbal attributive by different words, usually called *auxiliaries*.

15. The second particular by which the different methods of marking the relation of the verbal attributive can affect language, arises from the variety of expressions, which either of these may admit of in uttering the same sentiment.—In this respect, likewise, the method of conjugating by inflection seems to be deficient. Thus the present of the indicative mood in Latin can at most be expressed only in two ways, viz. *scribo*, and *ego scribo*; which ought perhaps in strictness to be admitted only as one: whereas, in English, we can vary it in four different ways, viz. *1st*, *I write*; *2dly*, *I do write*; *3dly*, *Write I do*; *4thly*, *Write do I (A)*. And if we consider the further variation which these receive in power as well as in sound, by having the accent placed on the different words; instead of four, we will find eleven different variations: thus, *1st*, *I write*, with the emphasis upon the *I*;—*2dly*, *I write*, with the emphasis upon the word *write*. Let any one pronounce these with the different accent necessary, and he will be immediately satisfied that they are not only distinct from each other with respect to meaning, but also with regard to sound; and the same must be understood of all the other parts of this example.

- |                       |                        |
|-----------------------|------------------------|
| 3. <i>I do write,</i> | 8. <i>Write I do,</i>  |
| 4. <i>I do write,</i> | 9. <i>Write do I,</i>  |
| 5. <i>I do write,</i> | 10. <i>Write do I.</i> |
| 6. <i>Write I do,</i> | 11. <i>Write do I.</i> |
| 7. <i>Write I do.</i> |                        |

None of the Latin tenses admit of more variations than the two above mentioned: nor do almost any of the English admit of fewer than in the above example; and several of these phrases, which must be considered as exact translations of some of the tenses of the Latin verb, admit of many more. Thus the imperfect of the subjunctive mood, which in Latin admits of the above two variations, admits in English of the following:

- |                               |                               |
|-------------------------------|-------------------------------|
| 1. <i>I might have wrote.</i> | 4. <i>Wrote might have I.</i> |
| 2. <i>Wrote I might have.</i> | 5. <i>I wrote might have.</i> |
| 3. <i>Have wrote I might.</i> | 6. <i>Have wrote might I.</i> |

And if we likewise consider the variations which may be produced by a variation of the emphasis, they will be as under.

1. *I*

(A) We are sufficiently aware, that the last variation cannot in strictness be considered as good language; although many examples of this manner of using it in serious compositions, both in poetry and prose, might be easily produced from the best authors in the English Language.—But however unjustifiable it may be to use it in serious composition; yet, when judiciously employed in works of humour, this and other forced expressions of the like nature produce a fine effect, by giving a burlesque air to the language, and beautifully contrasting it to the purer diction of solid reasoning. The sagacious Shakespeare has, on many occasions, shewed how successfully these may be employed in composition, particularly in drawing the character of ancient *Pistol*, in Henry V. Without this liberty, Butler would have found greater difficulty in drawing the inimitable character of Hudibras.—Let this apology suffice for our having inserted this and other variations of the same kind; which, although they may be often improper for serious composition, have still their use in language.

1. *I might have wrote.*
2. *I MIGHT have wrote.*
3. *I might HAVE wrote.*
4. *I might have WRITE.*
5. *WRITE I might have.*
6. *Wrote I might have.*
7. *Wrote I MIGHT have.*
8. *Wrote I might HAVE.*
9. *HAVE wrote I might.*
10. *HAVE WRITE I might.*
11. *Have wrote I might.*
12. *Have wrote I MIGHT.*
13. *Wrote might have I.*
14. *Wrote MIGHT have I.*
15. *Wrote might HAVE I.*
16. *Wrote might have WRITE.*
17. *I wrote might have.*
18. *I wrote might HAVE.*
19. *I wrote MIGHT have.*
20. *I wrote might HAVE.*
21. *Have wrote might I.*
22. *Have WRITE might I.*
23. *Have wrote MIGHT I.*
24. *Have wrote might I.*

In all 24 variations, instead of two.—If we likewise consider, that the Latins were obliged to employ the same word, not only to express “*I might have wrote*,” but also, “*I could, I would, or I should have wrote*,” each of which would admit of the same variations as the word *might*; we have in all ninety-six different expressions in English for the same phrase which in Latin admits only of two, unless they have recourse to other forced turns of expression, which the defects of their verbs in this particular has compelled them to invent.

16. But, if it should be objected, that the last circumstance we have taken notice of as a defect, can only be considered as a defect of the Latin language, and is not to be attributed to the *inflection* of their verbs, seeing they might have had a particular tense for each of these different words *might, could, would, and should*; we answer, that, even admitting this excuse as valid, the superiority of the analogous language, as such, still remains in this respect as 12 to 1.—Yet even this concession is greater than ought to have been made: For as the difficulty of forming a sufficient variety of words for all the different modifications which a verb may be made to undergo is too great for any rude people to overcome; we find, that every nation which has adopted this mode of inflection, not excepting the Greeks themselves, has been obliged to remain satisfied with fewer words than would have been necessary even to effect this purpose, and make the same word serve a double, treble, or even quadruple office, as in the Latin tense which gave rise to these observations: So that, however in physical necessity this may not be chargeable upon this particular mode of construction, yet in moral certainty it must always be the case; and therefore we may safely conclude, that the mode of varying verbs by *inflection* affords less variety in the arrangement of the words of the particular phrases, than the method of varying them by the help of auxiliaries.

17. But if there should still remain any shadow of doubt in the mind of the reader, whether the method of varying the verbs by *inflection*, is inferior to that by *auxiliaries*, with regard to diversity of sounds, or variety of expression; there cannot be the least doubt, but that, with respect to precision, distinctness, and accuracy, in expressing any idea, the latter enjoys a superiority beyond all comparison.—Thus the Latin verb *Amo*, may be Englished either by the words, *I love, or I do love*, and the emphasis placed upon any of the words that the circumstances may require; by means of which, the meaning is pointed out with a force and energy which it is altogether impossible to produce by the use of any single word. The fol-

lowing line from Shakspeare's *Othello* may serve as an example: Language.

—Excellent wretch!

Perdition catch my soul, but *I do love thee*:

In which the strong emphasis upon the word *do*, gives it a force and energy which conveys, in an irresistible manner, a most perfect knowledge of the situation of the mind of the speaker at the time.—That the whole energy of the expression depends upon this seemingly insignificant word, we may be at once satisfied of, by keeping it away in this manner:

—Excellent wretch!

Perdition catch my soul, but *I love thee*.

How poor—how tame—how insignificant is this, when compared with the other! Here nothing remains but a tame assertion, ushered in with a pompous exclamation which could not here be introduced with any degree of propriety. Whereas, in the way that Shakspeare has left it to us, it has an energy which nothing can surpass; for, overpowered with the irresistible force of Desdemona's charms, this strong exclamation is extorted from the soul of Othello in spite of himself. Surprised at this tender emotion, which brings to his mind all those amiable qualities for which he had so much esteemed her, and at the same time fully impressed with the firm persuasion of her guilt, he bursts out into that seemingly inconsistent exclamation, *Excellent wretch!* and then he adds in the warmth of his surprise,—thinking it a thing most astonishing that any warmth of affection should still remain in his breast, he even confirms it with an oath,—*Perdition catch my soul, but I do love thee.*—“In spite of all the falsehoods with which I know thou hast deceived me—in spite of all the crimes of which I know thee guilty—in spite of all those reasons for which I ought to hate thee—in spite of myself,—still I find that I love,—yes, I do love thee.” We look upon it as a thing altogether impossible to transfuse the energy of this expression into any language whose verbs are regularly inflected.

18. In the same manner we might go through all the other tenses, and shew that the same superiority is to be found in each.—Thus, in the *perfect tense* of the Latins, instead of the simple *AMAVI*, we say, *I HAVE LOVED*; and by the liberty we have of putting the emphasis upon any of the words which compose this phrase, we can in the most accurate manner fix the precise idea which we mean to excite: for if we say, *I have loved*, with the emphasis upon the word *I*, at once points out the person as the principal object in that phrase, and makes us naturally look for a contrast in some other person, and the other parts of the phrase become subordinate to it;—“*he has loved thee much, but I have loved thee infinitely more.*” The Latins too, as they were not prohibited from joining the pronoun with their verb, were also acquainted with this excellence, which Virgil has beautifully used in this verse:

—Nos patriam fugimus;

Tu, Tytere, lentus in umbra, &c.

But we are not only enabled thus to distinguish the person in as powerful a manner as the Latins, but can also with the same facility point out any of the other circumstances as principals; for if we say, with the emphasis—

Language. emphasis upon the word *have*, "I HAVE loved," it as naturally points out the time as the principal object, and makes us look for a contrast in that peculiarity, I HAVE: "I have loved indeed;—my imagination has been led astray—my reason has been perverted:—but, now that time has opened my eyes, I can smile at those imaginary distresses which once perplexed me."—In the same manner we can put the emphasis upon the other word of the phrase *loved*,—"I have LOVED."—Here the passion is exhibited as the principal circumstance; and as this can never be excited without some object, we naturally wish to know the object of that passion—"Who! what have you loved?" are the natural questions we would put in this case. "I have LOVED—Eliza."—In this manner we are, on all occasions, enabled to express, with the utmost precision, that particular idea which we would wish to excite, so as to give an energy and perspicuity to the language, which can never be attained by those languages whose verbs are conjugated by inflection: and if to this we add the inconvenience which all inflected languages are subject to, by having too small a number of tenses, so as to be compelled to make one word, on many occasions, supply the place of two, three, or even four, the balance is turned still more in our favours.—Thus, in Latin, the same word *AMABO* stands for *shall* or *will* love, so that the reader is left to guess from the context which of the two meanings it was most likely the writer had in view.—In the same manner, *may* or *can* love are expressed by the same word *AMEN*; as are also *wight*, *could*, *would*, or *should* love, by the single word *AMAREM*, as we have already observed; so that the reader is left to guess which of these four meanings the writer intended to express: which occasions a perplexity very different from that clear precision which our language allows of, by not only pointing out the different words, but also by allowing us to put the emphasis upon any of them we please, which superadds energy and force to the precision it would have had without that assistance.

19. Upon the whole, therefore, after the most candid examination, we must conclude, that the method of conjugating verbs by *inflection* is inferior to that which is performed by the help of *auxiliaries*;—because it does not afford such a diversity of sounds, nor allow such variety in the arrangement of expression for the same thought,—nor give so great distinction and precision in the meaning.—It is, however, attended with one considerable advantage above the other method: for as the words of which it is formed are necessarily of greater length, and more sonorous, than in the analogous languages, it admits of a more flowing harmony of expression; for the number of monosyllables in this last greatly checks that pompous dignity which naturally results from longer words. Whether this single advantage is sufficient to counterbalance all the other defects with which it is attended, is left to the judgment of the reader to determine:—but we may remark, before we quit the subject, that even this excellence is attended with some peculiar inconveniences, which shall be more particularly pointed out in the sequel.

20. But perhaps it might still be objected, that although the comparison we have made above may be fair, and the conclusion just, with regard to the Latin and English languages; yet it does not appear clear, that on that account the method of conjugating verbs by *inflection* is inferior to that by *auxiliaries*: for although it be allowed, that the Latin language is defective in point of tenses; yet if a language were formed which had a sufficient number of inflected tenses to answer every purpose; if it had, for instance, a word properly formed for every variation of each tense; one for *I love*, another for *I do love*; one for *I shall*, another for *I will love*; one for *I might*, another for *I could*, and *would*, and *should love*; and so on through all the other tenses; that this language would not be liable to the objections we have brought against the inflection of verbs; and that of course, the objections we have brought are only valid against those languages which have followed that mode and executed it imperfectly.—We answer, that although this would in some measure remedy the evil, yet it would not remove it entirely. For in the first place, unless every verb, or a very small number of verbs, were conjugated in one way, having the sound of the words in each tense, and divisions of tenses, as we may say, different from all the other conjugations,—it would always occasion a sameness of sound, which would in some measure prevent that variety of sounds so proper for a language. And even if this could be effected, it would not give such a latitude to the expression as auxiliaries allow: for although there should be two words, one for *I might*, and another for *I could love*; yet as these are single words, they cannot be varied; whereas, by auxiliaries, either of these can be varied 24 different ways, as has been shewn above.—In the last place, no single word can ever express all that variety of meaning which we can do by the help of our auxiliaries and the emphasis. *I have loved*, if expressed by any one word, could only denote at all times one distinct meaning; so that, to give it the power of ours, three distinct words at least would be necessary. However, if all this were done;—that is, if there were a distinct conjugation formed for every 40 or 50 verbs;—if each of the tenses were properly formed, and all of them different from every other tense as well as every other verb; and these all carried thro' each of the different persons, so as to be all different from one another;—and if likewise there were a distinct word to mark each of the separate meanings which the same tense could be made to assume by means of the emphasis; and if all this infinite variety of words could be formed in a distinct manner, different from each other, and harmonious;—this language would have powers greater than any that could be formed by auxiliaries, if it were possible for the human powers to acquire such a degree of knowledge as to be able to employ it with facility. But how could this be attained, since upwards of ten thousand words would be necessary to form the variations of any one verb, and a hundred times that number would not include the knowledge of the verbs alone of such a language (z)!—How much, therefore, ought we to admire the simple perspicuity of our language, which

(z) This assertion may perhaps appear to many very much exaggerated: but if any should think so, we only beg the favour that he will set himself to mark all the variations of tenses, mode, person, and number, which an English verb

Language. which enables us, by the proper application of ten or twelve seemingly trifling words, the meaning and use of which can be attained with the utmost ease, to express all that could be expressed by this unwieldy apparatus? What can equal the simplicity or the power of the one method, but the well-known powers of the 24 letters, the knowledge of which can be obtained with so much ease—and their powers know no limits?—or what can be compared to the sacred perfection of the other, but the transcript of it which the Chinese seem to have formed in their unintelligible language?

21. Having thus considered pretty fully the advantages and defects of each of these two methods of varying verbs, we cannot help feeling a secret wish arise in our mind, that there had been a people sagacious enough to have united the powers of the one method with those of the other; nor can we help being surprised, that, among the changes which took place in the several languages of Europe after the downfall of the Roman monarchy, some of them did not accidentally stumble on the method of doing it. From many concurring circumstances, it seems probable, that the greatest part, if not all the Gothic nations that overran Italy at that time, had their verbs varied by the help of auxiliaries; and many of the modern European languages which have sprung from them, have so far borrowed from the Latin, as to have some of the tenses of their verbs inflected: yet the English alone have in any instance combined the joint powers of the two: which could only be done by forming inflections for the different tenses in the same manner as the Latins, and at the same time retaining the original method of varying them by auxiliaries; by which means either the one or the other method could have been employed as occasion required. We have luckily two tenses formed in that way; the *present* of the indicative, and the *past*. In almost all our verbs these can be declined either with or without auxiliaries. Thus the present, without an auxiliary, is, *I love, I write, I speak*; with an auxiliary, *I do write, I do love, I do speak*. In the same manner, the past tense, by inflection, is, *I loved, I wrote, I spoke*; by auxiliaries, *I did love, I did speak, I did write*. Every author, who knows any thing of the power of the English language, knows the use which may be made of this distinction. What a pity is it that we should have stopt short so soon! how blind was it in so many other nations to imitate the defects, without making a proper use of that beautiful language which is now numbered among the dead!

22. After the verbs, the next most considerable variation we find between the *analogous* and *transpositive* languages is in the nouns; the latter varying the different cases of these by *inflection*; whereas the former expresses all the different variations of them by the help of other words prefixed, called *prepositions*. Now, if we consider the advantages or disadvantages of either of these methods under the same heads as we have done the verbs, we will find, that with regard to the first particular, *viz.* variety of sounds, almost the same remarks may be made as upon the verbs; for if we compare any particular noun by itself, the variety of sound appears much greater between the different cases in the *Transpositive*, than between the translation of

these in the *Analogous* language. Thus, *REX, REGIS, Language. REGI, REGEM, &c.* are more distinct from one another in point of sound, than the translation of these, *a king, of a king, to a king, a king, &c.* But if we proceed one step further, and consider the variety which is produced in the language *in general*, by the one or the other of these methods, the case is entirely reversed. For as it would have been impossible to form distinct variations, different from one another, for each case of every noun, they have been obliged to reduce all their nouns into a few general classes, called *declensions*, and endowed all those included under each class with the same termination in every case; which produces a like similarity of sound with what we already observed was occasioned to the verbs from the same cause; whereas in the analogous languages, as there is no necessity for any constraint, there is almost as great a variety of sounds as there are of nouns. The Latins have only five different declensions; so that all the great number of words of this general order must be reduced to the very small diversity of sounds which these few classes admit of; and even the sounds of these few classes are not so much diversified as they might have been, as many of the different cases in the different declensions have exactly the same sounds, as we shall have occasion to remark more fully hereafter. We might here produce examples to shew the great similarity of sounds between different nouns in the Latin language, and variety in the English, in the same way as we did of the verbs: but that every reader in the least acquainted with these two languages can satisfy himself in this particular, without any further trouble than by marking down any number of Latin nouns, with their translations into English, we thought it unnecessary to dwell longer on this particular.

23. But if the inflection of nouns is a disadvantage to a language in point of diversity of sounds, it is very much the reverse with regard to the variety it allows in the arranging the words of the phrase. Here, indeed, the Transpositive language shines forth in all its glory, and the Analogous must yield the palm without the smallest dispute. For as the *nominative case* (or that noun which is the cause of that energy expressed by the verb) is different from the *accusative* (or that noun upon which the energy expressed by the verb is exerted), these may be placed in any situation that the writer shall think proper, without occasioning the smallest confusion: whereas in the analogous languages, as these two different states of the noun are expressed by the same word, they cannot be distinguished but by their position alone: so that the noun which is the efficient cause must always precede the verb, and that which is the active subject must follow; which greatly cramps the harmonious flow of composition.—Thus the Latins, without the smallest perplexity in the meaning, could say either *Brutum amavit Cassius*, or *Cassius amavit Brutum*, or *Brutum Cassius amavit*, or *Cassius Brutum amavit*. As the termination of the word *Cassius* always points out that it is in the *nominative case*, and therefore that he is the person from whom the energy proceeds; and in the same manner, as the termination of the word *Brutum* points out that it is in the *accusative case*, and consequently that he is the ob-

verb can be made to assume, varying each of these in every way that it will admit, both as to the diversity of expression and the emphasis; he will soon be convinced that we have here said nothing more than enough.

Language. ject upon whom the energy is exerted; the meaning continues still distinct and clear, notwithstanding of all these several variations: whereas in the English language, we could only say *Cassius loved Brutus*, or, by a more forced phraseology, *Cassius Brutus loved*: Were we to reverse the case, as in the Latin, the meaning also would be reversed; for if we say *Brutus loved Cassius*, it is evident, that, instead of being the person beloved, as before, *Brutus* now becomes the person from whom the energy proceeds, and *Cassius* becomes the object beloved.—In this respect, therefore, the analogous languages are greatly inferior to the transpositive; and indeed it is from this single circumstance alone that they derive their chief excellence.

24. But although it thus appears evident, that any language, which has a particular variation of its nouns to distinguish the *accusative* from the *nominative case*, has an advantage over those languages which have none; yet it does not appear that any other of their *cases* adds to the variety, but rather the reverse: for, in Latin, we can only say *Amor Dei*; in English, the same phrase may be rendered, either,—*the love of God*,—*of God the love*,—or, by a more forced arrangement, *God the love of*. And as these oblique cases, as the Latins called them, except the *accusative*, are clearly distinguished from one another, and from the *nominative*, by the preposition which accompanies them, we are not confined to any particular arrangement with regard to these as with the *accusative*, but may place them in what order we please, as in Milton's elegant invocation at the beginning of *Paradise Lost*:—

Of man's first disobedience, and the fruit  
Of that forbidden tree, whose mortal taste  
Brought death into the world, and all our wo,  
With loss of Eden, till one greater Man  
Restore us, and regain the blissful feat,  
Sing, heavenly Muse.

In this sentence the transposition is almost as great as the Latin language would admit of, and the meaning as distinct as if Milton had begun with the plain language of prose, thus,—“Heavenly muse, sing of man's first disobedience,” &c.

Before we leave this head, we may remark, that the little attention which seems to have been paid to this peculiar advantage derived from the use of an *accusative case* different from the *nominative*, is somewhat surprising.—The Latins, who had more occasion to attend to this with care than any other nation, have in many cases overlooked it, as is evident from the various instances we meet with in their language where this is not distinguished. For all their nouns in *um* of the second declension, in *e* of the third, and in *u* of the fourth, have each their *nominative* and *accusative singular* alike. Nor in the plural is there any distinction between these two cases in those of the second declension ending in *um*, nor in all those of the third, fourth, and fifth, of every termination, the number of which is very considerable. So that their language reaps no advantage in this respect from almost one half of their nouns. Nor have any of the modern languages in Europe, however much they may have borrowed from the ancient languages in other respects, attempted to copy from them in this particular; from which perhaps more advantage would have been gained, than from copying all the o-

ther supposed excellencies of their language.—But to Language return to our subject.

25. It remains that we consider, whether the inflection of nouns gives any advantage over the method of defining them by prepositions, in point of distinctness and precision of meaning. - But in this respect, too, the analogous languages must come off victorious.—Indeed this is the particular in which their greatest excellence consists; nor was it, we believe, ever disputed, but that, in point of accuracy and precision, this method must excel all others, however it may be defective in other respects.—We observed under this head, when speaking of verbs, that it might perhaps be possible to form a language by inflection which should be capable of as great accuracy as in the more simple order of auxiliaries: but this would have been such an infinite labour, that it was not to be expected that ever human powers would have been able to accomplish it. More easy would it have been to have formed the several inflections of the nouns so different from one another, as to have rendered it impossible ever to mistake the meaning. Yet even this has not been attempted. And as we find that those languages which have adopted the method of inflecting their verbs are more imperfect in point of precision than the other, so the same may be said of inflecting the nouns: for, not to mention the energy which the analogous languages acquire by putting the accent upon the noun, or its preposition (when in an oblique case), according as the subject may require, to express which variation of meaning no particular variety of words have been invented in any inflected language, they are not even complete in other respects.—The Latin, in particular, is in many cases defective, the same termination being employed in many instances for different cases of the same noun.—Thus the genitive and dative singular, and nominative and vocative plural, of the first declension, are all exactly alike, and can only be distinguished from one another by the formation of the sentences;—as are also the *nominative*, *vocative*, and *ablative singular*, and the *dative* and *ablative plural*. In the second, the genitive singular, and *nominative* and *vocative plural*, are the same; as are also the *dative* and *ablative singular*, and *dative* and *ablative plural*; except those in *um*, whose *nominative*, *accusative*, and *vocative singular*, and *nominative*, *accusative*, and *vocative plural*, are alike. The other three declensions agree in as many of their cases as these do; which evidently tends to perplex the meaning, unless the hearer is particularly attentive to, and well acquainted with, the particular construction of the other parts of the sentence; all of which is totally removed, and the clearest certainty exhibited at once, by the help of prepositions in the analogous languages.

It will hardly be necessary to enter into such a minute examination of the advantages or disadvantages attending the variation of *adjectives*; as it will appear evident, from what has been already said, that the endowing them with terminations similar to, and corresponding with the nouns, must tend still more to increase the similarity of sounds in any language, than any of those particulars we have already taken notice of; and were it not for the liberty which they have, in transpositive languages, of separating the adjective from the noun, this must have occasioned such a jingle of similar sounds as could not fail to have been most

Language. disgusting to the ear; but as it would have been impossible in many cases, in those languages where the verbs and nouns are inflected, to have pronounced the words which ought to have followed each other, unless their adjectives could have been separated from the nouns; therefore, to remedy this inconvenience, they were forced to devise this unnatural method of inflecting them also; by which means it is easy to recognize to what noun any adjective has a reference, in whatever part of the sentence it may be placed.—In these languages, therefore, this inflection, both as to gender, number, and case, becomes absolutely necessary; and, by the diversity which it admitted in the arranging the words of the several phrases, might counterbalance the jingle of similar sounds which it introduced into the language.—But what shall we say of those European nations, who, although possessed of a language in every respect different from the transpositive idiom, have nevertheless adopted the variations of their adjectives in the fullest sense? for here they have nothing to counterbalance this disagreeable jingle of similar sounds, so destructive of all real harmony.—In the days of monkish ignorance, when this custom was probably introduced, the clashing of words with one another might be esteemed an ornament; but now that mankind have attained a higher sense of harmony and propriety, we in Britain may felicitate ourselves to find, that our language has escaped this mark of barbarity, to which so many others are now subjected.

26. Having thus examined the most striking particulars in which the transpositive and analogous languages differ, and endeavoured to show the general tendency of every one of the particulars separately, it would not be fair to dismiss the subject without considering each of these as a whole, and pointing out their general tendency in that light: for we all know, that it often happens in human inventions, that every part which composes a whole, taken separately, may appear extremely fine; and yet, when all these parts are put together, they may not agree, but produce a jarring and confusion very different from what we might have expected. We therefore imagine a few remarks upon the genius of each of these two distinct idioms of language considered as a whole will not be deemed useless.

Although all languages agree in this respect, that they are the means of conveying the ideas of one man to another; yet as there is an infinite variety of ways in which we might wish to convey these ideas, sometimes by the easy and familiar mode of conversation, and at other times by more solemn addresses to the understanding, by pompous declamation, &c. it may so happen, that the genius of one language may be more properly adapted to the one of these than the other, while another language may excel in the opposite particular. This is exactly the case in the two general idioms of which we now treat.—Every particular in a transpositive language, is peculiarly calculated for that solemn dignity which is necessary for pompous orations. Long sounding words, formed by the inflection of the different parts of speech,—flowing periods, in which the attention is kept awake by the harmony of the sounds, and an expectation of that word which is to unravel the whole,—if composed by a skilful artist, are admirably suited to that solemn dignity and awful grace which constitute the essence of a

public harangue. On the contrary, in private conversation, where the mind wishes to unbend itself with ease, these become so many clogs which encumber and perplex. At these moments we wish to transmute our thoughts with ease and facility—we are tired with every unnecessary syllable—and wish to be freed from the trouble of attention as much as may be. Like our state-robcs, we would wish to lay aside our pompous language, and enjoy ourselves at home with freedom and ease. Here the solemnity and windings of the transpositive language are burdensome; while the facility with which a sentiment can be expressed in the analogous language is the thing that we wish to acquire.—In this humble, though most engaging sphere, the analogous language moves unrivalled;—in this it wishes to indulge, and never tires. But it in vain attempts to rival the transpositive in dignity and pomp: The number of monosyllables interrupt the flow of harmony; and although they may give a greater variety of sounds, yet they do not naturally possess that dignified gravity which suits the other language. This, then, must be considered as the striking particular in the genius of these two different idioms, which marks their characters.

If we consider the effects which these two different characters of language must naturally produce upon the people who employ them, we will soon perceive, that the genius of the analogous language is much more favourable for the most engaging purposes of life, the civilizing the human mind by mutual intercourse of thought, than the transpositive. For as it is chiefly by the use of speech that man is raised above the brute creation;—as it is by this means he improves every faculty of his mind, and, to the observations which he may himself have made, has the additional advantage of the experience of those with whom he may converse, as well as the knowledge which the human race have acquired by the accumulated experience of all preceding ages;—as it is by the enlivening glow of conversation that kindred-souls catch fire from one another, that thought produces thought, and each improves upon the other, till they soar beyond the bounds which human reason, if left alone, could ever have aspired to;—we must surely consider that language as the most beneficial to society, which most effectually removes these bars that obstruct its progress. Now, the genius of the analogous languages is so easy, so simple and plain, as to be within the reach of every one who is born in the kingdom where it is used, to speak it with facility; even the rudest among the vulgar can hardly fall into any considerable grammatical errors: whereas, in the transpositive languages, so many rules are necessary to be attended to, and so much variation is produced in the meaning by the slightest variations in the sound, that it requires a study far above the reach of the illiterate mechanic ever to attain. So that, how perfect soever the language may be when spoken with purity, the bulk of the nation must ever labour under the inconvenience of rudeness and inaccuracy of speech, and all the evils which this naturally produces.—Accordingly, we find, that in Rome, a man, even in the highest rank, received as much honour, and was as much distinguished among his equals, for being able to converse with ease, as a modern author would be for writing in an easy

Language. and elegant style; and Cæsar among his cotemporaries was as much esteemed for his superiority in speaking the language in ordinary conversation with ease and elegance, as for his powers of oratory, his skill in arms, or his excellence in literary composition. It is needless to point out the many inconveniences which this must unavoidably produce in a state. It is sufficient to observe, that it naturally tends to introduce a vast distinction between the different orders of men; to set an impenetrable barrier between those born in a high and those born in a low station; to keep the latter in ignorance and barbarity, while it elevates the former to such a height as must subject the other to be easily led by every popular demagogue.—How far the history of the nations who have followed this *idiom* of language confirms this observation, every one is left to judge for himself.

Having thus considered LANGUAGE in general, and pointed out the genius and tendency of the two most distinguished *idioms* which have prevailed; we shall close these remarks with a few observations upon the particular nature and genius of those languages which are now chiefly spoken or studied in Europe.

27. Of all the nations whose memory history has transmitted to us, none have been so eminently distinguished for their literary accomplishments, as well as acquaintance with the polite arts, as the Greeks; nor are we as yet acquainted with a language possessed of so many advantages, with so few defects, as that which they used, and which continues still to be known by their name.—The necessary connection between the progress of knowledge and the improvement of language has been already explained; so that it will not be surprising to find their progress in the one keep pace with that of the other: but it will be of utility to point out some advantages which that distinguished people possessed, which other nations, perhaps not less distinguished for talents or taste, have not enjoyed, which have contributed to render their language the most universally admired in ancient as well as in modern times.

As it is probable, that many different societies of men, in the early ages of antiquity, may have found themselves in such circumstances as to be obliged to invent a language to themselves; each would naturally adopt those sounds into their language which chance might suggest, or were most agreeable to their perception of harmony, or most consonant to the disposition of mind of the original inventors; in the same manner as we see that each composer of music has a particular species of sounds of which he is fonder than any other, which will predominate through all his compositions, and give them a certain characteristic tone by which they may be distinguished from that of other composers:—So the language of each particular set of people would have originally a certain characteristic tone of harmony, which would distinguish it from all others; and which would necessarily be more or less perfect, according to the greater or less degree of that delicate sense of harmony, distinguished by the name of *taste*, which these original inventors were possessed of. These sounds, then, being once established by custom, would become familiar to the ear of the descendants of these particular tribes: new words would be invented as knowledge increased; but it behoved these

to be modulated so as to be agreeable to the general tenor of their language, from the necessity of making it consonant as well to the organs of hearing as the organs of speech.—Hence it happens, that the characteristic tones of a language are preferred much longer without variation than any other particular relating to it; and if it change at all, the change must be slow and imperceptible. Knowledge after this may increase; taste may be improved: it may be perceived that the language is not copious enough to express the ideas, or not harmonious enough to please the ear of the composer:—he may readily invent words to supply the deficiency in that respect; but the sounds in a great measure remain without the reach of his power, and he must rest satisfied with these, such as they are, without attempting innovations.—Happy therefore, in this respect, must we deem those nations, whose earliest ancestors have been so fortunate as to adopt no unharmonious sounds into their language, whereby they are freed from one bar to the cultivating those refined pleasures which proceed from the use of a delicate taste, which others may perhaps never be able to surmount: and in this respect no nation was ever so eminently distinguished as the Greeks; which no doubt contributed its share to promote that general elegance and harmony of proportion which prevailed in all their arts. The original sounds and fundamental tones of that language are the most harmonious, and the most agreeable to the ear, of any that have hitherto been invented; inasmuch, that from this principle alone, the sound of their language is agreeable to every nation who has heard it, even when the meaning of the words are not understood; whereas almost all other languages, till they are understood, appear, to an ear which has not been accustomed to them, jarring and discordant. This is the fundamental excellence of that justly admired language; nor have the people failed to improve this to the utmost of their power, by many aids of their own invention. The Greek language is of the *transpositive* kind: but a people so lively, so acute, and so loquacious, could ill bear the ceremonious restraint to which that mode of language naturally subjected them; and have therefore, by various methods, freed it in a great measure from the stiffness which that produced. In infecting their nouns and verbs, they sometimes prefix a syllable, and sometimes add one; which, besides the variety that it gives to the sounds of the language, adds greatly to the distinctness, and admits of a more natural arrangement of the words than in the Latin, and of consequence renders it much fitter for the easiness of private conversation: and indeed, the genius of the people so far prevailed over the *idiom* of the language, as to render it, in the age of its greatest perfection, capable of almost as much ease, and requiring almost as little transposition of words, as those languages which have been called analogous. But as those nations who spoke this language were all governed by popular assemblies, and as no authority could be obtained among them but by a skill in rhetoric and the powers of persuasion; it became necessary for every one, who wished to acquire power or consideration in the state, to improve himself in the knowledge of that language, in the use of which alone he could expect honours or reputation. Hence it happened, that while the vivacity of the people

Language. ple rendered it easy, the great men studiously improved every excellence that it could reap from its powers as a *transpositive* language; so that, when brought to its utmost perfection by the amazing genius of the great Demosthenes, it attained a power altogether unknown to any other language.—Thus happily circumstanced, the Greek language arrived at that envied pre-eminence which it still justly retains. From the progress of arts and sciences; from the gaiety and inventive genius of the people; from the number of free states into which Greece was divided, each of which invented words of its own, all of which contributed to the general stock; and from the natural communication which took place between these states, which excited in the strongest degree the talents of the people; it acquired a copiousness unknown to any ancient language, and excelled by few of the moderns.—In point of harmony of numbers, it is altogether unrivalled; and on account of the ease as well as dignity of which it admitted from the causes above assigned, it admits of perfection in a greater number of particular kinds of composition than any other language known.—The irresistible force and overwhelming impetuosity of Demosthenes seems not more natural to the genius of the language, than the more flowery charms of Plato's calm and harmonious cadences, or the unadorned simplicity of Xenophon; nor does the majestic pomp of Homer seem to be more agreeable to the genius of the language in which he wrote, than the more humble strains of Theocritus, or the laughing festivity of Anacreon: Equally adapted to all purposes, when we peruse any of these authors, we would imagine the language was most happily adapted for his particular style alone. The same powers it likewise, in a great measure, possessed for conversation; and the dialogue seems not more natural for the dignity of Sophocles or Euripides, than for the more easy tenderness of Menander, or buoyonancy of Aristophanes.—With all these advantages, however, it must be acknowledged, that it did not possess that unexceptionable clearness of meaning which some analogous languages enjoy, or that characteristic force which the accent has power to give it, were not these defects counterbalanced by other causes which we shall afterwards point out.

28. The Romans, a people of fierce and warlike dispositions, for many ages during the infancy of their republic, more intent on pursuing conquests and military glory than in making improvements in literature or the fine arts, bestowed little attention to their language. Of a disposition less social or more phlegmatic than the Greeks, they gave themselves no trouble about rendering their language fit for conversation; and it remained strong and nervous, but, like their ideas, was limited and confined. More disposed to command respect by the power of their arms than by the force of persuasion, they despised the more effeminate powers of speech: so that, before the Punic wars, their language was perhaps more reserved and uncourtly than any other at that time known.—But after their rival Carthage was destroyed, and they had no longer that powerful curb upon their ambition; when riches flowed in upon them by the multiplicity of their conquests;—luxury began to prevail, the stern austerity of their manners to relax, and selfish ambition to take place of that disinterested love for their country so

eminently conspicuous among all orders of men before Language. that period.—Popularity began then to be courted: ambitious men, finding themselves not possessed of that merit which insured them success with the virtuous senate, amused the mob with artful and seditious harangues; and by making them believe that they were possessed of all power, and had their sacred rights encroached upon by the senate, led them about at their pleasure, and got themselves exalted to honours and riches by these insidious arts. It was then the Romans first began to perceive the use to which a command of language could be put. Ambitious men then studied it with care, to be able to accomplish their ends; while the more virtuous were obliged to acquire a skill in this, that they might be able to repel the attacks of their adversaries.—Thus it happened, that in a short time that people, from having entirely neglected, began to study their language with the greatest assiduity; and as Greece happened to be subjected to the Roman yoke about that time, and a friendly intercourse was established between these two countries, this greatly conspired to nourish in the minds of the Romans a taste for that art of which they had lately become so much enamoured. Greece had, long before this period, been corrupted by luxury; their taste for the fine arts had degenerated into unnecessary refinement; and all their patriotism consisted in popular harangues and unmeaning declamation. Oratory was then studied as a refined art; and all the subtleties of it were taught by rule, with as great care as the gladiators were afterwards trained up in Rome. But while they were thus idly trying who should be the lord of their own people, the nerves of government were relaxed, and they became an easy prey to every invading power. In this situation they became the *subjects*, under the title of the *allies*, of Rome, and introduced among them the same taste for haranguing which prevailed among themselves. Well acquainted as they were with the powers of their own language, they set themselves with unwearied assiduity to polish and improve that of their new masters: but with all their assiduity and pains, they never were able to make it arrive at that perfection which their own language had acquired; and in the Augustan age, when it had arrived at the summit of its glory, Cicero bitterly complains of its want of copiousness in many particulars.

But as it was the desire of all who studied this language with care, to make it capable of that stately dignity and pomp necessary for public harangues, they followed the genius of the language in this particular, and in a great measure neglected those lesser delicacies which form the pleasure of domestic enjoyment; so that, while it acquired more copiousness, more harmony, and precision, it remained stiff and inflexible for conversation: nor could the minute distinction of nice grammatical rules be ever brought down to the apprehension of the vulgar; whence the language spoken among the lower class of people remained rude and unpolished even to the end of the monarchy. The Huns who over-run Italy, incapable of acquiring any knowledge of such a difficult and abstruse language, never adopted it; and the native inhabitants being made acquainted with a language more natural and easily acquired, quickly adopted that idiom of speech introduced

Language. introduced by their conquerors, although they still retained many of those words which the confined nature of the barbarian language made necessary to allow them to express their ideas.—And thus it was that the language of Rome, that proud mistress of the world, from an original defect in its formation, although it had been carried to a perfection in other respects far superior to any northern language at that time, easily gave way to them, and in a few ages the knowledge of it was lost among mankind : while, on the contrary, the more easy nature of the Greek language has still been able to keep some slight footing in the world, although the nations in which it has been spoken have been subjected to the yoke of foreign dominion for upwards of two thousand years, and their country has been twice ravaged by barbarous nations, and more cruelly depressed than ever the Romans were.

From the view which we have already given of the Latin language, it appears evident, that its idiom was more strictly transpositive than that of any other language yet known, and was attended with all the defects to which that idiom is naturally subjected : nor could it boast of such favourable alleviating circumstances as the Greek, the prevailing sounds of the Latin being far less harmonious to the ear : and although the formation of the words are such as to admit of full and distinct sounds, and so modulated as to lay no restraint upon the voice of the speaker ; yet, to a person unacquainted with the language, they do not convey that enchanting harmony so remarkable in the Greek language. The Latin is flatly and solemn ; it does not excite disgust ; but at the same time it does not charm the ear, so as to make it listen with delighted attention. To one acquainted with the language indeed, the nervous boldness of the thoughts, the harmonious rounding of the periods, the full solemn swelling of the sounds, so distinguishable in the most eminent writers in that language which have been preserved to us, all conspire to make it pleasing and agreeable.—In these admired works we meet with all its beauties, without perceiving any of its defects ; and we naturally admire, as perfect, a language which is capable of producing such excellent works.—Yet with all these seeming excellencies, this language is less copious, and more limited in its style of composition, than many modern languages ; far less capable of precision and accuracy than almost any of these ; and infinitely behind them all in point of easiness in conversation. But these points have been so fully proved already, as to require no further illustration.—Of the compositions in that language which have been preserved to us, the *orations* of Cicero are best adapted to the genius of the language, and we there see it in its utmost perfection. In the *philosophical* works of that great author we perceive some of its defects ; and it requires all the powers of that great man to render his *epistles* agreeable, as these have the genius of the language to struggle with.—Next to oratory, history agrees with the genius of this language ; and Cæsar, in his *Commentaries*, has exhibited the language in its purest elegance, without the aid of pomp or foreign ornament.—Among the poets, Virgil has best adapted his words to his language. The flowing harmony and pomp of it is well adapted for the epic strain, and

the correct delicacy of its taste rendered him perfectly equal to the task. But Horace is the only poet whose force of genius was able to overcome the bars which the language threw in his way, and succeed in lyric poetry. Were it not for the brilliancy of the thoughts, and acuteness of the remarks, which so eminently distinguish this author's compositions, his odes would long ere now have sunk into utter oblivion.—But for conscious have all the Roman poets been of the unfitness of their language for easy dialogue, that almost none of them, after Plautus and Terence, have attempted any dramatic compositions in that language.—Nor have we any reason to regret that they neglected this branch of poetry, as it is probable, if they had ever become fond of these, they would have been obliged to have adopted so many unnatural contrivances to render them agreeable, as would have prevented us (who of course would have considered ourselves as bound to follow them) from making that progress in the drama which so particularly distinguishes the productions of modern times.

29. The modern *Italian* language, from an inattention too common in literary subjects, has been usually called a *child* of the *Latin* language, and is commonly believed to be the ancient Latin a little debased by the mixture of the barbarous language of those people who conquered Italy. The truth is, the case is directly the reverse : for this language, in its general idiom and fundamental principles, is evidently of the analogous kind, first introduced by those fierce invaders, altho' it has borrowed many of its words, and some of its modes of phraseology, from the Latin, with which they were so intimately blended that this could scarcely be avoided ; and it has been from remarking this slight connection so obvious at first sight, that superficial observers have been led to draw this general conclusion, so contrary to fact.

When Italy was over-run with the Lombards, and the empire destroyed by these northern invaders, they, as conquerors, continued to speak their own native language. Fierce and illiterate, they would not stoop to the servility of studying a language so clogged with rules, and difficult of attainment, as the Latin would naturally be to a people altogether unacquainted with nice grammatical distinctions : while the Romans of necessity were obliged to study the language of their conquerors, as well to obtain some relief of their grievances by prayers and supplications, as to destroy that odious distinction which subsisted between the conquerors and conquered while they continued as distinct people. As the language of their new masters, although rude and confined, was natural in its order, and easy to be acquired, the Latins would soon attain a competent skill in it : and as they bore such a proportion to the whole number of people, the whole language would partake somewhat of the general sound of the former : for, in spite of all their efforts to the contrary, the organs of speech could not at once be made to acquire a perfect power of uttering any unaccustomed sounds ; and as it behaved the language of the barbarians to be much less copious than the Latin, whenever they found themselves at a loss for a word, they would naturally adopt those which most readily presented themselves from their new subjects. Thus a language in time was formed, somewhat resembling

sembling the Latin, both in the general tenor of the sounds, and in the meaning of many words: and as the barbarians gave themselves little trouble about language, and in some cases perhaps hardly knew the general analogy of their own language, it is not surprising if their new subjects should find themselves sometimes at a loss on that account, or if, in these situations, they followed, on some occasions, the analogy suggested to them by their own: which accounts for the strange degree of mixture of heterogeneous grammatical analogy we meet with in the Italian as well as Spanish and French languages.—The idiom of all the Gothic languages is purely analogous; and in all probability, before their mixture with the Latins and other people in their provinces, the several grammatical parts of speech followed the plain simple idea which that supposes; the verbs and nouns were all probably varied by auxiliaries, and their adjectives retained their simple unalterable state:—but by their mixture with the Latins, this simple form has been in many cases altered; their verbs became in some cases inflected; but their nouns in all these languages still retained their original form; although they have varied their adjectives, and foolishly clogged their nouns with gender, according to the Latin idioms. From this heterogeneous and fortuitous (as we may say, because injudicious) mixture of parts, results a language possessing almost all the defects of each of the languages of which it is composed, with few of the excellencies of either: for it has neither the ease and precision of the *analogous* nor the pomp and boldness of the *transpositive* languages; at the same time that it is clogged with almost as many rules, and liable to as great abuses.

30. These observations are equally applicable to the French and Spanish, as to the Italian language.—With regard to this last in particular, we may observe, that as the natural inhabitants of Italy, before the last invasion of the barbarians, were sunk and enervated by luxury, and that by depression of mind and genius which anarchy always produces, they had become fond of feasting and entertainments, and the enjoyment of sensual pleasures constituted their highest delight; and their language partook of the same debility as their body.—The barbarians too, unaccustomed to the seductions of pleasure, soon fell from their original boldness and intrepidity, and, like Hannibal's troops of old, were enervated by the sensual gratifications in which a nation of conquerors unaccustomed to the restraint of government freely indulged. The softness of the air,—the fertility of the climate,—the unaccustomed flow of riches which they at once acquired,—together with the voluptuous manner of their conquered subjects,—all conspired to enervate their minds, and render them soft and effeminate. No wonder then, if a language new-moulded at this juncture should partake of the genius of the people who formed it; and, instead of participating of the martial boldness and ferocity of either of their ancestors, should be softened and enfeebled by every device which an effeminate people could invent.—The strong consonants which terminated the words, and gave them life and boldness, being thought too harsh for the delicate ears of these sons of sloth, were banished their language; while sonorous vowels, which

could be protracted to any length in music, were substituted in their stead.—Thus the Italian language is formed flowing and harmonious, but destitute of those nerves which constitute the strength and vigour of a language: at the same time, the sounds are neither enough diversified, nor in themselves of such an agreeable tone, as to afford great pleasure without the aid of musical notes;—and the small pleasure which this affords is still lessened by the little variety of measure which the great familiarity of the terminations of the words occasions. Hence it happens, that this language is fitted for excelling in fewer branches of literature than almost any other: and although we have excellent historians, and more than ordinary poets, in Italian, yet they labour under great inconveniences, from the language wanting nerves and stateliness for the former, and sufficient variety of modulation for the latter. It is, more particularly on this account, altogether unfit for an epic poem: and though attempts have been made in this way by two men whose genius, if not fettered by the language, might have been crowned with success; yet these, notwithstanding the fame that with some they may have acquired, must, in point of poetic harmony, be deemed defective by every impartial person. Nor is it possible that a language which hardly admits of poetry without rhyme, can ever be capable of producing a perfect poem of great length; and the stanza to which their poets have ever confined themselves, must always produce the most disagreeable effect in a poem where unrestrained pomp or pathos are necessary qualifications. The only species of poetry in which the Italian language can claim a superior excellence, is the tender tone of elegy: and here it remains unrivalled and alone; the plaintive melody of the sounds, and smooth flow of the language, being perfectly adapted to express that soothing melancholy which this species of poetry requires. On this account the plaintive scenes of the *Pastor Fido* of Guarini have justly gained to that poem an universal applause; although, unless on this account alone, it is perhaps inferior to almost every other poem of the kind which ever appeared.—We must observe with surprise, that the Italians, who have fettered every other species of poetry with the severest shackles of rhyme, have in this species showed an example of the most unrestrained freedom; the happy effects of which ought to have taught all Europe the powerful charm attending it: yet with amazement we perceive, that scarce an attempt to imitate them has been made by any poet in Europe except by Milton in his *Lycidas*; no dramatic poet, even in Britain, having ever adopted the unrestrained harmony of numbers to be met with in this and many other of their best dramatic compositions.

Of all the languages which sprung up from the mixture of the Latins with the northern people on the destruction of the Roman empire, none of them approach so near to the genius of the Latin as the Spanish does. For as the Spaniards have been always remarkable for their military prowess and dignity of mind, their language is naturally adapted to express ideas of that kind. Sonorous and solemn, it admits nearly of as much dignity as the Latin. For conversation, it is the most elegant and courteous language in Europe.

The humane and generous order of chivalry was  
in..

Language. invented, and kept its footing longest, in this nation; and although it run at last into such a ridiculous excess as deservedly made it fall into universal disrepute, yet it left such a strong tincture of romantic heroism upon the minds of all ranks of people, as made them jealous of their glory, and strongly emulous of cultivating that heroic politeness, which they considered as the highest perfection they could attain. Every man dissipated to flatter, or to yield up any point of honour which he possessed; at the same time, he rigorously exacted from others all that was his due. These circumstances have given rise to a great many terms of respect, and courteous condescension, without meanness or flattery, which give their dialogue a respectful politeness and elegance unknown to any other European language. This is the reason why the characters so finely drawn by Cervantes in *Don Quixote* are still unknown to all but those who understand the language in which he wrote. Nothing can be more unlike the gentle meekness and humane heroism of the knight, or the native simplicity, warmth of affection, and respectful loquacity of the squire, than the inconsistent follies of the one, or the impertinent forwardness and disrespectful petulance of the other, as they are exhibited in every English translation. Nor is it, as we imagine, possible to represent so much familiarity, united with such becoming condescension in the one, and unfeigned deference in the other, in any other European language, as is necessary to paint these two admirable characters.

Although this language, from the solemn dignity and majestic elegance of its structure, is perhaps better qualified than any other modern one for the sublime strains of epic poetry; yet as the poets of this nation have all along imitated the Italians by a most servile subjection to rhyme, they never have produced one poem of this sort, which in point of poetry of style deserves to be transmitted to posterity. And in any other species of poetry but this, or the higher tragedy, it is not naturally fitted to excel. But although the drama and other polite branches of literature were early cultivated in this country, and made considerable progress in it, before the thirst of gain debased their souls, or the desire of universal dominion made them forget that liberty which they once so much prized; since they became enervated by an overbearing pride, and their minds enslaved by superstition; all the polite arts have been neglected: so that, while other European nations have been advancing in knowledge, and improving their language, they have remained in a state of torpid inactivity; and their language has not arrived at that perfection which its nature would admit, or the acute genius of the people might have made us naturally expect.

31. It will perhaps, by some, be thought an unpardonable insult, if we do not allow the French the preference of all modern languages in many respects. But so far must we pay a deference to truth, as to be obliged to rank it among the poorest languages in Europe. Every other language has some sounds which can be uttered clearly by the voice: even the Italian, although it wants energy, still possesses distinctness of articulation. But the French is almost incapable of either of these beauties; for in that language the vow-

els are so much curtailed in the pronunciation, and the words run into one another in such a manner, as necessarily to produce an indistinctness which renders it incapable of measure or harmony. From this cause, it is in a great measure incapable of poetic modulation, and rhyme has been obliged to be substituted in its stead; so that this poorest of all contrivances which has ever yet been invented to distinguish poetry from prose, admitted into all the modern languages when ignorance prevailed over Europe, has still kept some footing in the greatest part of these, rather through a deference for established customs, than from any necessity. Yet as the French language admits of so little poetic modulation, rhyme is in some measure necessary to it; and therefore this poor deviation from prose has been adopted by it, and dignified with the name of *Poetry*. But by their blind attachment to this artifice, the French have neglected to improve so much as they might have done the small powers for harmony of which their language is possessed; and by being long accustomed to this false taste, have become fond of it to such a ridiculous excess, as to have all their tragedies, nay even their comedies, in rhyme. While the poet is obliged to enervate his language, and check the flow of composition, for the sake of linking his lines together, the judicious actor finds more difficulty in destroying the appearance of that measure, and preventing the clinking of the rhymes, than in all the rest of his task. — After this, we will not be surprised to find Voltaire attempt an epic poem in this species of poetry; although the more judicious Fenelon in his *Telemaque* had shown to his countrymen the only species of poetry that their language could admit of for any poem which aspired to the dignity of the epic strain. — Madame Deshoulières, in her *Lyslie*, has shewn the utmost extent of harmony to which their language can attain in smaller poems: indeed in the tenderness of an elegy, or the gaiety of a song, it may succeed; but it is so destitute of force and energy, that it can never be able to reach the pindaric, or even perhaps the lyric strain, — as the ineffectual efforts even of the harmonious Rousseau, in his translation of the psalms of David of this stamp, may fully convince us.

With regard to its powers in other species of composition, the sententious rapidity of Voltaire, and the more nervous dignity of Rousseau, afford us no small presumption, that, in a skilful hand, it might acquire so much force, as to transmit to future historical facts in a style not altogether unworthy of the subject. In attempts at pathetic declamation, the superior abilities of the composer may perhaps on some occasions excite a great idea, but this is ever cramped by the genius of the language: and although no nation in Europe can boast of so many orations where this grandeur is attempted; yet perhaps there are few who cannot produce more perfect, although not more laboured, compositions of this kind.

But notwithstanding the French language labours under all these inconveniences; although it can neither equal the dignity or genuine politeness of the Spanish, the nervous boldness of the English, nor the melting softness of the Italian; although it is destitute of poetic harmony, and so much cramped in sound as to be absolutely unfit for almost every species of musical

fical composition (A); yet the sprightly genius of that volatile people has been able to surmount all these difficulties, and render it the language most generally esteemed, and most universally spoken, of any in Europe: for this people, naturally gay and loquacious, and fond to exceed of those superficial accomplishments which engage the attention of the fair sex, have invented such an infinity of words capable of expressing vague and unmeaning compliment, now dignified by the name of *politeness*, that, in this strain, one who uses the French can never be at a loss; and as it is easy to converse *more*, and really say *less*, in this than in any other language, a man of very moderate talents may distinguish himself much more by using this than any other that has ever yet been invented. On this account, it is peculiarly well adapted for that species of conversation which must ever take place in those general and promiscuous companies, where many persons of both sexes are met together for the purposes of relaxation or amusement; and mult of course be naturally admitted into the courts of princes, and assemblies of great personages; who, having fewer equals with whom they can associate, are more under a necessity of conversing with strangers, in whose company the tender stimulus of friendship does not so naturally expand the heart to mutual trust or unrestrained confidence. In these circumstances, as the heart remaineth disengaged, conversation must necessarily flag; and mankind in this situation will gladly adopt that language in which they can converse most easily without being deeply interested. On these accounts the French now is, and probably will continue to be reckoned the most polite language in Europe, and therefore the most generally studied and known: nor should we envy them this distinction, if our countrymen would not weaken and enervate their own manly language, by adopting too many of their unmeaning phrases.

32. The English is perhaps possessed of a greater degree of excellence, blended with a greater number of defects, than any of the languages we have hitherto mentioned. As the people of Great Britain are a bold, daring, and impetuous race of men; subject to strong passions, and, from the absolute freedom and independence which reigns among all ranks of people throughout this happy isle, little solicitous about controlling these passions;—our language takes its strongest characteristic distinction from the genius of the people; and, being bold, daring, and abrupt, is admirably well adapted to express those great emotions which spring up in an intrepid mind at the prospect

Vol. VI.

of interesting events. Particularly happy too in the full and open sound of the vowels, which forms the characteristic *tone* of the language, and in the strong use of the aspirate H in almost all those words which are used as exclamations, or marks of strong emotions upon interesting occasions, that particular class of words called *interjections* have, in our language, more of that fulness and unrestrained freedom of tones, in which their chief power consists, and are pushed forth from the inmost recesses of the soul in a more forcible and unrestrained manner, than any other language whatever. Hence it is more peculiarly adapted for the great and interesting scenes of the *drama* than any language that has yet appeared in the globe. Nor has any other nation ever arrived at that perfection which the English may justly claim in that respect; for however faulty our dramatic compositions may be in some of the critical niceties which relate to this art,—in nervous force of diction, and in the natural expression of those great emotions which constitute its soul and energy, we claim, without dispute, an unrivalled superiority. Our language too, from the great intercourse that we have had with almost all the nations of the globe by means of our extensive commerce, and from the eminent degree of perfection which we have attained in all the arts and sciences, has acquired a copiousness beyond what any other modern nation can lay claim to; and even the most partial favourers of the Greek language are forced to acknowledge, that in this respect it must give place to the English. Nor is it less happy in that facility of construction which renders it more peculiarly adapted to the genius of a free people, than any other form of language. Of an *idiom* purely analogous, it has deviated less from the genius of that *idiom*, and possesses more of the characteristic advantages attending it, than any other language that now exists: for, while *others*, perhaps by their more intimate connection with the Romans, have adopted some of their transpositions, and clogged their language with unnecessary fetters, *we* have preserved ourselves free from the contagion, and still retain the primitive simplicity of our language. Our *verbs* are all varied by auxiliaries (except in the instance we have already given, which is so much in our favours); our *nouns* remain free from the perplexing embarrassment of *genders*, and our pronouns mark this distinction where necessary with the most perfect accuracy; our *articles* also are of course freed from this unnatural encumbrance, and our *adjectives* preserve their natural freedom and independence. From these causes, our language follows an order of construction

23 G

10

(A) An author of great discernment, and well acquainted with the French language, has lately made the same remark; and as the loftiness of his genius often prevents him from bringing down his illustrations to the level of ordinary comprehension, he has on this, and many other occasions, been unjustly accused of being fond of paradoxes.—But as music never produces its full effect but when the tones it assumes are in unison with the idea that the words naturally excite, it of necessity follows, that if the words of any language do not admit of that fulness of sound, or of that species of tones, which the passion or affection that may be described by the words would naturally require to excite the same idea in the mind of one who was unacquainted with the language, it will be impossible for the music to produce its full effect, as it will be cramped and confined by the sound of the words;—and as the French language does not admit of those full and open sounds which are necessary for pathetic expression in music, it must of course be unfit for musical composition.—It is true indeed, that in modern times, in which so little attention is bestowed on the simple and sublime charms of pathetic expression, and a fantastical tingling of unmeaning sounds is called *music*,—where the sense of the words are lost in figures, quavers, and unnecessary repetition of particular syllables,—all languages are nearly fitted for it; and among these the French: nor is it to be doubted, that, in the easy gaiety of a song, this language can properly enough admit of all the musical expression which that species of composition may require.

Language. so natural and easy, and the rules of *syntax* are so few and obvious, as to be within the reach of the most ordinary capacity. So that from this, and the great clearness and distinctness of meaning with which this mode of construction is necessarily accompanied, it is much better adapted for the familiar intercourse of private society, and liable to fewer errors in using it, than any other language yet known; and on this account we may boast, that in no nation of Europe do the lower class of people speak their language with so much accuracy, or have their minds so much enlightened by knowledge, as in Great Britain.—What then shall we say of the discernment of those grammarians, who are every day echoing back to one another complaints of the poverty of our language on account of the few and simple rules which it requires in *syntax*? As justly might we complain of an invention in mechanics, which, by means of one or two simple movements, obvious to an ordinary capacity, little liable to accidents; and easily put in order by the rudest hand, should possess the whole powers of a complex machine, which had required an infinite apparatus of wheels and contrary movements, the knowledge of which could only be acquired, or the various accidents to which it was exposed by using it be repaired, by the powers of an ingenious artist, as complain of this characteristic excellence of our language as a defect.

But if we thus enjoy in an eminent degree the advantages attending an *analogous* language, we likewise find in a considerable measure the defects to which it is exposed; as the number of monosyllables with which it always must be embarrassed, notwithstanding the great improvements which have been made in our language since the revival of letters in Europe, prevents in some degree that swelling fulness of sound which so powerfully contributes to harmonious dignity and graceful cadences in literary compositions. And as the genius of the people of Britain has always been more disposed to the rougher arts of command than to the softer insinuations of persuasion, no pains have been taken to correct these natural defects of our language; but, on the contrary, by an inattention of which we have hardly a parallel in the history of any civilized nation, we meet with many instances, even within this last century, of the harmony of sound being sacrificed to that brevity so desirable in conversation, as many elegant words have been curtailed, and harmonious syllables suppressed, to substitute in their stead others, shorter indeed, but more barbarous and uncouth. Nay, so little attention have our forefathers bestowed upon the harmony of sounds in our language, that one would be tempted to think, on looking back to its primitive state, that they had on some occasions audaciously debased it. Our language, at its first formation, seems to have laboured under a capital defect in point of sound, as such a number of *S's* enter into the formation of our words, and such a number of letters and combinations of other letters assume a similar sound, as to give a general hiss through the whole tenor of our language, which must be exceedingly disagreeable to every unprejudiced ear. We would therefore have naturally expected, that at the revival of letters, when our forefathers became acquainted with the harmonious languages of Greece and Rome, they would have

acquired a more correct taste, and endeavoured, if possible, to have diminished the prevalence of this disgusting sound. But so far have they been from thinking of this, that they have multiplied this letter exceedingly. The plurals of almost all our nouns were originally formed by adding the harmonious syllable *en* to the singular, which has given place to the letter *s*; and instead of *housen* formerly, we now say *houses*. In like manner, many of the variations of our verbs were formed by the syllable *eth*, which we have likewise changed into the same disagreeable letter; so that, instead of *loveth*, *moveth*, *writeth*, *walketh*, &c. we have changed them into the more modish form of *loves*, *moves*, *writes*, *walks*, &c. Our very auxiliary verbs have suffered the same change; and instead of *hath* and *doth*, we now make use of *has* and *does*. From these causes, notwithstanding the great improvements which have been made in language, within these few centuries, in other respects; yet, with regard to the pleasantness of sound alone, it was perhaps much more perfect in the days of Chaucer than at present: and although custom may have rendered these sounds so familiar to our ear, as not to affect us much; yet to an unprejudiced person, unacquainted with our language, we have not the smallest doubt, but the language of *Bacon* or *Sidney* would appear more harmonious than that of *Robertson* or *Hume*. This is indeed the fundamental defect of our language, and loudly calls for reformation.

But notwithstanding this great and radical defect with regard to pleasantness of sounds, which must be so strongly perceived by every one who is unacquainted with the meaning of our words; yet to those who understand the language, the exceeding copiousness which it allows in the choice of words proper for the occasion, and the nervous force which it derives from the accent, with the perspicuity and graceful elegance the emphasis bestows upon it, makes this defect be totally overlooked; and we could produce such numerous works of prose which excel in almost every different style of composition as would be tire some to enumerate: every reader of taste and discernment will be able to recollect a sufficient number of writings which excel in point of style, between the graceful and becoming gravity so conspicuous in all the works of the author of the *Whole Duty of Man*, and the animated and nervous diction of Robertson in his history of Charles the Fifth,—the more flowery style of Shaftesbury, or the Attic simplicity and elegance of Addison. But although we can equal, if not surpass, every modern language in works of prose, it is in its poetical powers that our language shines forth with the greatest lustre. The brevity to which we must here necessarily confine ourselves, prevents us from entering into a minute examination of the poetical powers of our own, compared with other languages: otherwise it would be easy to shew, that every other modern language labours under great restraints in this respect which ours is freed from;—that our language admits of a greater variety of poetic movements, and diversity of cadence, than any of the admired languages of antiquity;—that it distinguishes with the greatest accuracy between accent and quantity, and is possessed of every other poetic excellence which their languages were capable of: so that we

Language.

Language.

are possessed of all the sources of harmony which they could boast; and, besides all these, have one super-added, which is the cause of greater variety and more forcible expression in numbers than all the rest; that is, the unlimited power given by the emphasis over quantity and cadence; by means whereof, a necessary union between sound and sense, numbers and meaning, in versification, unknown to the ancients, has been brought about, which gives our language in this respect a superiority over all those justly admired languages. But as we cannot here further pursue this subject, we shall only observe, that these great and distinguishing excellencies far more than counter-balance the inconveniences that we have already mentioned: and although, in mere pleasantness of sounds, or harmonious flow of syllables, our language may be inferior to the Greek, the Latin, Italian, and Spanish; yet in point of manly dignity, graceful variety, intuitive distinctness, nervous energy of expression, unconstrained freedom and harmony of poetic numbers, it will yield the palm to none. Our immortal Milton, slowly rising, in graceful majesty stands up as equal, if not superior in these respects to any poet, in any other language, that ever yet existed;—while Thomson, with more humble aim, in melody more smooth and flowing, softens the soul to harmony and peace:—the plaintive moan of Hammond, calls forth the tender tear and sympathetic sigh; while Gray's more soothing melancholy fixes the sober mind to silent contemplation:—more tender still than these, the amiable Shenstone comes; and from his Doric reed, still free from courtly affectation, flows a strain so pure, so simple, and of such tender harmony, as even Arcadian shepherds would be proud to own. But far before the rest, the daring Shakespeare steps forth conspicuous, clothed in native dignity; and, pressing forward with unremitting ardour, boldly lays claim to both dramatic crowns held out to him by Thalia and Melpomene:—his rivals, far behind, look up, and envy him for these unfading glories; and the astonished nations round, with distant awe, behold and tremble at his daring sight. Thus the language, equally obedient to all, bends with ease under their hands, whatever form they would have it assume; and, like the yielding wax, readily receives, and faithfully transmits to posterity, those impressions which they have stamped upon it.

Such are the principal outlines of the language of Great Britain, such are its beauties, and such its most capital defects; a language more peculiarly circumstanced than any that has ever yet appeared. It is the language of a great and powerful nation, whose fleets surround the globe, and who merchants are in every port; a people admired or revered by all the world:—and yet it is less known in every foreign country, than any other language in Europe. In it are written more perfect treatises on every art and science, than are to be found in any other language;—yet it is less sought after or esteemed by the literati in any part of the globe, than almost any of these. Its superior powers for every purpose of language are sufficiently obvious from the models of perfection, in almost every particular, which can be produced in it:—yet it is neglected, despised, and vilified by the people who use it; and many of those authors who owe al-

most the whole of their fame to the excellence of the language in which they wrote, look upon that very language with the highest contempt.—Neglected and despised, it has been trodden under foot as a thing altogether unworthy of cultivation or attention. Yet in spite of all these inconveniences, in spite of the many wounds it has thus received, it still holds up its head, and preserves evident marks of that comeliness and vigour which are its characteristic distinction. Like a healthy oak planted in a rich and fertile soil, it has sprung up with vigour: and although neglected, and suffered to be over-run with weeds; although exposed to every blast, and unprotected from every violence; it still beareth up under all these inconveniences, and shoots up with a robust healthiness and wild luxuriance of growth. Should this plant, so sound and vigorous, be now cleared from those weeds with which it has been so much encumbered;—should every obstacle which now buries it under thick shades, and hides it from the view of every passenger, be cleared away;—should the soil be cultivated with care, and a strong fence be placed around it, to prevent the idle or the wicked from breaking or distorting its branches;—who can tell with what additional vigour it would flourish, or what amazing magnitude and perfection it might at last attain!—How would the astonished world behold, with reverential awe, the majestic gracefulness of that object which they so lately despised!

*Beauty of LANGUAGE considered in regard to Composition.* The beauties of language may be divided into three classes: 1. Those which arise from sound; 2. Those which respect significance; 3. Those derived from a resemblance between sound and signification.

I. *With respect to sound.* In a cursory view, one would imagine, that the agreeableness or disagreeableness of a word with respect to sound, should depend upon the agreeableness or disagreeableness of its component syllables: which is true in part, but not entirely; for we must also take under consideration the effect of syllables in succession. In the first place, syllables in immediate succession, pronounced, each of them, with the same, or nearly the same aperture of the mouth, produce a succession of weak and feeble sounds; witness the French words *dit-il, pathétique*: on the other hand, a syllable of the greatest aperture succeeding one of the smallest, or the contrary, makes a succession, which, because of its remarkable disagreeableness, is distinguished by a proper name, viz. *hiatus*. The most agreeable succession is, where the cavity is increased and diminished alternately, within moderate limits: examples, *Alternative, longevity, pusillanimous*. Secondly, words consisting wholly of syllables pronounced slow, or of syllables pronounced quick, commonly called *long* and *short syllables*, have little melody in them; witness the words *petitioner, fruiterer, dizziness*: on the other hand, the intermixture of long and short syllables is remarkably agreeable; for example, *degree, repent, wonderful, altitude, rapidly, independent, impetuosity*; the cause of which is explained in POETRY, Part II.

To proceed to the music of periods. As the arrangement of words in succession, so as to afford the greatest pleasure to the ear, depends on principles re-

Language. mote from common view, it will be necessary to pre-  
 mise some general observations upon the appearance  
 that objects make when placed in an increasing or de-  
 creasing series; which appearance will vary according  
 to the prevalence of resemblance or of contrast. Where  
 the objects vary by small differences so as to have a  
 mutual resemblance, we in ascending conceive the  
 second object of no greater size than the first, the  
 third of no greater size than the second, and so of the  
 rest; which diminisheth in appearance the size of every  
 object except the first: but when, beginning at the  
 greatest object, we proceed gradually to the least,  
 resemblance makes us imagine the second as great as  
 the first, and the third as great as the second; which  
 in appearance magnifies every object except the first.  
 On the other hand, in a series varying by large dif-  
 ferences, where contrast prevails, the effects are di-  
 rectly opposite: a great object succeeding a small one  
 of the same kind, appears greater than usual; and a  
 little object succeeding one that is great, appears less  
 than usual\*. Hence a remarkable pleasure in view-  
 ing a series ascending by large differences; directly  
 opposite to what we feel when the differences are small.  
 The least object of a series ascending by large dif-  
 ferences has the same effect upon the mind as if it stood  
 single without making a part of the series: but the  
 second object, by means of contrast, appears greater  
 than when view'd singly and apart; and the same ef-  
 fect is perceived in ascending progressively, till we  
 arrive at the last object. The opposite effect is pro-  
 duced in descending; for in this direction, every ob-  
 ject, except the first, appears less than when viewed  
 separately and independent of the series. We may  
 then assume as a maxim, which will hold in the com-  
 position of language as well as of other subjects, That  
 a strong impulse succeeding a weak, makes a double  
 impression on the mind; and that a weak impulse  
 succeeding a strong, makes scarce any impression.

\* See Re-  
 semblance.

† De struct.  
 perfectæ  
 erat. lib. ii.

After establishing this maxim, we can be at no loss  
 about its application to the subject in hand. The  
 following rule is laid down by Diomedes †. "In verbis  
 observandum est, ne a majoribus ad minora descendat  
 oratio; melius enim dicitur, *Vir est optimus*, quam,  
*Vir optimus est*." This rule is also applicable to en-  
 tire members of a period, which, according to our au-  
 thor's expression, ought not, more than single words,  
 to proceed from the greater to the less, but from the  
 less to the greater. In arranging the members of a  
 period, no writer equals Cicero: The following ex-  
 amples are too beautiful to be flurled over by a re-  
 fference.

Quicum quæstor fueram,  
 Quicum me fors consuetudineque majorum,  
 Quicum me decorum hominumque judicium conjunxerat.

Again:

Habet honorem quem petimus,  
 Habet spem quam præpositam nobis habemus,  
 Habet exultationem, multo sudore, labore, vigi-  
 liisque, collectam.

Again:

Eripite nos ex miseris,  
 Eripite nos ex faucibus eorum,

Quorum crudelitas nostro languine non potest expleri. Language.  
 De oratore, l. 1. § 52.

This order of words or members gradually increasing  
 in length, may, so far as concerns the pleasure of sound,  
 be denominated a *climax* in sound.

With respect to the music of periods as united in a  
 discourse, this depends chiefly on variety. Hence a  
 rule for arranging the members of different periods  
 with relation to each other, That to avoid a tedious  
 uniformity of sound and cadence, the arrangement, the  
 cadence, and the length of the members, ought to be  
 diversified as much as possible: and if the members of  
 different periods be sufficiently diversified, the periods  
 themselves will be equally so.

II. With respect to signification. The beauties of  
 language with respect to signification, may not im-  
 properly be distinguished into two kinds: first, the  
 beauties that arise from a right choice of words or ma-  
 terials for constructing the period; and next, the beau-  
 ties that arise from a due arrangement of these words  
 or materials.

1. Communication of thought being the chief end  
 of language, it is a rule, That peripety ought not  
 to be sacrificed to any other beauty whatever. No-  
 thing therefore in language ought more to be studied,  
 than to prevent all obscurity in the expression; for to  
 have no meaning, is but one degree worse than to  
 have a meaning that is not understood. We shall here  
 give a few examples where the obscurity arises from a  
 wrong choice of words.

Livy, speaking of a rout after a battle, "Multique  
 in ruina majore quam fuga oppressi obruncatque."  
 This author is frequently obscure by expressing but  
 part of his thought, leaving it to be completed by his  
 reader. His description of the sea-fight, l. 28. cap. 30.  
 is extremely perplexed.

Unde tibi reditum certo subtemine Parcae  
 Rupere. Hor.

Qui persæpe cava testudine flevit amorem,  
 Non elaboratum ad pedem. Id.

Me fabulose Vulture in Appulo,  
 Altricie extra limea Apulæ,  
 Ludo, fatigatumque somno,  
 Fionde nova puerum palumbes  
 Texere. Id.

Poræ rivus aquæ, silvaque jugerum  
 Paucorum, et segetis certa fides meæ,  
 Fulgentem imperio fertilis Africæ  
 Pallit sorte beator. Id.

Cum fas atque nefas exiguo sine libidinum  
 Discernant avidi. Id.

Ac spem fronte serenat. Virg.

The rule next in order is, That the language ought  
 to correspond to the subject: heroic actions or senti-  
 ments require elevated language; tender sentiments  
 ought to be expressed in words soft and flowing; and  
 plain language void of ornament, is adapted to sub-  
 jects grave and didactic. Language may be consider-  
 ed as the dress of thought; and where the one is not  
 suited to the other, we are sensible of incongruity, in  
 the same manner as where a judge is dressed like a fop,

This concordance between the thought and the words has been observed by every critic, and is so well understood as not to require any illustration. But there is a concordance of a peculiar kind that has scarcely been touched in works of criticism, though it contributes to neatness of composition. It is what follows.

In a thought of any extent, we commonly find some parts intimately united, some slightly, some disjointed, and some directly opposed to each other. To find these conjunctions and disjunctions imitated in the expression, is a beauty; because such imitation makes the words concordant with the sense. This doctrine may be illustrated by a familiar example: When we have occasion to mention the intimate connection that the soul hath with the body, the expression ought to be, *the soul and body*; because the article *the*, relative to both, makes a connection in the expression, resembling in some degree the connection in the thought; but when the soul is distinguished from the body, it is better to say *the soul and the body*; because the disjunction in the words resembles the disjunction in the thought. We proceed to other examples, beginning with conjunctions.

"Constituit agmen; et expedire tela animosque, equitibus iussit," &c. *Livy*, l. 38. § 25. Here the words that express the connected ideas are artificially connected by subjecting them both to the regimen of one verb. And the two following are of same kind.

"Quum ex paucis quotidie aliqui eorum caderent aut vulnerarentur, et qui superarent, fessit et corporibus et animis essent," &c. *Ibid.* § 29.

Post acer Mneſtheus adducto conſtitit arcu,  
Alta petens, pariterque oculos telumque tetendit.  
*Æneid*, v. 507.

But to justify this artificial connection among the words, the ideas they express ought to be intimately connected; for otherwise that concordance which is required between the sense and the expression will be impaired. In that view, the following passage from Tacitus is exceptionable; where words that signify ideas very little connected, are however forced into an artificial union. "Germania omnis a Gallis, Rhætiisque, et Pannoniis, Rheno et Danubio fluminibus; a Sarmatis Dacique, mutuo metu aut montibus separatur."

Upon the same account, the following passage seems equally exceptionable.

—The fiend look'd up, and knew  
His mounted scale aloft; nor more, but fled  
Murm'ring, and with him fled the shades of night.  
*Paradise Lost*, B. iv. at the end.

There is no natural connection between a person's flying or retiring, and the succession of day-light to darkness; and therefore to connect artificially the terms that signify these things cannot have a sweet effect.

Two members of a thought connected by their relation to the same action, will naturally be expressed by two members of the period governed by the same verb; in which case these members, in order to improve their connection, ought to be constructed in the same manner. This beauty is so common among good writers as to have been little attended to; but the neglect of it is remarkably disagreeable: for example, "He did not mention Leonora, nor that her father was dead." Better thus: "He did not mention Leonora, nor her father's death."

Where two ideas are so connected as to require but a copulative, it is pleasant to find a connection in the words that express these ideas, were it even so slight as where both begin with the same letter. Thus,

"The peacock, in all his pride, does not display half the colour that appears in the garments of a British lady, when she is either dressed for a ball or a birthday." *Speff.*

"Had not my dog of a steward run away as he did, without making up his accounts, I had still been immersed in sin and sea-coal." *Ib.*

My life's companion, and my bosom-friend,  
One faith, one fame, one fate shall both attend.  
*Dryden, Translation of Æneid.*

Next as to examples of disjunction and opposition in the parts of the thought, imitated in the expression; an imitation that is distinguished by the name of *antithesis*.

Speaking of Coriolanus soliciting the people to be made consul:

With a proud heart he wore his humble weeds.  
*Coriolanus.*  
"Had you rather Cæsar were living, and die all slaves, than that Cæsar were dead, to live all free men?"

*Julius Cæsar.*  
He hath cool'd my friends and heated mine enemies.  
*Shakespeare.*

An artificial connection among the words, is undoubtedly a beauty when it represents any peculiar connection among the constituent parts of the thought; but where there is no such connection, it is a positive deformity, because it makes a discordance between the thought and expression. For the same reason, we ought also to avoid every artificial opposition of words where there is none in the thought. This last, termed *verbal antithesis*, is studied by low writers, because of a certain degree of liveliness in it. They do not consider how incongruous it is, in a grave composition, to cheat the reader, and to make him expect a contrast in the thought, which upon examination is not found there.

A fault directly opposite to the last mentioned, is to conjoin artificially words that express ideas opposed to each other. This is a fault too gross to be in common practice; and yet writers are guilty of it in some degree, when they conjoin by a copulative things transacted at different periods of time. Hence a want of neatness in the following expression: "The nobility too, whom the king had no means of retaining by suitable offices and preferments, had been seized with the general discontent, and unwarily threw themselves into the scale which began already too much to preponderate." *Hume*. In periods of this kind, it appears more neat to express the past time by the participle passive.

Language. passive, thus: "The nobility having been seized with the general discontent, unwarily threw themselves," &c. Or, "The nobility, who had been seized, &c. unwarily threw themselves," &c.

It is unpleasant to find even a negative and affirmative proposition connected by a copulative:

If it appear not plain, and prove untrue,  
Decadly divorce step between me and you.

Shakespear.

In mirth and drollery it may have a good effect to connect verbally things that are opposite to each other in the thought. Example: Henry IV. of France introducing the Marechal Biron to some of his friends, "Here, gentlemen, (says he), is the Marechal Biron, whom I freely present both to my friends and enemies."

This rule of studying uniformity between the thought and expression, may be extended to the construction of sentences or periods. A sentence or period ought to express one entire thought or mental proposition; and different thoughts ought to be separated in the expression by placing them in different sentences or periods. It is therefore offending against neatness, to crowd into one period entire thoughts requiring more than one; which is joining in language things that are separated in reality. Of errors against this rule take the following examples.

"Behold, thou art fair, my beloved, yea pleasant: also our bed is green."

Burnet, in the history of his own times, giving lord Sunderland's character, says, "His own notions were always good; but he was a man of great expense."

"I have seen a woman's face break out in heats, as she has been talking against a great Lord, whom she had never seen in her life; and indeed never knew a party-woman that kept her beauty for a twelvemonth." Spect.

Lord Bolingbroke, speaking of Strada: "I single him out among the moderns, because he had the foolish presumption to censure Tacitus, and to write history himself; and your Lordship will forgive this short excursion in honour of a favourite writer."

To crowd into a single member of a period different subjects, is still worse than to crowd them into one period:

—Trojan, genitor Adamastor  
Paupere (mansuetique utinam fortuna) profectus.

Æneid iii. 614.

From conjunctions and disjunctions in general, we proceed to comparisons, which make one species of them, beginning with similes. And here also, the intimate connection that words have with their meaning requires, that in describing two resembling objects a resemblance in the two members of the period ought to be studied. To begin with examples of resemblances expressed in words that have no resemblance.

"I have observed of late, the style of some great ministers very much to exceed that of any other productions." Swift. This, instead of studying the resemblance of words in a period that expresses a comparison, is going out of one's road to avoid it. Instead of productions, which resemble not ministers great nor small, the proper word is *writers* or *authors*.

"I cannot but fancy, however, that this imitation, which passes for currently with other judgments, must at some time or other have stuck a little with your Lordship." Shaftesb. Better thus: "I cannot but fancy, however, that this imitation, which passes for currently with others, must at some time or other have stuck a little with your Lordship."

"A glutton or mere sensualist is as ridiculous as the other two characters." Id.

"They wisely prefer the generous efforts of goodwill and affection, to the reluctant compliances of such as obey by force." Bolingb.

It is a still greater deviation from congruity, to affect not only variety in the words, but also in the construction.

Hume speaking of Shakespear: "There may remain a suspicion that we over-rate the greatness of his genius, in the same manner as bodies appear more gigantic on account of their being disproportioned and misshapen." This is studying variety in a period where the beauty lies in uniformity. Better thus: "There may remain a suspicion that we over-rate the greatness of his genius, in the same manner as we over-rate the greatness of bodies that are disproportioned and misshapen."

Next of a comparison where things are opposed to each other. And here it must be obvious, that if resemblance ought to be studied in the words which express two resembling objects, there is equal reason for studying opposition in the words which express contrasted objects. This rule will be best illustrated by examples of deviations from it.

"A friend exaggerates a man's virtues; an enemy inflames his crimes." Spect. Here the opposition in the thought is neglected in the words; which at first view seem to import, that the friend and enemy are employed in different matters, without any relation to each other, whether of resemblance or of opposition. And therefore the contrast or opposition will be better marked by expressing the thought as follows: "A friend exaggerates a man's virtues, an enemy his crimes."

"The wife man is happy when he gains his approbation; the fool when he recommends himself to the applause of those about him." Id. Better: "The wife man is happy when he gains his own approbation, the fool when he gains that of others."

We proceed to a rule of a different kind. During the course of a period, the scene ought to be continued without variation: the changing from person to person, from subject to subject, or from person to subject, within the bounds of a single period, distracts the mind, and affords no time for a solid impression.

Hook, in his Roman history, speaking of Eumenes, who had been beat to the ground with a stone, says, "After a short time he came to himself; and the next day, they put him on board his ship, which conveyed him first to Corinth, and thence to the island of Ægina."

The following period is unpleasant, even by a very slight deviation from the rule: "That sort of instruction which is acquired by inculcating an important moral truth," &c. This expression includes two persons, one acquiring, and one inculcating; and the scene is changed without necessity. To avoid this blemish,

blemish, the thought may be expressed thus: "That sort of instruction which is afforded by inculcating," &c.

The bad effect of such a change of person is remarkable in the following passage: "The Britons, daily harried by cruel inroads from the Picts, were forced to call in the Saxons for their defence, who consequently reduced the greatest part of the island to their own power, drove the Britons into the most remote and mountainous parts, and the rest of the country, in customs, religion, and language, became wholly Saxon." *Swift*.

The following passage has a change from subject to person: "This prostitution of praise is not only a deceit upon the groins of mankind, who take their notion of characters from the learned; but also the better sort must by this means lose some part at least of that desire of fame which is the incentive to generous actions, when they find it promiscuously bestowed on the meritorious and undeserving." *Guardian*, No 4.

The present head, which relates to the choice of materials, shall be closed with a rule concerning the use of copulatives. Longinus observes, that it animates a period to drop the copulatives; and he gives the following example from Xenophon: "Closing their shields together, they were pulh'd, they fought, they flew, they were slain." The reason may be what follows. A continued sound, if not loud, tends to lay us asleep: an interrupted sound rouses and animates by its repeated impulses: this feet composed of syllables, being pronounced with a sensible interval between each, make more lively impressions than can be made by a continued sound. A period of which the members are connected by copulatives, produceth an effect upon the mind approaching to that of a continued sound; and therefore the suppressing copulatives must animate a description. It produces a different effect akin to that mentioned: the members of a period connected by proper copulatives, glide smoothly and gently along; and are a proof of sedateness and leisure in the speaker: on the other hand, one in the hurry of passion, neglecting copulatives and other particles, expresses the principal image only; and for that reason, hurry or quick action is best expressed without copulatives:

Veni, vidi, vici.

— Ite:

Ferte citi flammæ, data vela, impellite remos.

*Æneid*. iv. 593.

Quis globus, O cives, caligine volvitur atra?

Ferte citi ferrum, date tela, scandite muros.

Hostis adest, eja. *Æneid*. ix. 37.

In this view Longinus justly compares copulatives in a period to strait tying, which in a race obstructs the freedom of motion.

It follows, that a plurality of copulatives in the same period ought to be avoided; for if the laying aside copulatives give force and liveliness, a redundancy of them must render the period languid. The following instance may be appealed to, though there are but two copulatives: "Upon looking over the letters of my female correspondents, I find several from women complaining of jealous husbands; and at the same time protesting their own innocence, and desiring my advice upon this occasion." *Speer*.

Where the words are intended to express the coldness of the speaker, there indeed the redundancy of copulatives is a beauty:

"Dining one day at an alderman's in the city, Peter observed him expatiating after the manner of his brethren, in the praises of his sirloin of beef. "Beef," (said the sage magistrate), is the king of meat: beef comprehends in it the quintessence of patridge, and quail, and venison, and pheasant, and plum-pudding, and custard." *Tale of a Tub*, § 4. And the author shows great delicacy of taste by varying the expression in the mouth of Peter, who is represented more animated: "Bread, (says he), dear brothers, is the staff of life, in which bread is contained, *inclusive*, the quintessence of beef, mutton, veal, venison, partridge, plum-pudding, and custard."

Another case must also be excepted. Copulatives have a good effect where the intention is to give an impression of a great multitude consisting of many divisions; for example: "The army was composed of, Grecians, and Carians, and Lycians, and Pamphylians, and Phrygians." The reason is, that a leisurely survey, which is expressed by the copulatives, makes the parts appear more numerous than they would do by a hasty survey: in the latter case, the army appears in one group; in the former, we take as it were an accurate survey of each nation, and of each division.

2. To pave the way for the rules of arrangement, it will be here necessary to explain the difference between a natural style, and that where transposition or inversion prevails. In a natural style, relative words are by juxtaposition connected with those to which they relate, going before or after, according to the peculiar genius of the language. Again, a circumstance connected by a preposition, follows naturally the word with which it is connected. But this arrangement may be varied, when a different order is more beautiful: a circumstance may be placed before the word with which it is connected by a preposition; and may be interjected even between a relative word and that to which it relates. When such liberties are frequently taken, the style becomes inverted or transposed.

But as the liberty of inversion is a capital point in the present subject, it will be necessary to examine it more narrowly, and in particular to trace the several degrees in which an inverted style recedes more and more from that which is natural. And first, as to the placing a circumstance before the word with which it is connected, this is the easiest of all inversion, even so easy as to be consistent with a style that is properly termed *natural*: witness the following examples.

"In the sincerity of my heart, I profess," &c.

"By our own ill management, we are brought to so low an ebb of wealth and credit, that," &c.

"On Thursday morning there was little or nothing transacted in Change-alley."

"At St Bride's church in Fleetstreet, Mr Woolston, (who writ against the miracles of our Saviour), in the utmost terrors of conscience, made a public recantation."

The interjecting a circumstance between a relative word and that to which it relates, is more properly termed *inversion*; because, by a disjunction of words intimately connected, it recedes farther from a natural style. But this licence has degrees; for the disjunction

tion is more violent in some cases than in others.

In nature, though a subject cannot exist without its qualities, nor a quality without a subject; yet in our conception of these, a material difference may be remarked. We cannot conceive a quality but as belonging to some subject: it makes indeed a part of the idea which is formed of the subject. But the opposite holds not; for though we cannot form a conception of a subject void of all qualities, a partial conception may be formed of it, abstracting from any particular quality: we can, for example, form the idea of a fine Arabian horse without regard to his colour, or of a white horse without regard to his size. Such partial conception of a subject, is still more easy with respect to action or motion; which is an occasional attribute only, and has not the same permanency with colour or figure: we cannot form an idea of motion independent of a body; but there is nothing more easy than to form an idea of a body at rest. Hence it appears, that the degree of inversion depends greatly on the order in which the related words are placed: when a substantive occupies the first place, the idea it suggests must subsist in the mind at least for a moment, independent of the relative words afterward introduced; and that moment may without difficulty be prolonged by interjecting a circumstance between the substantive and its connections. This liberty therefore, however frequent, will scarce alone be sufficient to denominate a style *inverted*. The case is very different, where the word that occupies the first place denotes a quality or an action; for as these cannot be conceived without a subject, they cannot without greater violence be separated from the subject that follows; and for that reason, every such separation by means of an interjected circumstance belongs to an inverted style.

To illustrate this doctrine, examples are necessary. In the following, the word first introduced does not imply a relation:

—Nor Eve to iterate  
Her former trespasses fear'd.

—Hunger and thirst at once,  
Powerful persuaders, quicken'd at the scent  
Of that alluring fruit, urg'd me so keen.

Moon that now meet'st the orient sun, now shi'st  
With the fix'd stars, fix'd in their orb that flies,  
And ye five other wand'ring fires that move  
In mystic dance not without song, resound  
His praise.

Where the word first introduced imports a relation, the disjunction will be found more violent:

Of man's first disobedience, and the fruit  
Of that forbidden tree, whose mortal taste  
Brought death into the world, and all our wo,  
With loss of Eden, till one greater man  
Restore us, and regain the blissful seat,  
Sing heav'nly muse.

—Upon the firm opacous globe  
Of this round world, whose first convex divides  
The luminous inferior orbs, inclos'd  
From chaos and th' inroad of darkness old,  
Satan alighted walks.

—On a sudden open fly,  
With impetuous recoil and jarring found,  
Th' infernal doors.

—Wherein remain'd,  
For what could else? to our almighty foe  
Clear victory, to our part loss and rout.

Language would have no great power, were it confined to the natural order of ideas: By inversion a thousand beauties may be compassed, which must be relinquished in a natural arrangement.

*Rules.* 1. In the arrangement of a period, as well as in a right choice of words, the first and great object being perspicuity, the rule above laid down, that perspicuity ought not to be sacrificed to any other beauty, holds equally in both. Ambiguities occasioned by a wrong arrangement are of two sorts; one where the arrangement leads to a wrong sense, and one where the sense is left doubtful. The first, being the more culpable, shall take the lead, beginning with examples of words put in a wrong place.

"How much the imagination of such a preference must exalt a genius, we may observe *merely* from the influence which an ordinary preference has over men," *Shafesb.* This arrangement leads to a wrong sense: the adverb *merely* seems by its position to affect the preceding word; whereas it is intended to affect the following words, an *ordinary preference*; and therefore the arrangement ought to be thus: "How much the imagination of such a preference must exalt a genius, we may observe from the influence which an ordinary preference *merely* has over men." [Or better],—"which even an ordinary preference has over men."

"Sixtus the Fourth was, if I mistake not, a great collector of books at least," *Boling.* The expression here leads evidently to a wrong sense; the adverb *at least*, ought not to be connected with the substantive *books*, but with *collector*, thus: "Sixtus the Fourth was a great collector at least, of books."

Speaking of Lewis XIV. "If he was not the greatest king, he was the best actor of majesty at least, that ever filled a throne." *Id.* Better thus: "If he was not the greatest king, he was at least the best actor of majesty," &c. This arrangement removes the wrong sense occasioned by the juxtaposition of *majesty* and *at least*.

The following examples are of a wrong arrangement of members.

"I have confined myself to those methods for the advancement of piety, which are in the power of a prince limited like ours by a strict execution of the laws." *Swift.* The structure of this period leads to a meaning which is not the author's, viz. power limited by a strict execution of the laws. That wrong sense is removed by the following arrangement: "I have confined myself to those methods for the advancement of piety, which, by a strict execution of the laws, are in the power of a prince limited like ours."

"This morning, when one of lady Lizard's daughters was looking over some hoods and ribbands brought by her tirewoman, with great care and diligence, I employ'd no less in examining the box which contained them." *Guardian.* The wrong sense occasioned by this arrangement, may be easily prevented by varying

it thus : " This morning, when, with great care and diligence, one of Lady Lizard's daughters was looking over some hoods and ribbands," &c.

" A great stone that I happened to find after a long search by the sea-shore, served me for an anchor." *Swift*. One would think that the search was confined to the sea-shore ; but as the meaning is, that the great stone was found by the sea-shore, the period ought to be arranged thus : " A great stone, that, after a long search, I happened to find by the sea-shore, served me for an anchor."

Next of a wrong arrangement where the sense is left doubtful ; beginning, as in the former sort, with examples of a wrong arrangement of words in a member.

" These forms of conversation by degrees multiplied and grew troublesome." *Spekt*. Here it is left doubtful whether the modification by degrees relates to the preceding member or to what follows : it should be, " These forms of conversation multiplied by degrees."

" Nor does this false modesty expose us only to such actions as are indifereet, but very often to such as are highly criminal." *Spekt*. The ambiguity is removed by the following arrangement : " Nor does this false modesty expose us to such actions only as are indifereet." &c.

" The empire of Blefuscu is an island situated to the north-east side of Lilliput, from whence it is parted only by a channel of 800 yards wide." *Swift*. The ambiguity may be removed thus : ——— " from whence it is parted by a channel of 800 yards wide only."

In the following examples the sense is left doubtful by wrong arrangement of members.

" The minister who grows less by his elevation, like a little statue placed on a mighty pedestal, will always have his jealousy strong about him." *Bolingb*. Here, so far as can be gathered from the arrangement, it is doubtful, whether the object introduced by way of simile relates to what goes before or to what follows. The ambiguity is removed by the following arrangement : " The minister, who, like a little statue placed on a mighty pedestal, grows less by his elevation, will always," &c.

Speaking of the superstitious practice of locking up the room where a person of distinction dies : " The knight, seeing his habitation reduced to so small a compass, and himself in a manner shut out of his own house, upon the death of his mother, ordered all the apartments to be flung open, and exorcised by his chaplain." *Spekt*. Better thus : " The knight, seeing his habitation reduced to so small a compass, and himself in a manner shut out of his own house, ordered, upon the death of his mother, all the apartments to be flung open."

Speaking of some indecencies in conversation : " As it is impossible for such an irrational way of conversation to last long among a people that make any profession of religion, or show of modesty, if the country gentlemen get into it, they will certainly be left in the lurch." *Ib*. The ambiguity vanishes in the following arrangement : ——— " the country gentlemen, if they get into it, will certainly be left in the lurch."

" And since it is necessary that there should be a perpetual intercourse of buying and selling, and deal-

ing upon credit, where fraud is permitted or connived at, or hath no law to punish it, the honest dealer is always undone, and the knave gets the advantage." *Swift*. Better thus : " And since it is necessary that there should be a perpetual intercourse of buying and selling, and dealing upon credit, the honest dealer, where fraud is permitted or connived at, or hath no law to punish it, is always undone, and the knave gets the advantage."

From these examples, the following observation will occur : That a circumstance ought never to be placed between two capital members of a period ; for by such situation it must always be doubtful, so far as we gather from the arrangement, to which of the two members it belongs : where it is interjected, as it ought to be, between parts of the member to which it belongs, the ambiguity is removed, and the capital members are kept distinct, which is a great beauty in composition. In general, to preserve members distinct that signify things distinguished in the thought, the best method is, to place first in the consequent member, some word that cannot connect with what precedes it.

If it shall be thought, that the objections here are too scrupulous, and that the defect of perspicuity is easily supplied by accurate punctuation ; the answer is, That punctuation may remove an ambiguity, but will never produce that peculiar beauty which is perceived when the sense comes out clearly and distinctly by means of a happy arrangement. Such influence has this beauty, that, by a natural transition of perception, it is communicated to the very found of the words, so as in appearance to improve the music of the period. But as this curious subject comes in more properly elsewhere, it is sufficient at present to appeal to experience, that a period, so arranged as to bring out the sense clear, seems always more musical than where the sense is left in any degree doubtful.

The next rule is, That words expressing things connected in the thought, ought to be placed as near together as possible. This rule is derived immediately from human nature, prone in every instance to place together things in any manner connected : where things are arranged according to their connections, we have a sense of order ; otherwise we have a sense of disorder, as of things placed by chance : and we naturally place words in the same order in which we would place the things they signify. The bad effect of a violent separation of words or members thus intimately connected, will appear from the following examples.

" For the English are naturally fanciful, and very often disposed, by that gloominess and melancholy of temper which is so frequent in our nation, to many wild notions and visions, to which others are not so liable." *Spekt*. Here the verb or assertion is, by a pretty long circumstance, violently separated from the subject to which it refers : this makes a harsh arrangement ; the less excusable that the fault is easily prevented by placing the circumstance before the verb, after the following manner : " For the English are naturally fanciful, and, by that gloominess and melancholy of temper which is so frequent in our nation, are often disposed to many wild notions, &c."

" From whence we may date likewise the rivalry of

Language. the house of France, for we may reckon that of Valois and that of Bourbon as one upon this occasion, and the house of Austria, that continues at this day, and has oft cost so much blood and so much treasure in the course of it." *Bolingb.*

"It cannot be impertinent or ridiculous therefore in such a country, whatever it might be in the abbot of St Real's, which was Savoy I think; or in Peru, under the Incas, where Garcilasso de la Vega says it was lawful for none but the nobility to study—for men of all degrees to instruct themselves in those affairs wherein they may be actors, or judges of those that act, or controllers of those that judge." *Ibid.*

"If Scipio, who was naturally given to women, for which anecdote we have, if I mistake not, the authority of Polybius, as well as some verses of Nevius preserved by Aulus Gellius, had been educated by Olympias at the court of Philip, it is improbable that he would have restored the beautiful Spaniard." *Ibid.*

If any one have a curiosity for more specimens of this kind, they will be found without number in the works of the same author.

A pronoun, which saves the naming a person or thing a second time, ought to be placed as near as possible to the name of that person or thing. This is a branch of the foregoing rule; and with the reason there given, another concurs, viz. That if other ideas intervene, it is difficult to recal the person or thing by reference.

"If I had leave to print the Latin letters transmittet to me from foreign parts, they would fill a volume, and be a full defence against all that Mr Partridge, or his accomplices of the Portugal inquisition, will be ever able to object; *who*, by the way, are the only enemies my predictions have ever met with at home or abroad." Better thus: ——— "and be a full defence against all that can be objected by Mr Partridge, or his accomplices of the Portugal inquisition; who, by the way, are," &c.

"There being a round million of creatures in human figure, throughout this kingdom, *whose* whole subsistence," &c. *Swift*. Better: "There being, throughout this kingdom, a round million of creatures in human figure, whose whole subsistence," &c.

The following rule depends on the communication of emotions to related objects; a principle in human nature that hath an extensive operation: and we find this operation, even where the objects are not otherwise related than by juxtaposition of the words that express them. Hence, to elevate or depress an object, one method is, to join it in the expression with another that is naturally high or low: witness the following speech of Eumenes to the Roman senate.

"*Causam veniendi sibi Romam fuisse, præter cupiditatem vivendi deos hominesque, quorum beneficio in ea fortuna esset, supra quæm ne optare quidem auderet, etiam ut coram moneret senatum ut Persei conatus obviam iret.*" *Livy*. To join the Romans with the gods in the same enunciation, is an artful stroke of flattery, because it tacitly puts them on a level.

On the other hand, the degrading or vilifying an object, is done successfully by ranking it with one that is really low: "I hope to have this entertainment in readiness for the next winter & doubt not but it will please more than the opera or puppet-

show." *Swift*.

"Manifest have been the judgments which Heaven from time to time, for the chastisement of a sinful people, has inflicted upon whole nations. For when the degeneracy becomes common, it is but just the punishment should be general. Of this kind, in our own unfortunate country, was that destructive pestilence, whose mortality was so fatal as to sweep away, if Sir William Petty may be believed, five millions of Christian souls, besides women and Jews." *Arbutnot*.

"Such also was that dreadful conflagration, ensuing in this famous metropolis of London, which consumed, according to the computation of Sir Samuel Moreland, 100,000 houses, not to mention churches and stables." *Ibid.*

But on condition it might pass into a law, I would gladly exempt both lawyers of all ages, subaltern and field-officers, young heirs, dancing-masters, pick-pockets, and players. *Swift*.

Sooner let earth, air, sea, to chaos fall,  
Men, monkeys, lap-dogs, parrots, perish all.

*Rape of the Lock.*

Circumstances in a period resemble small stones in a building, employed to fill up vacuities among those of a larger size. In the arrangement of a period, such under-parts crowded together make a poor figure; and never are graceful but when interspersed among the capital parts.

"It is likewise urged, that there are, by computation, in this kingdom, above 10,000 parsons, whose revenues, added to those of my lords the bishops, would suffice to maintain, &c." *Swift*. Here two circumstances, viz. *by computation*, and *in this kingdom*, are crowded together unnecessarily. They make a better appearance separated in the following manner: "It is likewise urged, that in this kingdom there are, by computation, above 10,000 parsons, &c."

If there be room for a choice, the sooner a circumstance is introduced, the better; because circumstances are proper for that coolness of mind, with which we begin a period as well as a volume: in the progress, the mind warms, and has a greater relish for matters of importance. When a circumstance is placed at the beginning of the period, or near the beginning, the transition from it to the principal subject is agreeable: it is like ascending, or going upward. On the other hand, to place it late in the period has a bad effect; for after being engaged in the principal subject, one is with reluctance brought down to give attention to a circumstance. Hence evidently the preference of the following arrangement, "Whether in any country a choice altogether unexceptionable has been made, seems doubtful," before this other, "Whether a choice altogether unexceptionable has in any country been made," &c.

For this reason the following period is exceptionable in point of arrangement. "I have considered formerly, with a good deal of attention, the subject upon which you command me to communicate my thoughts to you." *Boling*. Which, with a slight alteration, may be improved thus: "I have formerly, with a good deal of attention, considered the subject," &c.

Swift, speaking of a virtuous and learned education: "And although they may be, and too often are drawn,

Language. drawn, by the temptations of youth, and the opportunities of a large fortune, into some irregularities, when they come forward into the great world; it is ever with reluctance and compunction of mind, because their bias to virtue still continues." Better: "And although, when they come forward into the great world, they may be, and too often," &c.

In arranging a period, it is of importance to determine in what a part of it a word makes the greatest figure, whether at the beginning, during the course, or at the close. The breaking silence rouses the attention, and prepares for a deep impression at the beginning: the beginning, however, must yield to the close; which being succeeded by a pause, affords time for a word to make its deepest impression. Hence the following rule, That to give the utmost force to a period, it ought, if possible, to be closed with that word which makes the greatest figure. The opportunity of a pause should not be thrown away upon accessories, but reserved for the principal object, in order that it may make a full impression: which is an additional reason against closing a period with a circumstance. There are, however, periods, that admit not such a structure; and in that case, the capital word ought, if possible, to be placed in the front, which next to the close is the most advantageous for making an impression. Hence, in directing our discourse to a man of figure, we ought to begin with his name; and one will be sensible of a degradation when this rule is neglected, as it frequently is for the sake of verse. We give the following examples.

Integer vitæ, scelerisque purus,  
Non eget Mauri jaculis, neque arcu,  
Nec venenatis gravida sagittis,  
Fusce, pharetrâ. *Horat. Carm. l. 1. ode 22.*

Je crains Dieu, cher Abner, et n'ai point d'autre crainte.

In these examples, the name of the person addressed to, make a mean figure, being like a circumstance slip into a corner. That this criticism is well founded, we need no other proof than Addison's translation of the last example:

O Abner! I fear my God, and I fear none but him. *Guardian, n° 117.*

O father, what intends thy hand, the cry'd,  
Against thy only son? What fury, O son,  
Possesses thee to bend that mortal dart  
Against thy father's head?

*Paradise lost, book ii. l. 727.*

Every one must be sensible of a dignity in the invocation at the beginning, which is not attained by that in the middle. It is not meant, however, to censure this passage: on the contrary, it appears beautiful, by distinguishing the respect that is due to a father from that which is due to a son.

The substance of what is said in this and the foregoing section, upon the method of arranging words in a period, so as to make the deepest impression with respect to sound as well as signification, is comprehended in the following observation: That order of words in a period will always be the most agreeable, where, without obscuring the sense, the most important ima-

ges, the most sonorous words, and the longest members, bring up the rear.

Hitherto of arranging single words, single members, and single circumstances. But the enumeration of many particulars in the same period is often necessary: and the question is, In what order they should be placed. And, first, with respect to the enumerating particulars of equal rank: As there is no cause for preferring any one before the rest, it is indifferent to the mind in what order they be viewed; therefore it is indifferent in what order they be named. 2dly, If a number of objects of the same kind, differing only in size, are to be ranged along a straight line, the most agreeable order to the eye is that of an increasing series: in surveying a number of such objects, beginning at the least, and proceeding to greater and greater, the mind swells gradually with the successive objects, and in its progress has a very sensible pleasure. Precisely for the same reason, words expressive of such objects ought to be placed in the same order. The beauty of this figure, which may be termed a *climax in sense*, has escaped Lord Bolingbroke in the first member of the following period: "Let but one, great, brave, disinterested, active man arise, and he will be received, followed, and almost adored." The following arrangement has sensibly a better effect: "Let but one brave, great, active, disinterested man arise, &c." Whether the same rule ought to be followed in enumerating men of different ranks, seems doubtful: on the one hand, a number of persons presented to the eye in form of an increasing series, is undoubtedly the most agreeable order; on the other hand, in every list of names, we set the person of the greatest dignity at the top, and descend gradually through his inferiors. Where the purpose is to honour the persons named according to their rank, the latter ought to be followed; but every one who regards himself only, or his reader, will choose the former order. 3dly, As the sense of order directs the eye to descend from the principal to its greatest accessory, and from the whole to its greatest part, and in the same order through all the parts and accessories, till we arrive at the minutest; the same order ought to be followed in the enumeration of such particulars.

When force and liveliness of expression are demanded, the rule is, to suspend the thought as long as possible, and to bring it out full and entire at the close: which cannot be done but by inverting the natural arrangement. By introducing a word or member before its time, curiosity is raised about what is to follow; and it is agreeable to have our curiosity gratified at the close of the period: the pleasure we feel resembles that of seeing a stroke exerted upon a body by the whole collected force of the agent. On the other hand, where a period is so constructed as to admit more than one complete close in the sense, the curiosity of the reader is exhausted at the first close, and what follows appears languid or superfluous: his disappointment contributes also to that appearance, when he finds, contrary to expectation, that the period is not yet finished. Cicero, and after him Quintilian, recommend the verb to the last place. This method evidently tends to suspend the sense till the close of the period; for without the verb the sense cannot be complete: and when the verb happens to be the capital

Language. tal word, which it frequently is, it ought at any rate to be the last, according to another rule above laid down. The following period is placed in its natural order: "Were instruction an essential circumstance in epic poetry, I doubt whether a single instance could be given of this species of composition in any language." The period thus arranged admits a full close upon the word *composition*; after which it goes on languidly, and closes without force. This blemish will be avoided by the following arrangement: "Were instruction an essential circumstance in epic poetry, I doubt whether, in any language, a single instance could be given of this species of composition."

"Some of our most eminent divines have made use of this Platonic notion, as far as it regards the subsilgece of our passions after death, with great beauty and strength of reason." *Spec.* Better thus: "Some of our most eminent divines have, with great beauty and strength of reason, made use of this Platonic notion," &c.

"Men of the best sense have been touched, more or less, with these groundless horrors and presages of fury, upon surveying the most indifferent works of nature." *Id.* Better, "Upon surveying the most indifferent works of nature, men of the best sense," &c.

"She soon informed him of the place he was in, which, notwithstanding all its horrors, appeared to him more sweet than the bower of Mahomet, in the company of his Balsora." *Guardian.* Better, "She soon, &c. which appeared to him, in the company of his Balsora, more sweet than the bower of Mahomet."

None of the rules for the composition of periods are more liable to be abused, than those last mentioned; witness many Latin writers, among the moderns especially, whose style, by inversions too violent, is rendered harsh and obscure. Suspension of the thought till the close of the period, ought never to be preferred before perspicuity. Neither ought such suspension to be attempted in a long period; because in that case the mind is bewildered amidst a profusion of words: a traveller, while he is puzzled about the road, relishes not the finest prospect: "All the rich presents which Altyages had given him at parting, keeping only some Median horses, in order to propagate the breed of them in Persia, he distributed among his friends whom he left at the court of Ecabatana." *Trav. of Cyrus.*

III. *Beauties from a resemblance between Sound and Signification.* There being frequently a strong resemblance of one sound to another, it will not be surprising to find an articulate sound resembling one that is not articulate: thus the sound of a bow-string is imitated by the words that express it:

—The string let fly,  
*Twang'd short and sharp*, like the shrill swallow's cry.  
*Odyssey*, xxi. 449.

The sound of felling trees in a wood:

Loud sounds the ax, redoubling strokes on strokes,  
On all sides round the forest hurls her oaks  
Headlong. Deep echoing groan the thickets brown,  
Then *russling, crackling, crashing*, thunder down.  
*Iliad*, xxiii. 144.

But when loud surges lash the sounding shore,  
The hoarse rough verse should like the torrent roar.  
*Pope's Essay on Criticism*, 369.

Dire Scylla there a scene of horror forms,  
And here Charybdis fills the deep with storms:  
When the tide rushes from her rumbling caves,  
The rough rock roars; tumultuous boil the waves.  
*Pope.*

No person can be at a loss about the cause of this beauty: it is obviously that of imitation.

That there is any other natural resemblance of sound to signification, must not be taken for granted. There is no resemblance of sound to motion, nor of sound to sentiment. We are, however, apt to be deceived by artful pronunciation: the same passage may be pronounced in many different tones, elevated or humble, sweet or harsh, brisk or melancholy, so as to accord with the thought or sentiment: such concord must be distinguished from that concord between sound and sense which is perceived in some expressions independent of artful pronunciation; the latter is the poet's work, the former must be attributed to the reader. Another thing contributes still more to the deceit: in language, sound and sense being intimately connected, the properties of the one are readily communicated to the other; for example, the quality of grandeur, of sweetness, or of melancholy, though belonging to the thought solely, is transferred to the words, which by that means resemble in appearance the thought that is expressed by them. That there may be a resemblance of articulate sounds to some that are not articulate, is self-evident; and that in fact there exist such resemblances successfully employed by writers of genius, is clear from the foregoing examples, and from many others that might be given. But we may safely pronounce, that this natural resemblance can be carried no farther: the objects of the different senses differ so widely from each other, as to exclude any resemblance; sound in particular, whether articulate or inarticulate, resembles not in any degree taste, smell, nor motion; and as little can it resemble any internal sentiment, feeling, or emotion. But must we then admit, that nothing but sound can be imitated by sound? Taking imitation in its proper sense, as importing a resemblance between two objects, the proposition must be admitted: and yet in many passages that are not descriptive of sound, every one must be sensible of a peculiar concord between the sound of the words and their meaning. As there can be no doubt of the fact, what remains is to inquire into its cause.

Resembling causes may produce effects that have no resemblance; and causes that have no resemblance may produce resembling effects. A magnificent building, for example, resembles not in any degree an heroic action; and yet the emotions they produce are concordant, and bear a resemblance to each other. We are still more sensible of this resemblance in a song, when the music is properly adapted to the sentiment: there is no resemblance between thought and sound; but there is the strongest resemblance between the emotion raised by music tender and pathetic, and that

Language. that raised by the complaint of an unsuccessful lover. Applying this observation to the present subject, it appears, that, in some instances, the found even of a single word makes an impression resembling that which is made by the thing it signifies: witness the word *running*, composed of two short syllables; and more remarkably the words *rapidity*, *impetuosity*, *precipitation*. Brutal manners produce in the spectator an emotion not unlike what is produced by a harsh and rough sound; and hence the beauty of the figurative expression, *rugged manners*. Again, the word *little*, being pronounced with a very small aperture of the mouth, has a weak and faint sound, which makes an impression resembling that made by a diminutive object. This resemblance of effects is still more remarkable where a number of words are connected in a period: words pronounced in succession make often a strong impression; and when this impression happens to accord with that made by the sense, we are sensible of a complex emotion, peculiarly pleasant; one proceeding from the sentiment, and one from the melody or sound of the words. But the chief pleasure proceeds from having these two concordant emotions combined in perfect harmony, and carried on in the mind to a full close. Except in the single case where sound is described, all the examples given by critics of sense being imitated in sound, resolve into a resemblance of effects: emotions raised by sound and signification may have a resemblance; but sound itself cannot have a resemblance to any thing but sound.

Proceeding now to particulars, and beginning with those case cases where the emotions have the strongest resemblance, we observe, first, That by a number of syllables in succession, an emotion is sometimes raised, extremely similar to that raised by successive motion; which may be evident even to those who are defective in taste, from the following fact, that the term *movement* in all languages is equally applied to both. In this manner, successive motion, such as walking, running, galloping, can be imitated by a succession of long or short syllables, or by a due mixture of both: for example, slow motion may be justly imitated in a verse where long syllables prevail; especially when aided by a slow pronunciation:

Illic inter sese magnâ vi brachia tollunt.

Georg. iv. 174.

On the other hand, swift motion is imitated by a succession of short syllables:

Quadrupedante patrem sonitu quatit ungulo campum.  
Again:

Radit iter liquidum, celeres neque commovet alas.

Thirdly, A line composed of monosyllables makes an impression, by the frequency of its pauses, similar to what is made by laborious interrupted motion:

With many a weary step, and many a groan,  
Up the high hill he heaves a huge round stone.

Odyssey, xi. 736.

First march the heavy mules securely slow;  
O'er hills, o'er dales, o'er crags, o'er rocks they go.

Iliad, xxiii. 138.

Fourthly, The impression made by rough sounds in

succession, resembles that made by rough or tumultuous motion: on the other hand, the impression of smooth sounds resembles that of gentle motion. The following is an example of both:

Two craggy rocks projecting to the main,  
The roaring wind's tempestuous rage restrain;  
Within, the waves in softer murmurs glide,  
And ships secure without their hauliers ride.

Odyssey, iii. 118.

Another example of the latter:

Soft is the strain when Zephyr gently blows,  
And the smooth stream in smoother numbers flows.

Essay on Criticism, 366.

Fifthly, Prolonged motion is expressed in an Alexandrine line. The first example shall be of a slow motion prolonged:

A needless Alexandrine ends the song:  
That, like a wounded snake, drags its slow length along.  
Ib. 356.

The next example is of forcible motion prolonged:

The waves behind impel the waves before,  
Wide-rolling, foaming high, and tumbling to the shore.  
Iliad, xiii. 1004.

The last shall be of rapid motion prolonged:

Not so when swift Camilla scours the plain,  
Flies o'er th' unbending corn, and skims along the main.  
Essay on Criticism, 373.

Again, speaking of a rock torn from the brow of a mountain:

Whirls, leaps, and thunders down, impetuous to the plain.  
Iliad, xiii. 197.

Sixthly, A period consisting mostly of long syllables, that is, of syllables pronounced slow, produceth an emotion resembling faintly that which is produced by gravity and solemnity. Hence the beauty of the following verse:

Omni sedato respondit corde Latinus.

It resembles equally an object that is insipid and uninteresting.

Tædet quotidianarum harum formarum.

Terence.

Seventhly, A slow succession of ideas is a circumstance that belongs equally to settled melancholy, and to a period composed of polysyllables pronounced slow; and hence, by similarity of emotions, the latter is imitative of the former:

In those deep solitudes, and awful cells,  
Where heav'nly-pensive Contemplation dwells,  
And ever-musing Melancholy reigns.

Pope, Eloisa to Abelard.

Eightly, A long syllable made short, or a short syllable made long, raises, by the difficulty of pronouncing contrary to custom, a feeling similar to that of hard labour:

When

When Ajax strives some rock's vast weight to throw,  
The line too labours, and the words move slow.

*Essay on Criticism*, 370.

Ninthly, Harsh or rough words pronounced with difficulty, excite a feeling similar to that which proceeds from the labour of thought to a dull writer:

Just writes to make his barrenness appear,  
And strains from hard-bound brains eight lines a year.

*Pope's Epistle to Dr Arbuthnot*, l. 181.

We shall close with one example more, which of all makes the finest figure. In the first section mention is made of a climax in sound; and in the second of a climax in sense. It belongs to the present subject to observe, that when these coincide in the same passage, the concordance of sound and sense is delightful: the reader is conscious of pleasure not only from the two climaxes separately, but of an additional pleasure from their concordance, and from finding the sense so justly imitated by the sound. In this respect, no periods are more perfect than those borrowed from Cicero in the first section.

The concord between sense and sound is not less agreeable in what may be termed an *anticlimax*, where the progress is from great to little; for this has the effect to make diminutive objects appear still more diminutive. Horace affords a striking example:

*Parturiunt montes, nascetur ridiculus mus.*

The arrangement here is singularly artful: the first place is occupied by the verb, which is the capital word by its sense as well as sound: the close is reserved for the word that is the meanest in sense as well as in sound: and it must not be overlooked, that the resembling sounds of the two last syllables give a ludicrous air to the whole.

In this article we have mentioned none of the beauties of language but what arise from words taken in their proper sense. Beauties that depend on the metaphorical and figurative power of words, are treated under the separate articles of FIGURES, PERSONIFICATION, APOSTROPHE, HYPERBOLE, METAPHOR, &c. See also ORATORY.

*Law LANGUAGE.* See *Law-Language*.

*Written LANGUAGE.* See *READING*, n° xiii.

LANGUED, in heraldry, expresses such animals whose tongue, appearing out of the mouth, is borne of a different colour from the rest of the body.

LANGUEDOC, a large and maritime province of France; bounded on the north by Quercy, Rouergue, Auvergne, and Lionnois; on the east by Dauphiny and Provence; on the west by Gascony; and on the south by the Mediterranean Sea and Roussillon. It is 225 miles in length, and 100 in breadth where broadest. The clergy are more rich and numerous here than in the rest of France, there being three archbishops and 20 bishops. Languedoc is divided into the Upper and Lower; and in general it is a very pleasant country, fertile in corn, fruits, and excellent wines; and the inhabitants carry on a considerable trade. There are many curious medicinal plants, with iron mines, quarries of marble, and turquoise stones. There is also a great deal of kelp, and on the heaths are considerable numbers of the kermes oak. The principal rivers are the Rhone, the Garonne, the Aude, the

Tarne, the Allier, and the Loire. There are also a great number of mineral springs. Thoulouze is the capital town. This province is famous for the royal canal, which divides it in two, joining the Mediterranean with the Atlantic Ocean. This canal was undertaken in 1666, and finished in 1680; the mathematician who undertook it made a basin 400 yards long, 300 broad, and seven feet deep, which is always kept full of water, and may be let out by means of a sluice on the side of the Mediterranean, as well as by another on the side of the Atlantic.

LANGUET (Hubert), born at Viteaux in Burgundy in 1518, gained great reputation by his learning and virtue, in the 16th century. Having read one of Melancthon's books at Bologna, he conceived so high an esteem for the author, that he went to Wirttemberg purposely to visit him; he arrived there in 1549, when he contracted a strict friendship with Melancthon, and embraced the Protestant religion. In 1565, he was one of the first counsellors of Augustus elector of Saxony, who employed him in several important affairs and negotiations. He was afterwards admitted to the confidence of William prince of Orange; and died at Antwerp, on the 30th of September 1581. We have many of his letters written in Latin to Sir Philip Sidney, to Camerarius the father and son, and to Augustus elector of Saxony, which have been several times reprinted, in three volumes; and there is also attributed to him a famous treatise, intitled *Vindiciæ contra Tyrannos*, and other works. His life is written by Philibert de la Mare.

LANGUET (John Baptist Joseph), the celebrated vicar of St Sulpice at Paris, and a doctor of the Sorbonne, was born at Dijon in 1675. He was received into the Sorbonne in 1698; and attached himself to the community of St Sulpice, to which parish he was of great service. M. de la Chetardie the vicar, conscious of his talents, chose him for his curate, in which capacity he officiated near ten years; and in 1714, succeeded to the vicarage. His parish-church being small and out of repair, he conceived the design of building a church suitable to the size of his parish, which he began with the sum of 100 crowns, but soon obtained considerable donations; and the duke of Orleans, regent of the kingdom, granted him a lottery, and laid the first stone of the porch in 1718. It was consecrated in 1745, after M. Languet had spared neither labour nor expence to render it one of the finest churches in the world both for architecture and ornament. Another work which did him no less honour, was the *Maison de Pensant Jesus*. This establishment consists of two parts; the first composed of about 35 poor ladies of good families, and the second of more than 400 poor women and children of town and country. The order and economy in this house, for the education and employment of so many persons, gave cardinal Fleury so high an idea of the vicar of St Sulpice, that he proposed to make him superintendent-general of all the hospitals in the kingdom; which, however, was declined. Never man took more pains than he did to procure charitable donations and legacies, which he distributed with admirable discretion: he is said from good authority to have disbursed near a million of livres to the poor annually. When there was a general dearth

Langoor  
||  
Lanius.

death in 1725, he fold, in order to relieve the poor, his household goods, pictures, and some curious pieces of furniture that he had procured with difficulty; and when the plague raged at Marfeilles, he sent large fums into Provence for the relief of the diftreffed. M. Languet was not only fingular in this warm, difinterefted, benevolent conduct, but alfo in another circumftance equally rare; and this was in the refufal of feveral bifhops that were offered him: he refigned even his vicarage in 1748; but continued to preach every Sunday at his own parifh-church, and to fupport the *Maison de Penfant Jéfus* to his death, which happened in 1750. It is obferved, that his piety and charity did not proceed from poverty of talents; for he was fenfible and lively in converfation, and his genius often difcovered itfelf in his agreeable repartees.

LANGUOR, among phyficians, fignifies great weaknefs and lofs of ftrength, attended with a dejection of mind; fo that the patients can fcarce walk, or even ftand upright, but are apt to faint away.

LANIARD, (from *Lanius*, Fr.) a fhort piece of cord or line faftened to feveral machines in a fhip, and ferving to fecure them in a particular place, or to manage them more conveniently. Such are the laniards of the gun-ports, the laniard of the buoy, the laniard of the cat-hook, &c.—The principal laniards ufed in a fhip, however, are thofe employed to extend the fhrouds and ftays of the masts by their communication with the dead-eyes, fo as to form a fort of mechanical power refembling that of a tackle.—Thefe laniards are fixed in the dead-eyes as follows: one end of the laniard is thruft through one of the holes of the upper dead-eye, and then knotted, to prevent it from drawing out; the other is then paffed through one of the holes in the lower dead-eye, whence, returning upward, it is inferted through the fecond hole in the upper dead-eye, and next through the fecond in the lower dead-eye, and finally through the third holes in both dead-eyes. The end of the laniard being then directed upwards from the loweft dead-eye, is ftretched as fteiff as poffible by the application of tackles; and that the feveral parts of it may fide with more facility through the holes in the dead-eyes, it is well fmeared with hog's-lard or tallow, fo that the ftain is immediately communicated to all the turns at once.

LANIGEROUS, an appellation given to whatever bears wool.

LANISTA, in antiquity, is fometimes ufed to fignify an executioner; but more frequently for a matter-gladiator, who taught the ufe of arms, and had always people under them ready to exhibit fhews of that kind. For this purpofe, they either purchafed gladiators, or educated children, that had been expofed, in that art.

LANIUS, the *SHRIKE*, or *Butcher-bird*, in ornithology, a genus belonging to the order of accipitres; the characters of which are thefe: The beak is fomething ftrait, with a tooth on each fide towards the apex, and naked at the bafe; and the tongue is lacerated. There are 26 fpecies, diftinguifhed by the fhape of the tail and colour. The following are thofe known in Britain.

1. The excubitor, or greater butcher-bird, weighs three ounces: its length is 10 inches; its breadth 14: its bill is black, one inch long, and hooked at the end; the upper mandible furnifhed with a fharp procefs: the

noftils are oval, covered with black bristles pointing downwards: the mufcles that move the bill are very thick and ftrong; which makes the head very large. This apparatus is quite requifite in a fpecies whole method of killing its prey is fo fingular, and whole manner of devouring it is not lefs extraordinary: fmall birds it will feize by the throat, and ftrangle; which probably is the reafon the Germans call this bird *wur-changl*, or the fuffocating angel. It feeds on fmall birds, young neftlings, beetles, and caterpillars. When it has killed the prey, it fixes them on fome thorn, and when thus fpiitted pulls them to pieces with its bill: on this account the Germans call it *thorntraer* and *thornfricker*. We have feen them, when confined in a cage, treat their food in much the fame manner, fticking it againft the wires before they would devour it. Mr Edwards very juftly imagines, that as nature has not given thefe birds ftrength fufficient to tear their prey to pieces with their feet, as the hawks do, they are obliged to have recourfe to this artifice. It makes its neft with heath and mofs, lining it with wool and goffamer; and lays fix eggs, of a dull olive green, fpecked at the thickeft end with black.

The crown of the head, the back, and the coverts that lie immediately on the joints of the wings, are afh-coloured; the reft of the coverts black: the quill-feathers are black, marked in their middle with a broad white bar; and except the four firft feathers, and the fame number of thofe next the body, are tipped with white: the tail confifts of 12 feathers of unequal lengths, the middle being the longeft; the two middlemoft are black, the next on each fide tipped with white, and in the reft the white gradually increafes to the utmoft, where the colour has entire poffeffion, or there remains only a fpot of black: the cheeks are white, but croffed from the bill to the hind-part of the head with a broad black ftroke: the throat, breaft, and belly are of a dirty white: the legs are black. The female is of the fame colour with the male, the breaft and belly excepted, which are marked tranfverfely with numerous femicircular brown lines.

2. The collurio, or leffer butcher-bird. The male weighs two ounces; the female two ounces two drams. The length of the former is feven inches and a half; the breadth eleven inches. The irides are hazel; the bill refembles that of the preceding fpecies: the head and lower part of the back are of a fine light grey: acrofs the eyes from the bill runs a broad black ftroke: the upper part of the back, and coverts of the wings, are of a bright ferruginous colour; the breaft, belly, and fides, are of an elegant bloffom colour; the two middle feathers of the tail are longeft, and entirely black; the lower part of the others white, and the exterior webs of the outmoft feather on each fide wholly fo. In the female, the ftroke acrofs the eyes is of a reddifh brown: the head of a dull ruft-colour mixed with grey; the breaft, belly, and fides, of a dirty white, marked with femicircular dufky lines: the tail is of a deep brown; the outward feather on each fide excepted, whole exterior webs are white. Thefe birds build their nefts in low bufhes, and lay fix eggs of a white colour, but encircled at the bigger end with a ring of brownifh red.

3. The woodchat in fize feems equal to the preceding: the bill is horn-coloured; the feathers that furround

Lanner  
||  
Lantern.

surround the base are whitish; above is a black line drawn cross the eyes, and then downwards each side the neck; the head and hind part of the back are of a bright bay; the upper part of the back dusky, the coverts of the tail grey, the scapulars white; the coverts of the wings dusky, the quill-feathers black, marked towards the bottom with a white spot; the throat, breast, and belly, of a yellowish white. The two middle feathers appear to be entirely black; the exterior edges and tips of the rest white; the legs black. The female differs: the upper part of head, neck, and body, are reddish, striated transversely with brown; the lower parts of the body are of a dirty white, rayed with brown; the tail is of a reddish brown, marked near the end with dusky, and tipped with red.

**LANNER**, or **LANNAR**, the name of a bird of the long-winged hawk-kind, the male of which is called the *lannaret*. Its beak and legs are blue, and its head and neck variegated with large streaks of black and white. Its back, wings, and tail, are not variegated, except with a few small white spots, and its wings, when extended, are seen speckled underneath with small round white spots. Its neck is very short, as are also its legs. It is common in France, and abides there the whole year; it is very docile, and serves all the purposes of hawking. In Italy the species seems something different, having much of a yellowish brown about the shoulders, and being indocile, and of no use in sporting.

**LANSLOWNE** (Lord). See **GRANVILLE**.

**LANTANA**, **AMERICAN VIBURNUM**; a genus of the angiospermia order, belonging to the didymia class of plants. There are seven species, consisting of shrubby exotics from Africa and America for the green-house or stove; growing to the height of a yard or two, and adorned with oblong, oval, and roundish simple leaves, with monopetalous, tubular, four-parted flowers of different colours.—They may be propagated either by seeds or cuttings.

**LANTERN**, or **LANTHORN**, a device to carry a candle in; being a kind of cover usually made of white iron, with sashes of some transparent matter, as glass, horn, &c. to transmit the light.

**Dark LANTERN**, one with only one opening, which may also be closed up when the light is to be entirely hid, or opened when there is occasion for the assistance of the light to discover some object.

**Magic LANTERN**, an optic machine, whereby little painted images are represented so much magnified, as to be accounted the effect of magic by the ignorant. See **DIOPTRICS**, Art. ix. p. 2478.

**LANTERN**, in architecture, a little dome raised over the roof of a building, to give light, and serve as a crowning to the fabric.

The term *lantern* is also used for a square cage of carpentry, placed over the ridge of a corridor or gallery, between two rows of shops, to illumine them, like that of the royal exchange London.

**LANTERN**, on ship-board, a well-known machine, of which there are many in a ship, particularly for the purpose of directing the course of other ships in a fleet or convoy; such are the poop and top lanterns, &c.

**Fest of LANTERNS**, in China, is a celebrated feast held on the 15th day of the first month; so called

from the infinite number of lanterns hung out of the houses and streets; which, it is said, is not less than two hundred millions. On this day are expoled lanterns of all prices, whereof some are said to cost 2000 crowns.—Some of their grandes retrench somewhat every day out of their table, out of their dress, equipage, &c. to appear the more magnificent in lanterns. They are adorned with gilding, sculpture, painting, jpanning, &c. And as to their size, it is extravagant; some being from 25 to 30 foot diameter: they represent halls and chambers, and two or three such machines together would make handsome houses; so that in China they are able to eat, lodge, receive visits, have balls, and act plays in a lantern. To illumine them, they should have bonfires; but as that would be inconvenient, they content themselves with lighting up in them an infinite number of torches or lamps, which at a distance have a beautiful effect. In these they exhibit various kinds of shews to divert the people.—Besides these enormous lanterns, there is a multitude of others smaller: these usually consist of six faces or lights, each about four feet high, and one and a half broad, framed in wood finely gilt and adorned; over these they stretch a fine transparent silk, curiously painted with flowers, trees, and sometimes human figures: the painting is very extraordinary, and the colours extremely bright; and when the torches are lighted, they appear highly beautiful and surprising.

**LANTERN-FLY**, in natural history, the name of a very singular kind of insect produced in the West Indies, and carrying a strong light with it in the night. The structure of the trunk of this insect is of the same kind with that of the cicada; and, as it wants the power of making the noise for which the cicada is so famous, it belongs, according to Mr Reamur's distinctions, to that species of insect called the *proscigale*, or *proscigale*.

The glow-worm, and the luminous beetles, with all the other luminous insects we are acquainted with in this part of the world, diffuse their light from a part which is near the extremity of the body, and under the belly; but the lantern-fly gives it from its head. It differs also greatly in the degree of light: for this, in all the insects we are acquainted with, is very feeble; whereas in this fly it is so strong, that Mrs Morian, who is the first that hath well described it, says she could read a small print in a dark night by the light that one of them gave. The eyes of this creature are placed very near the part from whence the light issues; and it is commonly supposed that the use of the light is to show the creature the objects it passes by in its flight; but if we consider the effect of a light so placed, in regard to ourselves, we shall find, that it would by no means answer the same purpose to us. If our whole forehead was covered with a lambent flame in the night, it would rather blind us than shew us any distant objects.—The head of this creature, strictly speaking, is very short, not exceeding the length of one of the rings of the body, if it be measured from its joining with the corelet to its joining with the lantern; but if that part be accounted a portion of the head, then the head is equal in length to the whole body.—This lantern is wider than it is deep or thick; and has, near its origin, a large protuberance

Lanugo  
Lapidary.

Lapidary,  
Lapis.

berance, which gives it a bunched or humped look. There are several tubercles and lines on it of a reddish colour. The ground colour is an olive brown; and underneath, it has one large rib running all the way along it from end to end, dividing it in two; and by the sides of that there are some others. These are all reddish, and those nearest the edges have small rows of spines running along them. Over each of the eyes there is a round granulated prominence, which seems to have been a collection of smaller eyes; and if so, the animal is supplied with the organs of vision in a different manner from all other creatures. But an examination of the creature on the spot, and while alive, is requisite to find out this. The upper pair of wings is not perfectly transparent; they are dotted with white in some places, and are variegated near their origin with several blackish spots. The under pair are more transparent than the upper; they are much shorter and broader than the others. These have each a large and beautiful round spot near the extremity, resembling that on the wing of the peacock butterfly. The colours of the circles of these eyes are brown and olive; the last colour very bright and clear, the other very dusky and obscure. The spots are so large, that they appear very beautiful.

LANUGO, the soft down of plants, like that growing on the fruit of the peach-tree. See HAIR.

LAODICEA on the Lycus, (anc. geog.), a town of Phrygia, at first called *Diopolis*, then *Rhoas*. It was built by Antiochus son of Stratonice, and called after his consort *Laodice*. Its memory is consecrated in scripture, being one of the seven churches to which St John in the Apocalypse addresses himself, commended by St Paul; the town is mentioned by Cicero as considerable for trading.

LAODICEA on the Sea, (anc. geog.), according to Strabo, was a town of Seleucia in Syria, extremely well built, with a commodious harbour. The country about it yielded great quantities of wine. The city took its name from *Laodice*, mother of Seleucus the founder of it.

LAOMEDON king of Troy, whose history is involved in fables. He built the famous walls round that city, and is said to have been killed by Hercules.

LAON, a considerable town of the Isle of France, and capital of the Laonia, with a castle and bishop's see. Its principal trade consists in corn and wine; and it is very advantageously seated on a mountain, in E. Long. 3. 42. N. Lat. 49. 34.

LAOS, a kingdom of Asia beyond the Ganges; bounded on the north, by China; on the east, by Tonquin and Cochinchina; on the south, by Cambodia; and on the west, by the kingdom of Siam, and by the territories of the king of Ava. This country is full of forests, and abounds in rice, fruits, and fish. The inhabitants are well made, robust, of an olive complexion, and mild in their disposition; but very superstitious, and much addicted to women. Their principal occupation is tilling the ground and fishing. The king shews himself but twice a-year, and has large revenues from the elephant's teeth found in his dominions. Their religion is a kind of idolatry, and much the same as in China. Langionia is the capital town.

LAPIDARY, an artificer, who cuts precious  
VOL. VI.

stones.

The art of cutting precious stones is of great antiquity. The French, though they fell into it but lately, have notwithstanding carried this art to a very great perfection, but not in any degree superior to the English.

There are various machines employed in the cutting of precious stones, according to their quality: the diamond, which is extremely hard, is cut on a wheel of soft steel, turned by a mill, with diamond-dust, tempered with olive-oil, which also serves to polish it.

The description of the diamond-cutter's wheel or mill, as represented in Plate CLXI. fig. 8. is as follows: *a* is the pincers; *b*, the screw of the pincers; *c*, the shell that carries the mastic and the diamond; *d*, the mastic that softens the diamond at the end of the shell; *e*, the diamond presented to the wheel, to be cut facetwise; *f*, the iron-wheel turning on its pivot; *g*, iron-pegs, to fix and keep the pincers steady; *h*, small pegs of lead of different weights, wherewith the pincers are loaded at pleasure to keep them steady; *i*, a wooden wheel; *k*, the axis of the wheel. It is beided, and makes an elbow under the wheel, to receive the impulsion of a bar that does the office of a turning handle; *l*, the sole, or square piece of steel, wherein the pivot of the tree or axis moves; *m*, the turning handle, that sets the wheel a-going by means of the elbow of its axis; the elbow of the piercer wherewith a hoghead is broached, will give an idea of this kind of motion; *n*, the cat-gut string that goes round both the iron and the wooden wheels. If the wooden wheel is twenty times larger than the iron one, the latter shall make twenty turns upon the diamond, whilst the large wheel makes but one round its axis; and whilst the boy gives, without any resistance, a hundred impulsions to the turning handle, the diamond experiences a thousand times the friction of the whole grinding wheel.

The diamond-cutter follows the work with his eyes, without taking any other share in it than that of changing the place of the diamond to bite on a new surface; and of timely throwing upon it, with a few drops of oil, the minute particles of the diamonds first ground one against the other, to begin the cutting of them.

The oriental ruby, sapphire, and topaz, are cut on a copper-wheel with diamond dust tempered with olive-oil, and are polished on another copper wheel with tripoli and water. The hyacinth, emerald, amethyst, garnets, agates, and other stones not of an equal degree of hardness with the other, are cut on a leaden wheel with malt and water, and polished on a tin-wheel with tripoli. The turquoise of the old and new rock, girafol, and opal, are cut and polished on a wooden wheel with tripoli also.

The lapidaries of Paris have been a corporation since the year 1290. It is governed by four jurats, who superintend their rights and privileges, visit the master-workmen, take care of the master piece of workmanship, bind apprentices, and administer the freedom.

LAPIS, in general, is used to denote a stone of any kind.

LAPIS, in Roman antiquity, a geographical measure denoting a mile; because miles were distinguish-

Lapis  
||  
Lapland.

ed by erecting a stone at the end of each; from the number marked on which, the length of way from Rome might be known. The device is by Plutarch ascribed to Caius Gracchus. This was more accurately executed by Augustus, who erected a gilt pillar in the forum, at which all the public ways of Italy, distinguished by stones, were terminated. The same thing was done in the Roman provinces. Hence the phrases *tertius lapis*, *centesimus lapis*, &c. for three, a hundred, &c. miles; and sometimes the ordinal number without *lapis*, as *ad duodecimum*, &c. at twelve miles distance.

*LAPIS Affius*, in the natural history of the ancients, the name of a stone called also *sarcophagus*, from its power of consuming flesh. See *SARCOPHAGUS*.

*LAPIS Bononiensis*, the Bolognian stone. See *CHEMISTRY*, n° 339, 340.

*LAPIS Lazuli*. See *LAZULI*.

*LAPIS Lyncurium*. See *AGARICUM* and *LYNCURIUM*.

*LAPIS Nephriticus*. See *STEATITES*.

*LAPIS Specularis*. See *SPECULARIS*.

*LAPITHÆ*. See *PELETHRIONUM*.

**LAPLAND**, the most northerly country of Europe, extending from the north cape in 71° 30' N. Lat. to the White Sea under the arctic circle, is inhabited by the same people, though the country is subject to different powers. Norwegian Lapland, under the dominion of Denmark, lies between the northern sea, the river Pais, and the lake Enarak. Swedish Lapland comprehends all the country from the Baltic to the mountains that separate Norway from Sweden. It is divided into six districts, denominated *mark* or territory; and these are distinguished by the names of rivers, such as Augnermanland, Elma, Peta, Lula, Torna, and Kiemi. The eastern part, subject to the Czar of Muscovy, situated between the lake Enarak and the White Sea, is divided into three distinct prefectures; namely, that of the sea-coast towards the north, called *Mourmankoi Leporie*; the Terskoi Leporie, upon the coast of the White Sea; and the third, or inland, known by the name of *Bellamorskoi Leporie*. In Swedish Lapland, which is the most considerable of the three, the provinces or marks are subdivided into smaller districts called *biars*, consisting each of a certain number of families; among which the land is parcelled out by government, or the prefect of the district appointed by the king of Sweden.

Lapland may be termed a huge congeries of frightful rocks and stupendous mountains; interspersed, however, with many pleasant valleys, watered by an infinite number of rivulets that run into the rivers and lakes, which discharge themselves into the gulf of Bothnia. The names of the principal lakes in Lapland are the Great Uma, the Great Windel, the Oreavan, the Stor-avan, the Great Lula; the lakes of Kartom, Kali, Torno, Enara, and Kimi. Some of these extend 60 leagues in length, and contain a great number of islands: Stor-avan is said to contain 365; and Enara contains an archipelago of islands so large, that no Laplander has lived long enough to visit each particular island. The natives believe this country to be the terrestrial paradise; and indeed nothing could be more enchanting than such vast prospect of mountains, hills, forests, lakes, rivers, &c.

if the country was in a moderate climate; and indeed, even here, in summer the roses are seen blowing wild on the banks of the lakes and rivers, with all the beautiful glow of colour which appears in those cultivated in our gardens. But all the intervals between the mountains are not engrossed by these agreeable prospects; great part of the flat country is covered with brown dusky forests of fir and pine trees; and these are often skirted by wide extended morasses, the stagnating waters of which in summer produce myriads of mischievous insects, that are more intolerable than even the cold of winter.

The cold of Lapland is very intense during the winter, freezing even brandy and the watery part of spirit of wine, if the latter is not highly rectified: the very breath freezes in expiration; and the limbs of people are often mortified, and perish; all the lakes and rivers are frozen to a prodigious thickness; and the whole face of the country is covered with snow to the depth of four or five feet. While this continues loose, it is impossible to travel; for a man's eyes are not only blinded with it, but if a strong wind should rise he will be buried in the drifts of snow: yet should a partial thaw take place for a few hours, the surface of this snow is formed by the succeeding frost into a hard impenetrable crust, over which the Laplander travels in his sledge with great celerity. While the thaw prevails, the air is furcharged with vapours, and the climate is rainy; but while the north wind blows, the sky is beautifully serene, and the air very clear.

The heat of summer is almost as intolerable in Lapland as the cold of winter. At the northern extremity of the country the sun never sets for three months in summer, and in winter there is an uninterrupted night of the same duration; but this is qualified in such a manner by a constant revolution of dawn and twilight, by a serene sky, moon-light, and aurora borealis, reflected from the white surface of the earth covered with snow, that the inhabitants are enabled to hunt, fish, and proceed with their ordinary occupations. The country abounds with excellent springs; and is remarkable for some surprising cataraets, in which the water rumbles over frightful precipices, and dashes among rocks with amazing impetuosity and noise.

The soil of Lapland is generally so chilled and barren, that it produces little or no grain or fruit-trees of any kind. This sterility, however, is not so much owing to the soil, which is in many places of a rich mould, as to want of industry; for in some districts the Swedes have tilled and manured pieces of ground that bear plentiful crops of rye. There is also great plenty of berries: such as black currants; what is called the Norwegian mulberry, growing upon a creeping plant, and much esteemed as an antiscorbutic; rasp-berries, cran-berries, juniper-berries, and bilberries. The tops of the mountains are so much exposed to intense cold, and tempests of snow and hail, that no tree will grow near the summit; but in parts that are more sheltered, we see fine woods of birch, pine, and fir, disposed by nature as if they had been planted by art in rows at regular distances, without any undergrowth or incumbrance below. Besides these trees, some parts of Lapland produce the service-tree, the willow, the poplar, the elder, and the cornel. Among the plants

Lapland. of this country the principal is the angelica; which is greatly esteemed by the natives, who use it in their food. Here is likewise the acetosa or sorrel, which grows in great plenty, and is of much service on account of its antiscorbutic properties. They have also other kinds of herbs peculiar to the country, different kinds of grafs, heath, and fern; which are all enumerated in a work of the celebrated Linnæus, intitled *Flora Laponica*. But the vegetable which is in greatest plenty, and of the most extensive use among them, is the moss; of which there are many different species, either adhering to trees, or growing on the surface of the earth. The rein-deer is almost wholly sustained by this vegetable; which indeed he prefers to all others, and without which he cannot subsist. The Laplanders not only use it as forage to their cattle, but boil it in broth as a cordial and restorative. They likewise use one sort of it as a soft, easy, and wholesome bed for their new-born children.

Some silver and lead mines have been discovered in the provinces of Pitha and Lulå; and two of copper, together with excellent veins of iron, in the district of Torno; but they are not at present worked with any considerable advantage. In some places there are veins of silver and gold mixed; but these mines are worked only for a few months in the summer, because the frost hinders the engines from playing. Here are found beautiful crystals, of a surprising magnitude, so hard and fine, that when polished they resemble real diamonds. In some places amethysts and topazes are also found, but pale and cloudy; also a great quantity of very curious stones, which are too hard to be worked by the tool of the mason. Some of these found on the banks of rivers and lakes, when they happen to bear the least resemblance to the figures of animals, the Laplanders remove to more conspicuous places, and adore as deities. The province of Torno affords some curious stones of an octagonal shape, regular, shining, and polished by the hand of nature. In some rivers they fish for pearls, which are generally pale; but some of them are as bright as the oriental pearls, and much larger and rounder. These pearls are found in muscle-shells; and the fishery is not in the sea, but in rivers.

Lapland, as well as Norway, is infested with a great number of grey wolves and bears, with whom the inhabitants wage perpetual war. The most honourable exploit among the Laplanders is that of killing a bear; and the heroes adorn their caps with a small plate of lead or pewter for every bear they have slain. The country abounds also with elks, beavers, and otters, which live here unmolested, and find plenty of fish for their subsistence. The skins of the black foxes in Lapland are of such estimation, that a single one will sell at Moscow for 12 golden crowns. The forests of this country furnish haunts to a great number of beautiful martens and squirrels; which last change their colour every winter from brown to grey. These animals frequently migrate in vast multitudes. When they arrive at the side of a lake, they embark on pieces of timber or bark, which they find afloat, and are generally drowned on their passage: the bodies are cast ashore, and the skin becomes a prey to the first finder. What should induce these animals to quit the country and to undertake such hazardous voyages, hath not yet

been discovered.

Lapland is also the native country of the zibelling, a creature resembling the martin, whose skin, whether black or white, if glossy, is extremely valuable, and often given in presents by the ambassadors of Muscovy to the princes at whose courts they reside. Here are likewise ermines, weasels, hares which grow white in winter, large black cats which attend the Laplanders in hunting, and little prick-eared curs trained to the game. But the most remarkable animal of Lapland is the rein-deer, of which an account is given in the article CERVUS, n° 4.—The woods, mountains, and rivers are well stocked with wild-fowl; such as bustard, partridge, grouse, heathcock, pheasants, lapwings, swans, wild-geese, wild-ducks, and all sorts of aquatic birds that build and breed in northern climates. In the beginning of the spring the swans go thither in numerous flocks from the German ocean; the lapwings follow in such swarms that they darken the sky as they pass along, and scream so loud that they may be heard at a great distance. The rocks and mountains are likewise frequented by eagles, hawks, falcons, kites, and other birds of prey.—The rivers abound with delicious salmon from the gulph of Bothnia, trout, bream, and perch of exquisite flavour and amazing magnitude; and the inhabitants of Wardhus, or Danish Lapland, are well supplied with fish from the northern ocean.—With respect to insects, the flies hatched in the morasses and woods in summer are so numerous, that they often obscure the face of day; so venomous, troublesome, and intolerable, that the rein-deer fly to the tops of the highest mountains for shelter, and the Laplanders betake themselves to the seaside, which is the least infested by these pestilent vermin. M. de Maupertuis, in his account of the voyage he made to Lapland, in company with the other French mathematicians sent thither by the king to measure a degree of the meridian, gives us to understand, that on the tops of the mountains in Torno the flies were so troublesome, that even the Finland soldiers, who are counted the most hardy troops in the service of Sweden, were obliged to cover their faces with the skirts of their coats, from the attacks of these animals, which swarmed to such a degree, that the moment a piece of flesh appeared it was blackened all over. Some of these flies are very large, with green heads, and fetch blood from the skin wherever they strike. The Laplanders shroud themselves in the smoke of a large fire kindled for that purpose; yet even this disagreeable expedient was not sufficient to defend the French philosophers: they were obliged, notwithstanding the excessive heat, to wrap up their heads in garments made of the skins of rein-deer, called in that country *lapnades*, and to cover themselves with a thick rampart of fir-boughs; yet all these precautions proved ineffectual. M. de Maupertuis observed a lake quite covered with little yellowish grains, resembling millet seed, which he supposed to be the chrysalides of some of these insects.

Lapland is so far from being populous, that the whole nation is not equivalent in number to the inhabitants of one petty province of France. The Laplanders are very low in stature, generally about a head shorter than other Europeans. They are likewise remarkable for having large heads. M. de Maupertuis

Lapland. measured a female Laplander who suckled her own child, and found her stature did not exceed four feet two inches and five lines. They are also ill-shaped and ugly: yet strong, hardy, and robust, inasmuch that will bear incredible fatigue; and it is remarked that the stoutest Norwegian is not able to bend the bow of a Laplander. The women, however, are much less homely than the men, and many of them are noted for a delicate and florid complexion.

These people are simple, honest, hospitable, and timorous: their timidity, however, respects war alone; for to many other species of dangers they expose themselves with surprising intrepidity, whether in ascending and descending mountains and precipices with their snow-shoes and in sledges, or in venturing amidst whirlpools and cataracts in little slender boats made of thin fir-boards, fastened together with thongs of leather, sinews of wild beasts, or tough and flexible twigs of willow and osier. These boats are of different sizes, from two to six yards in length, managed with oars, and caulked with moss, so tight as to keep out the water. The Laplanders are more or less civilized as they communicate with strangers, or live among woods and forests sequestered from all correspondence. The mountaineers live chiefly on the flesh and on the milk of the rein-deer; the flesh they dry in the cold, and from the milk they make abundance of cheese. Those who live in the low country feed on venison and fish. They have neither bread nor salt; but in lieu of both use the inner rind of the pine-tree dried and ground, and dried fish reduced to powder. They make confections and decoctions of berries, angelica, and fennel, which they justly reckon to be preservatives against the scurvy. They make broth of fish and flesh boiled together; and their usual drink is water heated in a kettle which hangs continually over the fire in winter. Their greatest dainty, however, is bear's flesh, which they eat on all great festivals. On these occasions also they indulge themselves with brandy, and are never so happy as when they can enjoy a pipe of tobacco. These commodities, together with a few cows and sheep for their winter store, the better sort of Laplanders purchase from Norway.

They lodge in wretched houses composed of rafters joined together, and covered partly with turf, and partly with the boughs or bark of pine-trees, and a coarse kind of cloth. Each hut is furnished with two doors, one smaller than the other: at the former the men pass forth to their hunting and other occupations; but no woman is permitted to make use of this entry, lest she should meet the man in his outgoing, which their superstition interprets into a very bad omen. They have neither chimney nor window; but a hole at the top, which lets in the light and lets out the smoke. In a word, these habitations are no more than miserable hovels, without convenience or comfort; in which the people sit or lie promiscuously like beasts around the fire, enveloped in a thick impetuous gloom of acrid smoke, which corrodes their eyes and renders the atmosphere altogether unfit for respiration. Yet even here the poor Laplander enjoys life with some degree of relish: he has his fashions, his diversions, and his amours. He is secured in the possession of uninterrupted health by temperance and exercise, which, together with the severity of the cli-

mate, brace his nerves to a very unusual pitch of strength, and fortify his constitution in such a manner, that he often lives to the age of 100, without feeling the least pang of distemper, or even perceiving his vigour in the least impaired; for it is not uncommon to see a Laplander in extreme old age hunting, fowling, skating, and performing all the severest exercises with undiminished agility.

The summer-garb of the men consists of a long coat of coarse cloth, reaching down the middle of the leg, and girded round the waist with a belt or girdle; from which hang a Norway knife, and a pouch containing flints, matches, tobacco, and other necessities; the girdle itself being decorated with brass rings and chains. Their caps are made of the skin of the northern diver, with the feathers on; and their shoes of the rein-deer skin, with the hair outwards. They wear no linen; but the garments of the better sort are of a finer cloth, and they delight in a variety of colours, though red, as the most glaring, is the most agreeable. In winter they are totally cased up in coats, caps, boots, and gloves, made of the rein-deer skins with the hair inwards. The women's apparel differs very little from that of the other sex; only their girdles are more ornamented with rings, chains, needle-cases, and toys that sometimes weigh 20 pounds. In winter, both men and women lie in their furs; in summer, they cover themselves entirely with coarse blankets to defend them from the gnats which are intolerable. The Laplanders are not only well disposed, but naturally ingenious. They make all their own furniture, their boats, sledges, bows and arrows. They form neat boxes of thin birch-boards, and inlay them with the horn of the rein-deer. The Swedes are very fond of the Lapland baskets made of the roots of trees, slit in long thin pieces, and twisted together so nicely that they will hold water. Among the manufactures of this country we likewise number curious horn-spoons, and moulds in which they cast the trinkets of tin which adorn their girdles. Over and above these domestic occupations, the men within doors perform the office of cooks, in dressing victuals for the family. The women act as taylor and embroiderers; they make clothes, shoes and boots, and harness for the rein-deer: they spin thread of fur, and knit it into caps and gloves, that are very soft and warm. They draw tin into wire through a horn; and with this they cover the thread which they use in embroidering the figures of beasts, flowers, trees, and stars upon their caps and girdles.

The Laplanders make surprising excursions upon the snow in their hunting expeditions. They provide themselves each with a pair of skates, or snow-shoes, which are no other than fir-boards covered with the rough skin of the rein-deer turned in such a manner that the hair rises against the snow, otherwise they would be too slippery. One of these shoes is usually as long as the person who wears it, the other is about a foot shorter. The feet stand in the middle, and to them the shoes are fastened by thongs or withes. The Laplander thus equipped wields a long pole in his hand, near the end of which there is a round ball of wood, to prevent its piercing too deep in the snow; and with this he stops himself occasionally. By means of these accoutrements he will travel at the rate of 60 miles a-day without being fatigued; ascending steep

mountain-

Lapland. mountains, and sliding down again with amazing swiftness.

The Laplander not only travels a-foot, but is provided with a carriage drawn by the rein-deer, in which he journeys with still greater rapidity. The sledge, called *pulka*, is made in the form of a small boat, with a convex bottom, that it may slide the more easily over the snow: the prow is sharp and pointed; but the sledge is flat behind. The traveller is swathed in this carriage like an infant in a cradle, with a flick in his hand, to steer the vessel, and disengage it from pieces of rock or stumps of trees that may chance to encounter it in the route. He must also balance the sledge with his body, otherwise he will be in danger of being overturned. The traces, by which this carriage is fastened to the rein-deer, are fixed to a collar about the animal's neck, and run down over the breast, between the fore and hind legs, to be connected with the prow of the sledge: the reins, managed by the traveller, are tied to the horns; and the trappings are furnished with little bells, the sound of which is agreeable to the animal. With this draught at his tail, the rein-deer will fly like lightning over hill and dale, so as to run at the rate of 200 miles a-day. Before he sets out, the Laplander whistles in his ear the way he is to follow, and the place at which he is to halt; firmly persuaded, that the beast understands his meaning: but, in spite of this intimation, he frequently stops short, long before he has reached the journey's end; and sometimes he overshoots the mark by several leagues. The posture of a man in one of these pulkhas is half-sitting and half-lying, so as to be extremely confined and uneasy. In the beginning of winter, the Laplanders mark the most frequented roads, by strewing them with fir-boughs; and, indeed, these roads are no other than pathways made through the snow by the rein-deer and the pulkhas: their being frequently covered with new snow, and alternately beaten by the carriage, consolidates them into a kind of causeway; which is the harder, if the surface has felt a partial thaw and been crusted by a subsequent frost. It requires great caution to follow these tracks; for, if the carriage deviates to the right or left, the traveller is plunged into an abyss of snow. In less frequented parts, where there is no such beaten road, the Laplander directs his course by certain marks which he has made on the trees; but, notwithstanding all his caution, the rein-deer very often links up to the horns in snow. Should a hurricane arise, the snow would be whirled about in such a manner as to blind and overwhelm the traveller, unless he should be provided with a tent to screen him in some measure from the fury of the tempest.

The chief occupation of the Laplanders is hunting, and this exercise they perform in various ways. In summer, they hunt the wild beasts with small dogs, drained to the diversion. In winter, they pursue them by their tracks upon the snow, skating with great velocity, that they very often run down the prey. They catch ermines in traps, and sometimes with dogs. They kill squirrels, martens, and fables, with blunt darts, to avoid wounding the skin. Foxes and beavers are slain with sharp-pointed darts and arrows; in shooting which, they are accounted the best marksmen in the world. The larger beasts, such as bears, wolves,

elks, and wild rein-deer, they either kill with fire-arms purchased in Sweden or Norway, or taken in snares and pits dug in the forests. Their particular laws, relating to the chase, are observed with great punctuality. The beast becomes the property of the man in whose snare or pit he is caught; and he who discovers a bear's den, has the exclusive privilege of hunting him to death. The conquest of a bear is the most honourable achievement that a Laplander can perform; and the flesh of this animal they account the greatest delicacy on earth. The bear is always dispatched with a fusil, sometimes laid as a snare, ready cocked and primed; but more frequently in the hands of the hunter, who runs the most imminent risk of his life, should he miss his aim of wounding the beast mortally. The death of a bear is celebrated by the Laplanders as a signal victory. The carcass is drawn to the cabin or hut of the victor by a rein-deer, which is kept sacred from any other work for a whole year after this service. The bear is surrounded by a great number of men, women, and children, reciting a particular hymn or song of triumph; in which they thank the vanquished enemy for having allowed himself to be overcome without doing any mischief to his conqueror, and welcome his arrival: then they make an apostrophe to heaven, expressing their acknowledgment to God, that he has created beasts for the use of men, and endued mankind with strength and courage to overcome and attack the fiercest of the brute creation. The hero is saluted by the women, who spit chewed elder-bark in his face. He is feasted three days successively, and his cap is decorated with an additional figure wrought in tin-wire.

The manner in which the young Laplander chooses a wife is equally remarkable and ludicrous. When he has pitched upon a female, he employs some friends as mediators with the father; and these being provided with some bottles of brandy, the suitor accompanies them to the hut of his future father-in-law, who invites the mediators to enter; but the lover is left without, until the liquor be drank and the proposal discussed: then he is called in, and entertained with such fare as the hut affords; yet without seeing his mistress, who retires and goes out on this occasion. Having obtained leave of her parents to make his address in person, he puts on his best apparel, and is admitted to the lady, whom he salutes with a kiss: then he presents her with the tongue of a rein-deer, a piece of beaver's flesh, or some other sort of provision. She declines the offer, which is made in presence of her sisters and relations; but makes a signal to the lover to follow her into the fields, where she accepts the presents. Thus encouraged, he begs her permission to sleep with her in the hut; if she consents, there is no further difficulty; if she disapproves of the proposal, she drops her presents on the ground. When the lovers are agreed, the youth is permitted to visit his inamorata as often as he shall think proper: but every time he comes, he must purchase this pleasure with a fresh bottle of brandy; a perquisite so agreeable to the father, that he often postpones the celebration of the nuptials for two or three years. At length the ceremony is performed at church, by the priest of the parish. Even after this event, the husband is obliged to serve his father-in-law a whole year; at the expiration of

Lapland. of which he retires to his own habitation with his wife, and her patrimony of rein-deer, and receives presents from all his friends and relations. From this period he sequesters his wife from the company of all strangers, especially of the male sex, and watches over her conduct with the most jealous vigilance.

Many Lapland women are barren, and none of them are very fruitful. A woman, immediately after delivery, swallows a draught of whale-fat: the child is washed with snow or cold water, and wrapped up in a hare-skin. The mother is seldom above five days in the straw, and in fourteen is generally quite recovered: then she carries the child to church to be baptized. Before she can reach the residence of the priest, she is often obliged to traverse large forests, mountains, lakes, and wide-extended wastes of snow. The infant is fastened in a hollowed piece of wood, stretched naked on a bed of fine moss, covered with the soft skin of a young rein-deer, and slung by two straps to the back of the mother, who always suckles her own child. At home this little cradle is hung to the roof of the hut, and the child lulled asleep by swinging it from one side to the other. The boys, from their infancy, practise the bow; and are not allowed to break their fast, until they have hit the mark. The female children are as early initiated in the business peculiar to their sex.

These people, though for the most part vigorous and healthy, are not altogether exempted from distemper. They are subject to sore eyes, and even to blindness, from the smoke of their huts, and the fire to which they are almost continually exposed. Some waste away in consumptions; others are afflicted with rheumatic pains, and the scurvy; and a few are subject to vertigo and apoplexy. For the cure of all their internal disorders, they use no other medicine than the decoction of a certain species of moss; and, when this cannot be procured, they boil the stalk of angelica in the milk of the rein-deer. In order to remove a fixed pain, they apply a large mushroom, burning hot, to the part affected; and this produces a blister, which is supposed to draw off the peccant humour. To their wounds they apply nothing but the turpentine that drops from the fir-tree. When they are frost-bitten, they thrust a red-hot iron into a cheese made of rein-deer's milk, and with the fat that drops from it anoint the frozen member, which generally recovers. When a Laplander is supposed to be on his death-bed, his friends exhort him to die in the faith of Christ, and bear his sufferings with resignation, by remembering the passion of our Saviour. They are not, however, very ready to attend him in his last moments; and as soon as he expires, quit the place with precipitation, apprehending some injury from his spirit or ghost, which they believe remains with the corpse, and takes all opportunities of doing mischief to the living. The deceased is wrapped up in woollen or linen, according to his circumstances, and deposited in a coffin by a person selected for that purpose: but this office he will not perform, unless he is first secured from the ill offices of the manes, by a consecrated brafs ring fixed on his left arm. The Christian religion in this country has not yet dispelled all the rites of heathenish superstition: together with the body they put into the coffin an ax, a flint, and steel, a stalk of brandy, some

dried fish and venison. With the ax the deceased is supposed to hew down the bushes or boughs that may obstruct his passage in the other world: the steel and flint are designed for striking a light, should he find himself in the dark at the day of judgment; and on the provision they think he may subsist during his journey.

The Muscovite Laplanders observe other ceremonies, that bear an affinity to the superstitions of the Greek church. They not only supply the deceased with money, but likewise provide him with money for the porter of paradise, and a certificate signed by the priest, and directed to St Peter, specifying, that the bearer had lived like a good Christian, and ought to be admitted into heaven. At the head of the coffin they place a little image of St Nicholas, who is greatly revered in all parts of Muscovy as a friend to the dead. Before the interment, the friends of the deceased kindle a fire of fir-boughs near the coffin, and express their sorrow in tears and lamentations. They walk in procession several times round the body, demanding, in a whining tone, the reason of his leaving them on earth. They ask whether he was out of humour with his wife; whether he was in want of meat, drink, clothing, or other necessities; and whether he had not succeeded in hunting and fishing? These, and other such interrogations, to which the deceased makes no reply, are intermingled with groans and hideous howlings; and, between whiles, the priest sprinkles the corpse and the mourners alternately with holy water. Finally, the body is conveyed to the place of interment on a sledge, drawn by a rein-deer; and this, together with the cloaths of the deceased, are left as the priest's perquisite. Three days after the burial, the kinsmen and friends of the deceased are invited to an entertainment, where they eat the flesh of the rein-deer which conveyed the corpse to the burying-ground. This being a sacrifice to the manes, the bones are collected into a basket and interred. Two thirds of the effects of the deceased are inherited by his brothers, and the remainder divided among his sisters: but the lands, lakes, and rivers, are held in coparceny by all the children of both sexes, according to the division made by Charles IX. of Sweden, when he assigned a certain tract of land to each family.

The commerce of the Laplanders is more considerable than one would expect in a desert country inhabited by a savage ignorant people. They export great quantities of fish to the northern parts of Bothnia and White Russia. They likewise trade with the neighbouring countries of Norway, Sweden, Muscovy, and Finland, by selling rein-deer, fine furs, baskets and toys of their own manufacture, dried pikes, and cheese made of the rein-deer's milk. In return for these commodities they receive rixdollars, woollen cloaths, linen, copper, tin, flour, oil, hides, needles, knives, spirituous liquors, tobacco, and other necessities. The Laplanders march in caravans to the fairs in Finland and Norway: these are composed of a long string of 30 or 40 rein-deer and pulkhas, tied to one another, the foremost being led by a Laplander a-foot. When they have chosen a spot for an encampment, which is often in the midst of a river, they form a large circle of their rein-deer and pulkhas ready yoked;

Laplyfia  
Larceny.

yoked; and the animals, lying down quietly on the snow, are fed with moss by their masters. The people kindle great fires, around which, men, women, and children sit, and sup on dried fish: but the more voluptuous pitch their tents on the ice, and spread their bear-skins, on which they lie at their ease, and smoke tobacco.

The revenue arising from this country is of no great consequence: it is paid partly in rix-dollars, but chiefly in furs; nay, some, that can procure neither, pay the tribute in dried pikes. The produce of the mines forms likewise a considerable article. Fifty squirrel-skins, or one fox-skin, with a pair of Lapland shoes, are valued at one rixdollar. Part of the taxes is allotted for the maintenance of the Lapland clergy.

The frightful aspect of this country has been deemed a more effectual defence than artificial bulwarks and garisons, of which here are none; or than the arms and courage of the natives, who are neither warlike in themselves, nor in the least tinctured with discipline.

late  
LXII.  
g. 5.

LAPLYSIA, a genus of marine insects, belonging to the order of vermes mollusca. The body is covered with membranes reflected. It hath a shield-like membrane on the back, a lateral pore on the right side; the vent on the extremity of the back, with four feelers resembling ears. The figure shews the common size. Those of Italy grow to the length of eight inches. Pliny callit *ossa informis*; and, placing it among the venomous marine animals, says that even the touch is infectious. The smell is extremely nauseous.

LAPSANA, NIPPLEWORT; a genus of the polygamia equalis order, belonging to the syngenesia class of plants. There are four species, which grow commonly as weeds by the sides of ditches. The young leaves of the common kind, called *dock-cresses*, have the taste of radishes, and are eaten raw at Constantinople as a salad. In some parts of England the common people boil them as greens, but they have a bitter and disagreeable taste.

LAPWING, in ornithology. See TRINGA.

LAQUEUS, in surgery, a kind of ligature, so contrived, that, when stretched by any weight or the like, it draws up close. Its use is to extend broken or disjunct bones to keep them in their places while they are set, and to bind the parts close together.

LAR-BOARD, among seamen, the left-hand side of the ship when you stand with your face towards the head.

LARCENY, or THEFT, by contraction for *latrocinium*, is distinguished by the law into two sorts: the one called *simple larceny*, or plain theft unaccompanied with any other atrocious circumstance; and *mixed or compound larceny*, which also includes in it the aggravation of a taking from one's house or person.

I. *Simple larceny*, when it is the stealing of goods above the value of twelvpence, is called *grand larceny*; when of goods to that value, or under, is *petit larceny*: offences, which are considerably distinguished in their punishment, but not otherwise. See THEFT.

II. *Mixed, or compound larceny*, is such as has all the properties of the former, (see THEFT;) but is

accompanied with either one, or both, of the aggravations of a taking from one's *house or person*. First therefore of larceny from the *house*, and then of larceny from the *person*.

I. Larceny from the *house*, though it might seem to have a higher degree of guilt than simple larceny, yet is not at all distinguished from the other at common law: unless where it is accompanied with the circumstance of breaking the house by night; and then it falls under another description, viz. that of burglary, (see BURGLARY). But now by several acts of parliament (the history of which is very ingeniously deduced by a learned modern writer †, who hath † *Barr. 375.* shewn them to have gradually arisen from our improvements in trade and opulence) the benefit of clergy is taken from larcenies committed in an house in almost every instance: except that larceny of the stock or utensils of the plate-glass company from any of their houses, &c. is made only single felony, and liable to transportation for seven years. The multiplicity of the general acts is apt to create some confusion; but upon comparing them diligently we may collect, that the benefit of clergy is denied upon the following domestic aggravations of larceny; viz. first, in larcenies above *Blackst. Comment.* the value of *twelvpence*, committed, 1. In a church or chapel, with or without violence, or breaking the same: 2. In a booth or tent in a market or fair, in the day-time or in the night, by violence or breaking the same; the owner or some of his family being therein: 3. By robbing a dwelling-house in the day-time (which *robbing* implies a breaking), any person being therein: 4. In a dwelling-house by day or by night, without breaking the same, any person being therein and put in fear; which amounts in law to a robbery: and in both these last cases the accessory before the fact is also excluded from his clergy. Secondly, in larcenies to the value of *five shillings*, committed, 1. By breaking any dwelling house, or any out-house, shop, or warehouse thereunto belonging, in the day-time, although no person be therein; which also now extends to aiders, abettors, and accessories before the fact: 2. By privately stealing goods, wares, or merchandise in any shop, warehouse, coach-house, or stable, by day or by night; though the same be not broken open, and though no person be therein: which likewise extends to such as assist, hire, or command the offence to be committed. Lastly, in larcenies to the value of *forty shillings* in a dwelling-house, or its out-houses, although the same be not broken, and whether any person be therein or not; unless committed against their masters by apprentices under the age of 15. This also extends to those who aid or assist in the commission of any such offence.

2. Larceny from the *person* is either by *privately* stealing; or by open and violent assault, which is usually called *robbery*.

The offence of *privately* stealing from a man's *person*, as by picking his pocket or the like, privily, without his knowledge, was debarred of the benefit of clergy, so early as by the statute 8 Eliz. c. 4. But then it must be such a larceny, as stands in need of the benefit of clergy, viz. of above the value of 12d.; else the offender shall not have judgment of death. For the statute creates no new offence; but only takes away the benefit of clergy, which was a matter of grace, and

Lardner  
||  
Lares.

and leaves the thief to the regular judgment of the ancient law. This severity (for a most severe law it certainly is) seems to be owing to the ease with which such offences are committed, the difficulty of guarding against them, and the boldness with which they were practised (even in the queen's court and presence) at the time when this statute was made: besides that this is an infringement of property in the manual occupation or corporal possession of the owner, which was an offence even in a state of nature. And therefore the *faccularii*, or cutpurves, were more severely punished than common thieves by the Roman and Athenian laws.

As to open and violent larceny from the person, see ROBBERY.

LARDNER (Nathaniel), an eminent English dissenting divine, born in 1656, was author of several excellent works in defence of our religion; as, Testimonies of the ancient Jews and Pagans in favour of Christianity; The history of heretics, &c. He died in 1678.

LAR, a town of Persia, in the province of Fars, with a castle. It carries on a great trade in silk; and its territory abounds in oranges, lemons, and very large tamarinds. E. Long. 54. 15. N. Lat. 27. 30.

LARACHA, an ancient and strong town of Africa, in the kingdom of Fez. It is seated at the mouth of a river of the same name, with a good harbour. It was once in the possession of the Spaniards; but the Moors took it from them. W. Long. 5. 55. N. Lat. 35. 0.

LAREDO, a sea-port town of Spain, in the bay of Biscay, with a large safe harbour. It is 30 miles west of Bilbao, and 72 north by west of Burgos. W. Long. 3. 45. N. Lat. 43. 23.

LARES, certain inferior deities among the ancient Romans, who were the guardians of houses; they were also sometimes taken for the guardians of streets and ways, and Tibullus makes them the guardians of the fields. According to Ovid, they were the sons of Mercury and Laura, whose tongue was cut out by Jupiter because he revealed his adulteries to Juno: and not contented with this, he delivered her to Mercury, with orders to conduct her to hell; but this god falling in love with her by the way, had twins by her, who from their mother were called *lares*.

These domestic deities were sometimes represented under the figure of a dog, the symbol of fidelity; because dogs have the same function as the *lares*, which is to guard the house. At other times their images were covered with the skin of a dog, and had the figure of that domestic animal standing by them. The principal sacrifices to the *lares* were incense, fruit, and a hog.

The Romans had a private place in their houses, called *lararium*, in which, among other statues of their gods, were their *lares*, and the images of their ancestors. Tertullian tells us, that the custom of worshipping the *lares* arose from their anciently interring their dead in their houses; whence the credulous people took occasion to imagine, that their souls continued there likewise, and thence proceeded to pay them divine honours. To which may be added, that the custom of burying them in the highways might occasion their being considered likewise as gods of the

highways.

LARINO, a town of Italy, in the kingdom of Naples, in the Capitanata, with a bishop's see. E. Lon. 15. 51. N. Lat. 41. 48.

LARISSA, an ancient, rich, and celebrated town of Greece, in the province of Janna, or Thessaly, with an archbishop's see of the Greek church, a palace, and several handsome mosques. According to Virgil, it is the country of Achilles, and the place where Philip the father of Alexander the Great resided. The inhabitants carry on a considerable trade. The city is agreeably seated on the river Peneus, in E. Long. 23. 36. N. Lat. 38. 51.

LARIX, the LARCH-TREE; a genus of plants by Linnæus classed along with the Pinus; but as Tournefort and all former botanists have separated them on account of the form of their leaves, and they are pretty generally known by these distinctions, we shall adopt the distinction in order to avoid confusion.

*Species.* There are two species, viz. the decidua, with deciduous leaves, and oval obtuse cones; and the cedar of Libanus. The first sort grows naturally upon the Alps and Apennines, and of late has been very much propagated in Britain. It is of quick growth, and the trunk rises to 50 feet or more; the branches are slender, their ends generally hanging downward, and are garnished with long narrow leaves which arise in clusters from one point, spreading open above like the hairs of a painter's brush: they are of a light green, and fall away in autumn. In the month of April the male flowers appear, which are disposed in form of small cones; the female flowers are collected into oval obtuse cones, which in some species have bright purple tops, and in others they are white: these differences are accidental; the cones are about an inch long, obtuse at their points; the scales are smooth, and lie over each other: under each scale there are generally lodged two seeds which have wings. There are other two varieties of this tree, one of which is a native of America and the other of Siberia. The cones of the American kind which have been brought to Britain seem in general to be larger than those of the common sort.

The second sort, or cedar of Libanus, is a tree of antiquity; and what is remarkable, it is not to be found as a native in any other part of the world, as far as hath yet been discovered. What we find mentioned in Scripture of the lofty cedars, can be noways applicable to the common growth of this tree; since, from the experience we have of those now growing in England, as also from the testimony of several travellers who have visited those few remaining trees on mount Libanus, they are not inclined to grow very lofty, but on the contrary extend their branches very far; to which the allusion made by the Psalmist agrees very well, when he is describing the flourishing state of a people, and says, "They shall spread their branches like the cedar-tree."

Rauwolf, in his Travels, says, there were not at that time (i. e. anno 1574) upon mount Libanus more than 25 trees remaining, 24 of which stood in a circle: and the other two, which stood at a small distance, had their branches almost consumed with age; nor could he find any younger tree coming up to succeed them, though he looked about diligently for some.

These

Larix  
||  
Larix.

Lark. These trees (he says) were growing at the foot of a small hill, on the top of the mountains, and amongst the snow. These having very large branches, commonly bend the tree to one side, but are extended to a great length, and in so delicate and pleasant order, as if they were trimmed and made even with great diligence, by which they are easily distinguished, at a great distance, from fir-trees. The leaves (continues he) are very like to those of the larch-tree, growing close together in little branches upon small brown shoots.

Maundrel, in his Travels, says, there were but 16 large trees remaining when he visited the mountains, some of which were of a prodigious bulk, but that there were many more young ones of a smaller size; he measured one of the largest, and found it to be 12 yards six inches in girth, and yet found, and 37 yards in the spread of its boughs. At about five or six yards from the ground it was divided into five limbs, each of which was equal to a great tree. What Maundrel hath related was confirmed by a gentleman who was there in the year 1720, with this difference only, viz. in the dimensions of the branches of the largest tree, which he measured, and found to be 22 yards diameter. Now, whether Mr Maundrel meant 37 yards in circumference of the spreading branches, or the diameter of them, cannot be determined by his words; yet either of them well agrees with this last account.

Culture. These plants are propagated by sowing in March on a bed of light earth exposed to the morning sun. The seed must be covered half an inch thick with fine light earth, and the beds watered at times when the weather is dry. In about six weeks the plants will appear; they must at this time be carefully guarded from the birds, shaded from the sun and winds, and kept very clear of weeds. In the latter end of April the following year, they may be removed into beds of fresh earth, placing them at ten inches distance every way. They are to be kept here two years, and such of them as seem to bend must be tied up to a stake to keep them upright. They may afterwards be planted in the places where they are to remain. They thrive well on the sides of barren hills, and make a very pretty figure there.

Uses. From the larch-tree is extracted what erroneously call *Venice turpentine*. This substance, or natural balsam, flows at first without incision; when it has done dropping, the poor people who wait in the fir-woods, make incisions at about two or three feet from the ground, into the trunk of the trees, into which they fix narrow troughs about 20 inches long. The end of these troughs is hollowed like a ladle; and in the middle is a small hole bored for the turpentine to run into the receiver which is placed below it. As the gummy substance runs from the trees, it passes along the sloping gutter or trough to the ladle, and from thence runs thro' the holes into the receiver. The people who gather it visit the trees morning and evening from the end of May to September, to collect the turpentine out of the receivers. When it flows out of the tree, Venice turpentine is clear, like water, and of a yellowish white; but, as it grows older, it thickens, and becomes of a citron colour. It is procured in the greatest abundance in the neighbourhood of Lyons,

Vol. VI.

and in the valley of St Martin, near St Lucern in Switzerland. For the properties and uses of the cedar of Libanus, see the article CEDAR.

LARK, in ornithology. See ALAUDA.

The lark is not only a very agreeable bird for the cage, but a very hardy one. It will live upon almost any food, so that it have once a-week a fresh tuft of three-leaved grass. The *sky* and *wood-lark* differ in the time of their breeding; the former not producing her young ones till May, the latter hatching them in March. In winter, it is common to see vast flocks of sky-larks; and yet it is observed, that there are fewer of their nests found in the season than of any birds that are common among us. The sky-lark sometimes builds among corn, sometimes among high-grass, and seldom has more than three young ones at a brood, scarce ever more than four; so that the origin of the large flocks we see is the more surprising. The young may be taken out of the nest at a fortnight old, and are so hardy that they will be easily brought up. The best food is sheep's heart chopped with egg; and afterwards oatmeal, bruised hempseed, and bread with a little egg among it. They should have clean sand at the bottom of the cage, but they need no perches.

The common way of taking larks is in the night, with those nets which are called *trammels*. These are usually made of 36 yards in length, and about six yards over, with six ribs of pack-thread, which at the ends are put upon two poles of about 16 feet long, and made lesser at each end. These are to be drawn over the ground by two men, and every five or six steps the net is made to touch the ground, otherwise it will pass over the birds without touching them, and they will escape. When they are felt to fly up against the net, it is clapped down, and then all are safe that are under it. The darkest nights are properest for this sport; and the net will not only take larks, but all other birds that roost on the ground; among which are woodcocks, snipes, partridge, quails, field-fares, and several others. In the depth of winter people sometimes take great numbers of larks by nooses of horse-hair. The method is this: Take 100 or 200 yards of packthread; fasten at every six inches a noose made of double horse-hair; at every 20 yards the line is to be pegged down to the ground, and so left ready to take them. The time to use this is when the ground is covered with snow, and the larks are to be allured to it by some white oats scattered all the way among the nooses. They must be taken away as soon as three or four are hung, otherwise the rest will be frightened; but though the others are scared away just where the sportsman comes, they will be feeding at the other end of the line, and the sport may be thus continued for a long time.

LARRIBUNDAR, a sea-port town of Asia, in Indostan; seated at the mouth of the river Sindu, or Indus, with a harbour capable of receiving ships of 200 tons burden. It is but a small place, consisting of about 100 houses built with wood; but has a stone fort, with five great guns, to prevent robberies; because some of the neighbouring countries are much addicted to thieving. E. Long. 67. o. N. Lat. 25. o.

LARUS, the GULL, in ornithology, a genus belonging to the order of anseres, the characters of which are these: The bill is trait, cultrated, a little crooked at the point, and without teeth; the inferior

mandible is gibbous below the apex; the nostrils are linear, a little broader before, and situated in the middle of the back. There are 11 species, principally distinguished by their colour. The most remarkable species are, 1. The marinus, or black-backed gull. The weight of this species is near five pounds; the length 29 inches; the breadth five feet nine. The bill is very strong and thick, and almost four inches long; the colour a pale yellow; but the lower mandible is marked with a red spot, with a black one in the middle. The head, neck, whole under-side, tail, and lower-part of the back, are white: the upper-part of the back, and wings, are black; the quill-feathers tip with white; the legs of a pale flesh-colour. This kind inhabits our coasts in small numbers, and breeds in the highest cliffs. It feeds not only on fish; but, like the raven, very greedily devours carrion. Its egg is very blunt at each end; of a dusky olive colour, quite black at the greater end, and the rest of it thinly marked with dusky spots. On the coast of Anglesea is found a bird that agrees in all respects with this except in size, in wanting the black spot on the bill, and in the colour of the legs, which in this are of a bright yellow: the extent of wings is only four feet five; the length only 22 inches: the weight one pound and a half. This species, or perhaps variety, rambles far from the sea, and has been shot at Bulstrode, in Middlesex.

2. The cataractes, or skua gull. The length of this singular gull is two feet; the extent four feet and a half; the weight three pounds: the bill two inches one-fourth long, very much hooked at the end, and very sharp: the upper mandible covered more than half-way with a black cere or skin, as in the hawk-kind: the nostrils placed near the bend, and are pervious. The feathers on the head, neck, back, scapulars, and coverts of the wings, are of a deep brown, marked with rust-colour (brightest in the male). The breast, belly, and vent, are ferruginous, tinged with ash-colour. The tail when spread is circular, of a deep brown, white at the root, and with shafts of the same colour. The legs are covered with great black scales: the talons black, strong, and crooked; the interior remarkably so.

This bird inhabits Norway, the Ferroe isles, Shetland, and the noted rock Foula, a little west of them. It is also a native of the South Sea. It is the most formidable gull; its prey being not only fish, but, what is wonderful in a web-footed bird, all the lesser sort of water-fowl, such as teal, &c. Mr Schroter, a surgeon in the Ferroe isles, relates that it likewise preys on ducks, poultry, and even young lambs. It has all the fierceness of the eagle in defending its young; when the inhabitants of those islands visit the nest, it attacks them with great force, so that they hold a knife erect over their heads, on which the skua will transfix itself in its fall on the invaders. The Rev. Mr Low, minister of Birsá in Orkney, confirmed part of the above account: On approaching the quarters of these birds, they attacked him and his company with most violent blows; and intimidated a bold dog of Mr Low's in such a manner, as to drive him for protection to his master. The natives are often very rudely treated by them, while they are attending their sheep on the hills; and are obliged to guard their heads by

holding up their sticks, on which the birds often kill themselves. In Foula it is a privileged bird, because it defends the flocks from the eagle, which it beats and pursues with great fury; so that even that rapacious bird seldom ventures near its quarters. The natives of Foula on this account lay a fine on any person who destroys one: they deny that it ever injures their flocks or poultry; but imagine it preys on the dung of the arctic and other larger gulls, which it persecutes till they moor for fear.

3. The parasiticus, or dung-hunter. These birds are very common in the Hebrides. Numbers of them are found in Jura, Ilay, and Rum, where they breed in the heath; if disturbed, they fly about like the lapwing, but soon alight. They are also found in the Orkneys, where they appear in May, and retire in August. It is also found on the coast of Yorkshire, where it is known by the name of *Fesfer*. All writers who mention it agree, that it has the property of pursuing the lesser gulls so long, that they moor for fear, and that it catches up and devours their excrements before they drop into the water; from which the name. Linnæus wittily calls it the *parasite*, alluding to its fordid life.

The length of this species is 21 inches: the bill is dusky, about an inch and a half long, pretty much hooked at the end, but the strait part is covered with a sort of cere. In the male, the crown of the head is black: the back, wings, and tail, dusky; but the lower part of the inner webs of the quill-feathers white: the hind part of the neck, and whole under-side of the body, white: the tail consists of 12 feathers, the two middlemost near four inches longer than the others; the legs black, small, and scaly. The female is entirely brown, but of a much paler colour below than above; the feathers in the middle of the tail are only two inches longer than the others. Linnæus has separated this from its mate, his *larus parasiticus*, and made it a synonyme to his *larus catarractes*, a bird as different from this as any other of the whole genus.

4. The fuscus, or herring-gull, weighs upwards of 30 ounces; the length 23 inches, its breadth 52; the bill yellow, and the lower mandible marked with an orange-coloured spot: the back, and coverts of the wings, ash-coloured; the upper-part of the five first quill-feathers are black, marked with a white spot near their end; the legs of a pale flesh-colour. These birds breed on the ledges of rocks that hang over the sea; they make a large nest of dead grass, and lay three eggs of a dirty white, spotted with black. The young are ash-coloured, spotted with brown. They do not come to their proper colour the first year: this is common to other gulls; which has greatly multiplied the species, among authors, who are inattentive to these particulars. This gull is a great devourer of fish, especially of that from which it takes its name: it is a constant attendant on the nets, and so bold as to seize its prey before the fishermen's faces.

5. The naevius, or wagel. These birds vary much in their size: of those examined by Mr Pennant, one weighed 3 lb. 7 oz. the length was two feet two inches, the breadth five feet six; others again did not weigh two pounds and a half. The irides are dusky; the bill black, and near three inches long. The whole plumage

Larus.

plumage of the head and body, above and below, is a mixture of white, ash-colour, and brown: the last colour occupies the middle of each feather; and in some birds is pale, in others dark: the quill-feathers black: the lower-part of the tail is mottled with black and white: the legs are of a dirty white. Some have supposed this to be the young of the preceding species, which (as well as the rest of the gull tribe) scarce ever attains its true colours till after the first year: but it must be observed, that the first colours of the irides, of the quill-feathers, and of the tail, are in all birds permanent; these differ in each of these gulls so greatly, as ever to preserve unerring notes of distinction. This species is likewise called by some the *dung-hunter*, for the same reason as the last is styled so.

6. The winter-gull weighs from 14 to 17 ounces: the length 18 oz. the breadth three feet nine. The irides are hazel: the bill two inches long, but the slenderest of any gull: it is black at the tip, whitish towards the base. The crown of the head, and hind-part and sides of the neck, are white, marked with oblong dusky spots; the forehead, throat, middle of the breast, belly, and rump, are white; the back and scapulars are of a pale grey, the last spotted with brown; the coverts of the wings are of a pale brown, edged with white; the first quill-feather is black, the succeeding are tipped with white: the tail is white, crossed near the end with a black bar; the legs of a dirty bluish white. This kind frequents, during winter, the moist meadows in the inland parts of England, remote from the sea. The gelatinous substance, known by the name of *star-shot*, or *star-gelly*, owes its origin to this bird, or some of the kind; being nothing but the half-digested remains of earth-worms, which these birds feed on, and often discharge from their stomachs.

7. The canus, or common gull, is the most numerous of the genus. It breeds on the ledges of the cliffs that impend over the sea: in winter they are found in vast flocks on all our shores. They differ a little in size. One examined by Mr Pennant weighed 12 ounces and a half: its length was 17 inches, its breadth 36; the bill yellow; the head, neck, tail, and whole under-side of the body, a pure white; the back, and coverts of the wings, a pale grey; near the end of the greater quill-feathers was a black spot; the legs a dull white, tinged with green.

8. The *rissa*, or kittiwake. The length of this species is 14 inches, the extent three feet two. When arrived at full age, the head, neck, belly, and tail, are of a snowy whiteness; behind each ear is sometimes a dusky spot: the back and wings are grey: the exterior edge of the first quill-feather, and tips of the four or five next, are black; the bill yellow, tinged with green; inside of the mouth orange; legs dusky, with only a knob instead of the back-toe. It inhabits the romantic cliffs of Flamborough-head (where it is called *petrel*), the Bass isle, the vast rocks near the castle of Slains in the county of Aberdeen, and Prieftholm isle. The young of these birds are a favourite dish in North-Britain, being served up roasted, a little before dinner, in order to provoke the appetite; but, from their rank taste and smell, seem much more likely to produce a contrary effect.

9. The *ridibundus*, pewit, or black-head gull. These

birds breed in vast numbers in the islands of certain pools in the county of Stafford; and, as Dr Fuller tells us, in another on the Essex shores; also in the fens of Lincolnshire. They are birds of passage; resort there in the spring, and after the breeding season disperse to the sea-coasts: they make their nest on the ground, with rushes, dead grass, and the like; and lay three eggs of a dirty olive-colour, marked with black. The young were formerly highly esteemed, and numbers were annually taken and fattened for the table. Plott gives a marvellous account of their attachment to the lord of the soil they inhabit; inasmuch that, on his death, they never fail to shift their quarters for a certain time. Whitlock, in his annals, mentions a piece of ground near Portsmouth, which produced to the owner 40 l. a-year by the sale of pewits, or this species of gull. These are the *sea-gulls* that in old times were admitted to the noblemen's tables.

The notes of these gulls distinguish them from any others, being like a hoarse laugh. Their weight is about 10 ounces; their length 15 inches, their breadth 37: their irides are of a bright hazel; the edges of the eye-lids of a fine scarlet; and on each, above and below, is a spot of white feathers. Their bills and legs are of a sanguine red; the heads and throats black or dusky; the neck, and all the under-side of the body, and the tail, a pure white; back and wings ash-coloured; tip and exterior edge of the first quill-feather black, the rest of that feather white, the next to that tipped with black, and marked with the same on the inner web.

LARYNX, in anatomy, the upper-part of the wind-pipe. See ANATOMY, n<sup>o</sup> 380. a.

LASCARIS (Andrew John), surnamed *Ryndacenus*, of an ancient Greek family, went into Italy, after the taking of Constantinople by the Turks, in 1453. He was well received by Laurence de Medicis, a distinguished protector of learned men; and was twice sent to Constantinople to collect the best Greek manuscripts, by which means numberless scarce and valuable treasures of literature were carried into Italy. At his return Lewis XII. king of France prevailed on him to settle in the university of Paris, and sent him twice ambassador to Venice. Ten years after, cardinal John de Medicis being elected pope, under the name of Leo X. John Lascaris, his old friend, went to Rome, and had the direction of a Greek college. He died at Rome in 1535, at about the 90th year of his age. He brought into the West most of the fine Greek manuscripts that are now extant, and composed some epigrams in Greek and Latin.

LASCARIS (Constantine), one of the Greeks who were principally concerned in the revival of learning in the West, retired into Italy in 1454, and taught polite literature at Milan, whither he was called by Francis Sforza; he afterwards went to Rome, where he was well received by Cardinal Bessarion. He afterwards taught rhetoric and the Greek tongue at Naples; and ended his days at Messina, leaving the senate of that city many excellent manuscripts which he had brought from Constantinople. He was interred at the public expence, and the senate of Messina erected a marble tomb to his memory. He wrote some grammatical works.

Larynx,  
Lascaris.

**LASERPITIUM**, **LAZAR-WORT**, a genus of the digynia order, belonging to the pentandria class of plants. There are nine species, none of which are at all remarkable for their beauty, so are only preserved in botanic gardens for the sake of variety. They are natives of Germany, Italy, and the south of France. All of them abound with an acrid juice, which turns to an excessively acrimonious resin. This was used by the ancients to take away black and blue spots that came by bruises or blows, as also to take away excrescences: it was also by some of the ancients used internally; but produced such violent effects, that the more prudent refrained from the use of it. It is generally supposed that the silphium of the ancients was procured from one of the species of this genus; but of this we are at present ignorant.

**LASH**, or **LACE**, in the sea-language, signifies to bind and make fast; as, to lash the bonnet to the course, or the drabber to the bonnets: also the carpenter takes care that the spare yards be lashed fast to the ship's side; and in a rolling sea, the gunners mind that the guns be well lashed, lest they should break loose. **Lashers** are properly those ropes which bind fast the tackles and the breechings of the ordnance, when hauled or made fast within-board.

**LASSITUDE**, or **WEARINESS**, in medicine, a morbid sensation, that comes on spontaneously, without any previous motion, exercise, or labour. This is a frequent symptom in acute distempers: it arises either from an increase of bulk, a diminution of proper evacuation, or too great a consumption of the fluids necessary to maintain the spring of the solids, or from a vitiated secretion of that juice.

**LAST**, in general, signifies the burden or load of a ship. It signifies also a certain measure of fish, corn, wool, leather, &c. A last of codfish, white herrings, meal, and ashes for soap, is twelve barrels; of corn or rapeseed, ten quarters; of gun-powder, twenty-four barrels; of red-herrings, twenty cades; of hides, twelve dozen; of leather, twenty dickers; of pitch and tar, fourteen barrels; of wool, twelve sacks; of stock-fish, one thousand; of flax or feathers, 1700 lb.

**LASTAGE**, or **LESTAGE**, a duty exacted in some fairs and markets, for carrying things bought whither one will. It signifies also the ballast or lading of a ship; and sometimes is used for garbage, rubbish, or such like filth.

**LATERAN COUNCILS**, those councils held in the basilica of the Latin church at Rome. See **COUNCIL**.

There have been five councils held in this place, viz. in the years 1123, 1139, 1179, 1215, and 1513.

**Canon regular of the Congregation of the LATERAN**, were introduced in the reign of Pope Leo I. and continued in the church till the reign of Boniface, who displaced them, and put secular canons in their room; but 150 years after, the regulars were re-instated again.

A **LATERE**, a term used to denote the qualifications of the cardinals whom the pope sends as legates into foreign countries. They are called *legates a-latere*, as being his holiness's assistants and counsellors in ordinary. There are the most considerable of the other three kinds of legates, being such as the pope commissions to take his place in councils; and so called, in regard that he never gives this office to any but his

favourites and confidants, who are always *a-latere*, at his side. A legate *a-latere* has the power of conferring benefices without a mandate, of legitimating bastards to hold offices, and has a cross carried before him as the ensign of his authority.

**De LATERE**, legates who are not cardinals, but yet are intrusted with an apostolical legation. See the article **LEGATE**.

**LATE-WAKE**, a ceremony used at funerals in the Highlands of Scotland. The evening after the death of any person, the relations and friends of the deceased meet at the house, attended by bagpipe or fiddle; the nearest of kin, be it wife, son, or daughter, opens a melancholy ball, dancing, and *greeting* (i.e. crying violently) at the same time, and this continues till day-light; but with such gambols and frolics among the younger part of the company, that the loss which occasioned them is often more than supplied by the consequences of that night. If the corpse remains unburied for two nights, the same rites are renewed. Thus, Scythian-like, they rejoice at the deliverance of their friends out of this life of misery.

**LATEEN-SAIL**, a long triangular sail extended by a lateen yard, and frequently used by xebecs, polacres, settees, and other vessels navigated in the Mediterranean sea.

**LATH**, in building, a long, thin, and narrow slip of wood nailed to the rafters of a roof or ceiling, in order to sustain the covering.

**LATH-Bricks**, a particular sort of bricks made in some parts of England, of 22 inches in length and 6 in breadth, which are used in the place of laths or spars, supported by pillars in cafts, for the drying of malt. This is an excellent contrivance; for besides that they are not liable to fire, as the wooden laths are, they retain the heat vastly better; so that being once heated, a very small quantity of fire will serve to keep them so.

**LATHE**, a very useful engine for the turning of wood, ivory, metals, and other materials. See **TURNING**. The invention of the lathe is very ancient: Diodorus Siculus says, the first who used it was a grandson of Dædalus, named Talus. Pliny ascribes it to Theodorus of Samos; and mentions one Thiericles, who rendered himself very famous by his dexterity in managing the lathe. With this instrument the ancients turned all kinds of vases, many whereof they enriched with figures and ornaments in basso relievo. Thus Virgil:

*Lenta quibus torno facili superaddita vitis.*

The Greek and Latin authors make frequent mention of the lathe; and Cicero calls the workmen who used it *vascularii*. It was a proverb among the ancients, to say a thing was formed in the lathe, to express its delicacy and justness.

The lathe is composed of two wooden cheeks, or sides, parallel to the horizon, having a groove or opening between; perpendicular to these are two other pieces, called *pappets*, made to slide between the cheeks, and to be fixed down at any point at pleasure. These have two points, between which the piece to be turned is sustained; the piece is turned round, backwards and forwards, by means of a string put round it, and fastened above to the end of a pliable pole, and underneath to a trestle or board moved with the

**Lathyrus**, the foot. There is also a rest which bears up the tool, and keeps it steady.

**Latimer**. As it is the use and application of this instrument that makes the greatest part of the art of turning, we refer the particular description thereof, as well as the manner of applying it in various works, to that head. See **TURNING**.

**LATHYRUS**, **CHICKLING-VETCH**, a genus of the diadelphia order, belonging to the decandria class of plants.

*Species*. 1. The latifolius, or everlasting pea, hath thick, fibrous, perennial roots; climbing, thick, branching annual stalks, having membranaceous wings between the joints, rising upon support by their cirri fix or eight feet high; diphyllous leaves, of two spear-shaped lobes, terminated by clasps; and numerous large red or purple flowers on long foot-stalks, appearing plentifully from June till October, succeeded by abundance of seed. 2. The odorata, or sweet-scented pea, hath a fibrous annual root; a climbing stalk, rising upon support by its clasps three or four feet high; diphyllous leaves of two oval lobes, terminated by climbing tendrils; and flowers by two's on long flower-stalks, of different colours in the varieties. 3. The tangitanus, or Tangier-pea, hath a fibrous annual root, a climbing stalk rising upon support for four or five feet high; diphyllous leaves, of two spear-shaped alternate lobes, terminated by tendrils; and from the joints of the stalk large reddish flowers by two's on long footstalks.

*Culture*. All these species are of hardy growth; and may be propagated by seed in the common ground, in patches where it is designed the plants should flower, for they do not succeed so well by transplantation. They may be sowed in spring; though, if sowed in autumn, the plants will flower earlier the following year.

**LATIMER** (Hugh), bishop of Worcester, was born about the year 1480, at Thurstaston in Leicestershire, the only son of a yeoman of that village. At the age of fourteen he was sent to Christ's college, Cambridge; where he applied himself to the study of divinity, and in proper time took the degree of bachelor in that science. At this time he was a zealous Papist, and was honoured with the office of keeper of the cross to the university: but when he was about thirty years of age, he became a convert to the Protestant religion; and being now one of the twelve licensed preachers from Cambridge, he promulgated his opinions with great freedom. It was not long before he was accused of heresy; and being summoned before cardinal Wolsey, was obliged to subscribe certain articles of faith, which he certainly did not believe. About the year 1529, he was presented by the king to the rectory of Westkinton in Wiltshire; to which place, after residing some time at court with his friend and patron Dr Butts, he retired; but, refusing his former invectives against the Popish doctrines, he was again summoned to answer certain interrogatories, and again obliged to subscribe. In 1535 he was promoted to the bishoprick of Worcester; in the possession of which dignity he continued till the year 1539, when, rather than assent to the act of the six articles, he resigned his mitre, and retired into the country; but was in a short time accused of speaking against the six

articles, and committed to the tower, where he continued prisoner till the death of Henry VIII. which happened in January 1547.

On the accession of Edward VI. Latimer was released, but not restored to his bishoprick, though he preached several times before the king, and continued to exercise his ministerial function with unremitting zeal and resolution. Young Edward, alas! finished his short reign in 1553; and Mary, of infamous memory, ascending the throne, poor Latimer was immediately doomed to destruction, and, together with Cranmer and Ridley, confined in the tower. In April 1554, they were removed to Oxford, that they might dispute with the learned doctors of both universities. Latimer declining the disputation on account of his great age and infirmities, delivered his opinion in writing; and refusing to subscribe the Popish creed, was condemned for heresy; and in October following was, together with bishop Ridley, burnt alive. He behaved with uncommon fortitude on the occasion, and died a real martyr to the Reformation. His general character is that of a learned, virtuous, and brave man.

His works are, 1. Sermons, 1635, fol. 2. Letters; in Fox's Acts and Monum. vol. ii. fol. 1580. 3. An injunction to the prior and convent of St Mary's in Worcester-shire. See record at the end of Burnet's History of the Reformation, part. ii. p. 293.

**LATIN**, a dead language, first spoken in Latium, and afterwards at Rome; and still used in the Romish church, and among many of the learned.

This language is principally derived from the Greek, and particularly from the Eolic dialect of that tongue, though it has a great number of words which it borrowed from the languages of the Etrusci, Osci, and other ancient people of Italy; and foreign commerce and wars, in course of time, added a great many more.

The Latin is a strong, nervous language, perfectly suitable to the character of the people who spoke it: we have still works of every kind admirably well written in the Latin, though there are vast numbers lost.

The Latin tongue was for a while confined almost wholly within the walls of Rome; nor would the Romans allow the common use of it to their neighbours, or to the nations they subdued: but by degrees they in time became sensible of the necessity of its being generally understood for the convenience of commerce; and accordingly used their endeavours, that all the nations subject to their empire should be united by one common language; so that at length they imposed the use of it by a particular law for that purpose. After the translation of the seat of the empire from Rome to Constantinople, the emperors of the east, being always desirous of retaining the title of Roman emperors, appointed the Latin to be still used; but at length neglecting the empire of the west, they abandoned all care of the Latin tongue, and used the Greek. Charlemagne coming to the empire of the west, revived this language; but at length it gave way, and the French took place of the Latin: it was, however, prodigiously degenerated before it came to be laid aside, in which condition it was found at the time of the Reformation, when Vives, Erasmus, &c. began to open the way for its recovery: since which time the monkish latinity has been

Latin been declining, and all endeavours have been used to retrieve the pure language of the Augustan age. See LANGUAGE. Latten.

*LATIN Church.* See CHURCH.

**LATINS**, an ancient nation of Italy. See LATIUM.

**LATINUS**, king of the Latins in Italy, was the son of Faunus; and, it is said, began to reign about the 1216th year before the Christian æra. Lavinia, his only daughter, married Æneas, after that Trojan prince had killed Turnus king of the Rutuli. See ROME.

**LATIUM**, (anc. geogr.), the country of the Latins, at first contained within very narrow bounds, but afterwards increased by the accession of various people. The appellation, according to Virgil, is a *latendo*, from Saturn's lying hid there from the hostile pursuits of his son Jupiter; and from *Latium* comes the name *Latini*, the people, (Virgil): though Dionysius Halicarnassensis derives it from king Latinus, who reigned about the time of the Trojan war. But whatever be in this, it is certain, that *Latium*, when under Æneas and his descendants, or the Alban kings, contained only the Latins, exclusive of the *Æqui*, *Volsci*, *Hernici*, and other people; only that Æneas reckoned the Rutuli, after their conquest, among the Latins. And this constituted the ancient *Latium*, confined to the Latins: but afterwards, under the kings, and after their time, it reached from the Tiber to Circeii. Under the consuls, the country of the *Æqui*, *Volsci*, *Hernici*, &c. after long and bloody wars, was added to *Latium*, under the appellation *adjecititious*, or *super-added Latium*, as far as the river Liris, the eastern boundary, and to the north as far as the Marſi and Sabines. The various people, which in succession occupied *Latium*, were the Aborigines, the Pelasgi, the Arcades, the Siculi, the Arunci, the Rutuli; and beyond Circeii, the Volsci, the Osci, the Ausones: but who first, who next, occupied the country, is difficult to say.

**LATISSIMUS**, in anatomy. See ANATOMY, *Table of the muscles.*

**LATITUDE**, in astronomy, is the distance of a star north or south from the ecliptic. In geography, it signifies the distance of any place north or south from the equator. See ASTRONOMY, n° 209, 214. and GEOGRAPHY, n° 11.

**LATITUDINARIAN**, a person of moderation with regard to religious opinions, who believes there is a latitude in the road to heaven, which may admit people of different persuasions,

**LATOMIA**, properly signifies a *quarry*, or place whence stones are dug. The word comes from the Greek *λατ*, *stone*, and *τομια*, *I cut*. These were anciently used as gaols for criminals.—Dionysius had a place of this kind dug in a rock near Syracuse, where an infinite number of people were shut up. Cicero reproaches Verres with imprisoning Roman Citizens in *Latomia*; so that *latomia* became a general name for a prison, and the prisoners inclosed in them were called *latomarii*.

**LATRIA**, in theology, a religious worship due only to God. See ADORATION.

The Romanists say, 'They honour God with the worship of *latria*; and the saints with the worship of

*dulia*.' But the terms, however distinct, are usually confounded.

The worship of *latria*, besides its inner characters, has its external marks to distinguish it; the principal whereof is sacrifice, which cannot be offered to any other but God himself, as being a solemn acknowledgement or recognition of the sovereignty of God, and our dependence on him.

Mr Daille seems to own, that some of the fathers of the fourth century allowed the distinction between *latria* and *dulia*.

**LATTEN** denotes iron-plates tinned over, of which tea-canisters are made.

Plates of iron being prepared of a proper thinness, are smoothed by rusting them in an acid liquor, as common water made eager with rye. With this liquor they fill certain troughs, and then put in the plates, which they turn once or twice a day, that they may be equally rusted over. After this they are taken out, and well scoured with sand; and, to prevent their rusting again, are immediately plunged into pure water, in which they are to be left till the instant they are to be tinned or blanchied; the manner of doing which is this: They flux the tin in a large iron-crucible, which has the figure of an oblong pyramid with four faces, of which two opposite ones are less than the two others. The crucible is heated only from below, its upper part being luted with the furnace all round. The crucible is always deeper than the plates, which are to be tinned, are long; they always put them in downright, and the tin ought to swim over them; to this purpose artificers of different trades prepare plates of different shapes, though Mr Reaumur thinks them all exceptionable. But the Germans use no sort of preparation of the iron to make it receive the tin, more than the keeping it always steeped in water till the time; only, when the tin is melted in the crucible, they cover it with a layer of a sort of suet, which is usually two inches thick, and the plate must pass through this before it can come to the melted tin. The first use of this covering is to keep the tin from burning; for if any part should take fire, the suet would soon moisten it, and reduce it to its primitive state again. The blanchers say, this suet is a compounded matter. It is indeed of a black colour; but Mr Reaumur supposed that to be only an artifice to make it a secret, and that it is only coloured with soot or the smoke of a chimney: but he found it true so far, that the common unprepared suet was not sufficient; for after several attempts, there was always something wanting to render the success of the operation certain. The whole secret of blanching, therefore, was found to lie in the preparation of this suet; and this at length he discovered to consist only in the first frying and burning it. This simple operation not only gives it the colour, but puts it into a condition to give the iron a disposition to be tinned, which it does surprisingly.

The melted tin must also have a certain degree of heat: for if it is not hot enough, it will not stick to the iron; and if it is too hot, it will cover it with too thin a coat, and the plates will have several colours, as red, blue, and purple, and upon the whole will have a cast of yellow. To prevent this, by knowing when the fire has a proper degree of heat, they might try with small pieces of iron; but in general, use teaches them

Latten,  
Lava.

to know the degree, and they put in the iron when the tin is at a different standard of heat, according as they would give it a thicker or thinner coat. Sometimes also they give the plates a double layer, as they would have them very thickly covered. This they do by dipping them into the tin when very hot the first time, and when less hot the second. The tin which is to give the second coat, must be fresh covered with fuel; and that with the common fuel, not the prepared.

**LATTEN-BRASS**, plates of milled brass, reduced to different thicknesses, according to the uses it is intended for.

**LAVA**, a stream of melted minerals which runs out of the mouths, or bursts out through the sides, of burning mountains during the time of an eruption. See ICELAND, n° 2, &c. **ÆTNA**, **VESUVIUS**, **VOLCANO**, &c.

The lava, at its first discharge, is in a state of prodigious ignition, greatly superior to anything we can have an idea of from the small artificial furnaces made by us. Sir William Hamilton informs us, that the lava of Vesuvius, at the place from whence it issued (in the year 1767), "had the appearance of a river of red-hot and liquid metal, such as we see in the glass-houses, on which were large floating cinders half lighted, and rolling over one another, with great precipitation, down the side of the mountain, forming on the whole a most beautiful and uncommon cascade." Now, if we consider the materials of which the lava consists, which undoubtedly are the common matters to be found every where in the earth, namely, stones, metallic ores, clay, sand, &c. we shall find that our hottest furnaces would by no means be able to bring them into any degree of fusion; since the materials for glass cannot be melted without a great quantity of very fusible salts, such as alkalies, nitre, &c. mixed along with them. The heat of a volcano must therefore be immense: and besides its heat, it is sometimes attended with a very uncommon circumstance; for Sir William Hamilton informs us, that "the red-hot stones thrown up by Vesuvius on the 31st of March 1766, were perfectly transparent." This we cannot look upon to be the mere effect of heat: for mere heat with us will not make a solid body transparent; and these stones we are sure were not in a state of fusion, or the resistance of the air would have broke them all to pieces, even supposing them, which is very improbable, to have been in that state detached from the rest of the lava. For the transparency, therefore, we must have recourse to electricity, which in some of our experiments hath the property of rendering opaque bodies transparent\*. Indeed it is scarce possible but the lava and every other matter thrown out of a volcano must be in the highest degree electrical; seeing the fire itself most probably takes its rise from electricity, as is shown under the article **VOLCANO**.

The lava, after having once broke out, does not constantly continue running from the same vent, but often hath intermissions, after which it will burst out sometimes at the same place, and sometimes at another. No real flame ever appears to come from the lava. In the day-time its progress is marked by a thick white smoke, from which the light of the red-hot matter being reflected in the night-time, makes it appear

like flame. But if, during its progress, the lava meets with trees or other combustible substances, which it frequently does, a bright flame immediately issues from its surface, as hath also been remarked by Sir William Hamilton.—This liquid substance, after having run pure for about 100 yards, (more or less, no doubt, according to different circumstances), begins to collect cinders, stones, and a scum is formed on the surface. Our author informs us, that the lava which he observed, with its scum, had the appearance of the river Thames, as he had seen it, after a hard frost and a great fall of snow, when beginning to thaw, carrying down vast masses of snow and ice. In some places it totally disappeared, and ran in a subterraneous passage formed by the scum for several paces; after which it came out pure, having left the scum behind, though a new one was quickly formed. This lava at the farthest extremity from its source did not appear liquid, but like a heap of red-hot coals, forming a wall in some places 10 or 12 feet high, which rolling from the top soon formed another wall, and so on.—While a lava is in this state, Sir William is of opinion, that it is very practicable to divert it into another channel, in a manner somewhat similar to what is practised with rivers. This he was afterwards told had been done with success during the great eruption of Ætna in 1669: that the lava was directing its course towards the walls of Catania, and advancing very slowly, when they prepared a channel for it round the walls of the town, and turned it into the sea. A succession of men, covered with sheep-skins wetted, were employed to cut through the tough flanks of lava, till they made a passage for that in the centre, which was in perfect fusion, to disgorge itself into the channel prepared for it. It hath been also observed of the lavas of Ætna, that they do not constantly fall down to the lowest places, but will sometimes ascend in such a manner as to make the valleys rise into hills. On this Sir William Hamilton has the following note: "Having heard the same remark with regard to the lavas of Vesuvius, I determined, during an eruption of that volcano, to watch the progress of a current of lava, and I was soon enabled to comprehend this seeming phenomenon; though it is, I fear, very difficult to explain. Certain it is, that the lavas, while in their most fluid state, follow always the laws of other fluids; but, when at a great distance from their source, and consequently encumbered with scorizæ and cinders, the air likewise having rendered their outward coat tough, they will sometimes (as I have seen) be forced up a small ascent, the fresh matter pushing forward that which went before it, and the exterior parts of the lava acting always as conductors (or pipes, if I may be allowed the expression) for the interior parts, that have retained their fluidity from not being exposed to the air."

The composition of the lavas of different volcanoes, and even of different parts of those of the same volcano, is extremely different. Sir William Hamilton is of opinion that this difference in composition contributes not a little to the facility or difficulty with which they afterwards receive earth capable of vegetation. "Some W. Hamilton (says he) have been in a more perfect state of vitrification than others, and are consequently less liable to the impressions of time. I have often observed on

Lava.

Do not always descend to the lowest places.

Excessive heat of lava.

\* See Electricity, n° 481.

Probably in a highly electrical state also.

Their general appearance.

LAVA.

mount Vesuvius, when I have been close to a mouth from whence the lava was disgorging itself, that the quality of it varied greatly from time to time. I have seen it as fluid and coherent as glass when in fusion; and I have seen it farinaceous, the particles separating as they forced their way out, just like meal coming from under the grindstones. A stream of lava of this sort being less compact, and containing more earthy particles, would certainly be much sooner fit for vegetation, than one composed of the more perfect vitrified matter."—No person, however, hath yet accurately analysed any lava; neither is it an easy task to do so. Mr Bergman hath indeed made some observations upon the Icelandic lavas, which throw a good deal of light upon this subject. One kind of this lava, he tells us, is very coarse, heavy, and hard, full of bladders, almost black, intermixed with white grains resembling quartz, which in some places have a figure not very unlike a square. This black matter is not attracted by the magnet; but if a piece of it is held against a compass, the needle visibly moves. When tried in the crucible, it yields from 10 to 12 pounds of iron in every hundred weight. It does not dissolve in the least with sal sodæ, and very difficultly with borax, and hardly visible with urinous salt. It seems to contain a great deal of clay in its composition, which may be extracted by all acid solvents. This last he is likewise, from experiments, assured is the case with the lava of Solfaterra in Italy.

By Mr Bergman.

The white lava, which possesses more or less of those transparent grains or rays with which lavas are generally chequered, does not seem to be of the nature of quartz, as it cannot be attacked by sal sodæ; it is, however, soluble with some difficulty by borax and fusible urinous salt, or microcosmic acid. These effects are perfectly similar to those produced upon the diamond, ruby, sapphire, topaz, and hyacinth. The chrysolite, garnet, tourmalin, and shirl, can neither be dissolved by sal sodæ, though they are somewhat attacked by it when reduced to a fine powder; and upon the two last-mentioned ones it produces a slight effervescence; on which account, says Mr Bergman, it is possible that the precious stones found upon mount Vesuvius, which are sold at Naples, are nearer related to the real precious stones than is generally imagined. He found no such grains in a finer kind of lava, quite porous within, and entirely burnt out, and considerably lighter than the former ones.

The Iceland agate is of a black or blackish-brown colour, a little transparent at the thin edges like glass, and gives fire with steel. It cannot easily be melted by itself; but becomes white, and flies in pieces. It can hardly be dissolved in the fire by fusible urinous salt; but it succeeds a little better with borax, though with some difficulty. With sal sodæ it dissolves very little; though in the first moments some ebullition is perceived, and the whole mass is afterwards reduced to powder. Hence Mr Bergman concludes, that this agate hath been produced by an excessive fire out of the black lava formerly mentioned.

In the Iceland pumice-stone, quartz and crystals are often found, particularly in the black and reddish-brown kind. The stones thrown out of the volcano, whether grey, or burnt brown, seemed to consist of a hardened clay, mixed with a siliceous earth. They

were sprinkled with rays and grains resembling quartz, and some few flakes of mica. They fused with great difficulty in the fire; with sal sodæ they shewed some effervescence at first, but which ceased in a short time. The parts resembling quartz produced no motion at all; from whence Mr Bergman concludes, that the black lava already mentioned proceeds principally from this mass. Several other stones which were sent him from Iceland, Mr Bergman supposed to have no connection with the eruptions, but to have been produced in some other way.

In Mr Ferber's travels through Italy, we are informed, that he has seen a species of lava so exactly resembling blue iron slags, that it was not to be distinguished from them but with great difficulty. The same author tells us likewise, that "the Vicentine and Veronese lavas and volcanic ashes contain inclosed several sorts of fire-striking and flint-horn stones, of a red, black, white, green, and variegated colour, such as jaspers and agates; that hyacinths, crysolites, and *pietre obsidiane*, described by Mr Arduini in his *Giornale d'Italia*, are found at Leonedo; and that chalcodony, or opal, pebbles, and noduli with inclosed water-drops, (*chalcodoni spalti enhydri*), are dug out of the volcanic cineritious hills near Vicenza. One might consider these flints as being torn and dragged from the scaglia, and thence to have been by floods heaped together with ashes and lavas; because it is a fact, that innumerable quantities of flints, jaspers, and agates, are found in the china and potters clay-hills near *S. Ulderico nel Tretto*, (exactly as similar flints are found in the Saxonian and other china clays.) But how did they come into these volcanic hills, which like those of St Rocco near *S. Ulderico*, never contain any clay whatever? Supposing their having been by subterraneous fire separated from veins pre-existing in or near the very bottom of the ancient volcanoes; this explains pretty well how they came into their lava and the china clay, when in an aqueous dissolution or mixture it was vomited, since fragments of quartz-crystallization, marble, and other pre-existing stones, are likewise found in these argillaceous beds, &c.—All these circumstances agree in support of Mr Arduini's assertion, that the beforementioned flint-horn stones found among volcanic materials are owing to subterraneous fire and its meltings. Knowing that by vitrescent compositions and chemical fire even the hardest precious stones can be nearly imitated, why should we deny the same power to nature and its greater subterraneous furnaces?"

On this passage Mr Raspe has the following note. <sup>9</sup> Mr Raspe's criticism of Mr Ferber's  
"To prevent mistakes, and the charge of inaccurate writing or reasoning, the author should have explained himself with more propriety, and with more justice to nature, and perhaps to Mr Arduini. Therefore the translator, who has examined several volcanoes, and studied nature in her own manufactories or offices, endeavours to set him right. His observations are so far agreeing with Messrs Ferber's and Arduini's, that he considers the chalcodony as volcanic productions, but in a quite different sense from that in which the ashes and lavas, with their various inclosed sherry-crystallizations, chrysolite or hyacinth-like vitrifications, and *pietre obsidiane*, are called so. These are undoubtedly immediate productions of the fire, and violent

LAVA.

By Mr Ferber.

violent melting; the former being but *parafitical ftones* of volcanic matrices; that is to say, but *mediate productions* of the fire, as being wifely produced by water, either foaking through and into the holes of volcanic ftones, and depofiting therein the flint-like fire-ftriking fediiment of chalcedony; or, if properly qualified and heated by natural fire or fermentation, precipitating the fame under other circumftances. The former appears to conviction by the Vicentine and Iceland chalcedonies; the latter by a fingular phenomenon, which I fhall take notice of. The Vicentine chalcedonies found in volcanic tufo, contain now and then, inclofed in their middle, drops of the water which produced them; and the Iceland-chalcedonies bear likewife undoubted marks of an aqueous origin. The tranflator knows, by good authority, that they have been difcovered but of late; and ocular infpection has convinced him, not only that thefe Iceland-chalcedonies are equal in grain and colour to the Oriental ones, but remarkably fuperior to them on account of their bignefs. He had large pieces fent him from Copenhagen above a foot fquare; and what is more to the fubject, inclofed in a brownifh tufo, in which they appeared to have been ftratified, or fucceffively depofited by water; confifting more or lefs of white transparent beds, about an inch thick, and ficking as clofe together as the fimilar ftrata of the coloured agates or onyx. Mr Banks's late voyage to Iceland brings us ftill a ftep further. He examined there the marvelous intermittent fpouting hot wells, called the *Geysers*, at Laugafell, which in the middle of a folfatara, or ancient volcano, by their accumulated fediiments have produced or raifed a wide floping hill of white lebes or pot-ftone. I forbear to draw from this fingular phenomenon the many confequences which it offers for natural hiftory; obferving only what is more to the purpofe, that in fome harder pieces of white lebes, kept in Mr Banks's Iceland collection, there appears a ftratified white chalcedony which cannot be confidered as adventitious; and undoubtedly is produced either by a finer fediiment, or by its greater faturatation; proving, that the fubftantial earth of chalcedony and lebes are the fame, and that both are nearly related to the lapis nephriticus, the ferpentine, the bacon-ftone, the amianth, and the talc, which are found in many volcanic places; and, according to Mr Marggraf's experiments, have been by many mineralogifts wrongly placed among the argillaceous ftones. Similar operations of properly qualified hot wells, fo common and various in volcanic countries, might very well anfwer for the jafpers, agates, and other flints in the china clays and boles. But whether they have in fact produced them, muft be left to future proper inquiries in the volcanic countries where they are fo very common."

9  
Bafaltes  
fuppofed to  
be a fpecies  
of lava.

The fame author is alfo of opinion, that the bafaltes itfelf, or thofe pillars of which the Giants Caufeway in Ireland and the ifland of Staffa in the Hebrides confift, is no other than a fpecies of lava, which has taken upon itfelf thefe regular figures during the time of its cooling, as Glauber fays and fome others likewife take upon them a kind of columnar figure during the time of their cryftallization. Of this cryftallization of lavas Mr Ferber tells us he had an inftance in the black kind formerly mentioned. At the time he went from Rome to Oſia, they were paving the road with this fort of

VOL. VI.

lava. In fome of the broken pieces he obferved little empty holes of the bignefs of a walnut, incruftated all around their inner fides by white or amethyftine femipellucid, pointed, or truncated pyramidal cryftallizations, entirely refembling the agate nodules or geodes, which commonly are filled with quartz-cryftallizations. There was no crack or fiffure in the ambient compact lava; the cryftal fhells were pretty hard, and might rather be called *quartz*. In the reft of the holes was fome fine brownifh duft, impalpable and light as afhes. In another place alfo, he tells us, that in the greateft part of the Vicentine, Veronefe, and Paduan lavas, is to be found an infinite quantity of white polygonal fhell-cryftallizations, whole figure is as regular, and ftill more polygonal than the bafaltes; and can only be fuppofed to have been formed in the lava while in a fluid ftate. It is indeed very improbable that fuch fubftances fhould be thrown up along with the lava unchanged, feeing the intense heat muft have been fufficient to melt the molt refractory fubftance we can imagine, and we have no evidence of fuch numbers of thefe fubftances exifting at the bottoms of the burning mountains. Still, however, neither Mr Ferber, nor Mr Rafpe, nor any other advocate for the volcanic origin of bafaltes, hath been able to find a bafaltic column either in the lavas of Vefuvius, *Ætna*, or the Iceland volcanoes; fo that this fact muft be in fome meafure dubious, though the analogical reasoning fhould be ever fo ftrong. Mr Rafpe indeed attempts to folve this difficulty by another. "The queftion, (fays he), Why do not all lavas crytallize into prifmatical bafalts, or why do not the Vefuvian lavas fhew that form? is the fame as afking, Why does not every quartz appear in crytallizations?" But the infufficiency of fuch answers is evident.—On the production of bafaltes, &c. from the lava of volcanoes, Mr Bergman gives his opinion in the following words.

"As it is not uncommon, even in the profeflors of Mr Berg's morality, to pafs from one wrong ftep to another, fo man's opinion are we not without examples of this kind in thofe who make nature their ftudy. Ten years ago it was a general opinion that the furface of the earth, together with the mountains upon it, had been produced by moiſture. It is true, fome declared the fire to be the firft original caufe; but the greater number paid little attention to this opinion. Now, on the contrary, that a fubterraneous fire had been the principal agent, gains ground daily: every thing is fuppofed to have been melted, even to the granite. My own opinion with regard to it is this, That both the fire and water have contributed their fhare in this operation, though in fuch a proportion, that the force of the former extends much further than the latter; and, on the contrary, that the fire has only worked in fome parts of the furface of the earth.

"Of all the mountains hitherto known, there are without doubt none more remarkable than thofe that are compofed of angular pillars. A few years ago only one or two of this kind were known; but new ones are daily difcovered; which is a plain proof how much our attention requires being rouzed, to prevent it from flumbering, even on the moft important occafions.

"It cannot much be doubted, that there has been fome connection between thefe pillars and the effects

of subterranean fire, as they are found in places where the signs of fire are yet visible, and as they are even found mixed with lava, tophus, and other substances produced by fire.

"The cause of the regular form of these pillars is a problem which we have hitherto been unable to solve satisfactorily. This difficulty has appeared so insurmountable to some, that they have thought it impossible for them to be the effects of nature, and have considered them as works made by human hands: this idea betrays the utmost ignorance in regard to the true nature of these mountains of pillars, and does not even deserve a refutation.

"As far as we know, nature makes use of three methods to produce regular forms in the mineral kingdom: 1. That of crystallization, or precipitation; 2. The crusting or settling of the external surface of a liquid mass whilst it is cooling; and, 3. The bursting of a moist substance while it is drying.

"The first method is the most common; but, to all appearance, nature has not made use of this in the present case. Crystals are seldom or never found in any considerable quantity running in the same direction, but either inclining from one another, or, what is still more common, placed towards one another, in sloping directions. They are also generally separated a little from one another when they are regular; the nature of the thing requires this, because the several particles of which the crystals are composed must have the liberty of following that power which affects their regular disposition.

"The basaltic columns, on the contrary, whose height is frequently from 30 to 40 feet, are placed parallel to one another in considerable numbers, and so close together, that the point of a knife can hardly be introduced between them. Besides, in most places, each pillar is divided into several parts or joints, which seem to be placed upon one another: and indeed, it is not uncommon for crystals to be formed above one another in different layers, when the solvent has been visibly diminished at different times; but then the upper crystals never fit so exactly upon the lower ones as to produce connected prisms of the same length and depth as all the strata taken together; but each stratum separately taken, forms its own crystals.

"How then can the Giant's Causeway in the county of Antrim, Fingal's Cave at Staffa, and all other assemblages of pillars of the same kind, be considered as crystallizations! Precipitation, both in the wet and dry manner, requires that the particles should be free enough to fix themselves in a certain order; and as this is not practicable in a large melted mass, no crystallizations appear in it, except on its surface or in its cavities.

"Add to this, that the basalts in a fresh fracture do not shew a plain smooth surface under the microscope; but appear sometimes like grains of different magnitude, and at other times resemble fine rays running in different directions, which does not correspond with the internal structure of the crystals.

"From what I have hitherto mentioned, the opinion that the basalts have been produced by crystallization becomes at least less probable, whether we admit the wet or the dry method. But I must not omit, that the spars exhibit a kind of crystallization,

which at first sight resembles a heap of basalts; but, upon a closer examination, a very great difference is observed. The form of the spar is every-where alike, but the basalts differ from one another in point of size and number of sides: the former when broken consists of many small unequal cubes, but the basalt does not separate in regular parts, &c. &c.

"Nature's second method to produce regular forms is that of crusting the outer-surface of a melted mass. By a sudden refrigeration, nature, to effect this purpose, makes use of polyhedrous and irregular forms. If we suppose a considerable bed which is become fluid by fire, and spread over a plain, it evidently appears that the surface must first of all lose the degree of heat requisite for melting, and begin to congeal; but the cold requisite for this purpose, likewise contracts the uppermost congealed stratum into a narrower space, and consequently causes it to separate from the remaining liquid mass, as the side exposed to the air is already too stiff to give way. In this manner a stratum is produced running in a parallel direction with the whole mass; others still are produced by the same cause, in proportion as the refrigeration penetrates deeper.

"Hence we may, in my opinion, very plainly see how a bed may be divided into strata. In the same manner the refrigeration advances on the sides, which consequently divides the strata into polyhedrous pillars, which can hardly ever be exactly square, as the strongest refrigeration into the inner-parts of the mass advances almost in a diagonal line from the corners. If we add to this, that a large mass cannot be equal through its composition, nor every-where liquid in the same degree; it will be easy to discover the cause of several irregularities. If the depth of the bed is very considerable in proportion to its breadth, prismatic pillars, without cross divisions, are produced, at least lengthways, from the uppermost surface downwards.

"The third way is perfectly similar to the preceding in respect to the effect; but is different from it by the mass being soaked with water, and by the bursting of it asunder, being the effect of the contraction whilst it is drying. If we suppose such a bed to be spread over a level space, the drying advances in the same manner as the refrigeration in the former case.

"This separation into strata properly happens when a considerable quantity of clay enters into the whole composition, because the clay decreases more than any other kind of earth in drying."

Our author now proceeds to consider the manner in which he thinks the basaltes most probably may be produced; and having rejected the hypothesis of those who derive them from a crystallization of melted lava, he gives his own opinion as follows. "It seems more credible to me, that they have been produced out of their substance whilst it was yet soft, or at least not too hard to be softened by exhalations. If we therefore suppose that a bed is spread over a place where a volcano begins to work, it is evident that a great quantity of the water, always present on these occasions, is driven upwards in exhalations or vapours: these it is well known possess a penetrating softening power, by means of which they also produce  
their

<sup>1</sup> Lava. their first effect; but when they are increased to a sufficient quantity, they force this tough moist substance upwards, which then gradually falls, and during this time bursts in the manner described above.

“ My reasons for this opinion are these: First, we do not find the internal grain of the basalts melted or vitrified, which however soon happens by fusion, and for which purpose only a very small degree of fire is requisite. It consequently is very hard to explain, how this substance could have been so fluid, that no traces of bubbles appear in it (at least I have not been able to discover any, after the nicest examination into the Scotch and Icelandic basalts), and yet when broken appear dull and uneven. I know very well, that lava is seldom vitrified within; but the great number of bubbles and pores which are found in the whole mass, are more than sufficient proofs that it has not been perfectly melted to its smallest parts, but has only been brought to be near fluid. Secondly, the basalts so much resemble the finer trapp, both in respect to their grain and original composition, that they can hardly be distinguished in small fragments.”

These are the principal arguments on both sides of the question with regard to basalts, which yet seem far from being decisive on either.

<sup>11</sup> Vast quantities of lava thrown out. The quantity of matter thrown out from volcanoes under the name of *lava* is prodigious. After the great eruption of *Ætna* in 1669, Borelli went from Pisa to Sicily to observe the effects of it. The matter thrown out at that time amounted to 93,830,750 cubical paces; so that, had it been extended in length upon the surface of the earth, it would have reached more than four times round the whole earth. All this matter, however, was not lava, but consisted also of sand, stone, gravel, &c. The lava he computed at 6,300,000 paces, which formed a river, according to our author, sometimes two miles broad, but according to others it was six or seven miles broad, and sometimes 20 or 30 yards in depth. Sir William Hamilton informs us, that the lavas of *Ætna* are very commonly 15 or 20 miles in length, six or seven in breadth, and 50 feet deep. The most considerable is scarce less than 30 miles long and 15 broad. The most considerable lavas of *Vesuvius* do not exceed seven miles in length. The same author, however, tells us, that the lava which issued from *Vesuvius* in 1767, was six miles long, two in breadth, and in most places 60 or 70 feet deep. In one place it had run along a hollow-way made by currents of rain not less than 200 feet deep and 100 wide; and this vast hollow it had in one place filled up. He says, he could not have believed that so great a quantity of matter could have been thrown out in such a short time, if he had not examined the whole course of it himself.

As the lavas are thrown out from the volcanoes in the highest degree of ignition, it may easily be supposed that such vast bodies will retain their heat for a long time. It would indeed be well worth observing, what length of time is required to cool a lava perfectly; as from thence we might in some measure judge how far those philosophers are in the

right, who argue concerning the length of time required to cool an ignited globe of the size of our earth or larger. Sir William Hamilton tells us, that in the month of April 1771, he thrust sticks into some of the crevices of the lava which had issued from *Vesuvius* in October 1767, and they immediately took fire. On mount *Ætna*, in 1769, he observed the lava that had been disgorged three years before to smoke in many parts. No particular observation, however, hath been made in what proportion the heat of lavas is gradually lost.

Sir William Hamilton informs us of a curious fact<sup>13</sup> relating to a lava in the island called *Lucca*. Here is noxious vapours produced by cold and lavas. a cavern shut up with a door; and this cavern is made use of to cool liquors and fruit, which it does in a short time as effectually as ice. Before the door was opened, he felt the cold on his legs very sensibly; but when it was opened, the cold rushed out so as to give him pain; and within the grotto it was intolerable. He was not sensible of wind attending this cold; tho' upon Mount *Ætna* and *Vesuvius*, where there are caverns of this kind, the cold is evidently occasioned by a subterraneous wind: the natives call such places *ventaroli*. From old lavas there also frequently happens an eruption of noxious vapours called *mosfetes*. These likewise break out from wells and subterraneous places in the neighbourhood of a volcano before an eruption. Our author tells us, that the vapour affects the nostrils, throat, and stomach, just as the spirit of hartshorn or any strong volatile salt; and would soon prove fatal if you did not immediately withdraw from it. These *mosfetes*, he says, are at all times to be met with under the ancient lavas of *Vesuvius*, particularly the great eruption of 1631.

As to the nature and quality of lavas, Sir William Hamilton informs us, that those of *Ætna* and *Vesuvius* are much the same, but those of *Ætna* rather blacker and more porous than those of *Vesuvius*. Some kinds of lava take a fine polish, and are frequently manufactured into boxes, tables, &c. In Naples, the inhabitants commonly make use of it for paving the streets, and even the subterraneous cities of *Pompeii* and *Herculaneum* have been paved with the same substance. A fine large cubic piece of lava is preserved in the hall of the British Museum.

<sup>14</sup> LAVANDULA, LAVENDER, a genus of the gymnospermia order, belonging to the didymia class of plants.

*Species*. 1. The spica, or lavender spike, hath a short shrubby stalk, rising two or three feet high; small spear-shaped entire leaves; and from the ends of the branches, numerous, long, erect, naked spikes of small ringent flowers, of different colours in the varieties. The varieties of this are common narrow-leaved lavender, with blue flowers, and with white flowers—broad-leaved lavender—dwarf lavender: all of them flowering in July. This species is the common lavender; but the narrow-leaved variety, with blue flowers, is the sort commonly cultivated for its flowers for medicine, &c. The *stoechas*, or French lavender, hath a shrubby very branched stalk, rising two or three feet high; very narrow spear-shaped, pointed, hoary leaves, opposite; and all the branches terminated by short bushy spikes of purple flowers in June and July; succeeded

L. *lavandula*↑  
Lavatory.

ceded by seeds in August. There is a variety with white flowers. 3. The dentata, or dentate-leaved *stœchas*, hath a woody stalk, branching on every side three or four feet high; leaves deeply indented in a pinnated manner; and the branches terminated by scaly four-cornered spikes of flowers, appearing most part of summer.

*Culture.* All the sorts are propagated plentifully by slips or cuttings of their young shoots in spring. In March or April, take off a quantity of slips or cuttings, from three or four to six inches long; strip off the under leaves; then plant them in a shady border, four inches asunder; give a good watering, repeat it occasionally in dry weather, and the plants will be well-rooted in summer, and each become a good plant fit to be transplanted into any place early in autumn, that is September or October; removing them, if possible, with balls of earth; and if intended to plant them for use, set them in rows two or three feet asunder, and two feet distance in each row: if any are designed for the shrubbery, they should be stationed singly at good distances near the front. Those of the third sort being tender, should be potted to move to shelter in winter. The *lavandula stœchas* is also often raised from seed, sown in March or April, in a bed of light earth.

*Uses.* The two first species are proper both for the kitchen-garden, for medicinal and other family-uses; and to plant in the pleasure-ground to adorn the front of small shrubby compartments, where they will increase the variety very agreeably; and are finely-scented aromatics, both when growing, and their flowers when gathered, especially those of the first species, which are in great esteem for putting among cloaths, and for distilling and other economical uses. The flowers of the first sort are gathered for use in July; which being the time of their perfection, cut off the spikes close in a dry day, and tie them in small bunches for use. These and the summits are in a very eminent degree cephalic and nervine. They are given in paltries, vertigos, lethargies, tremors, and suppression of the menstrual evacuation. The compound spirit distilled from them is famous in these and many other like cases. The distilled oil is particularly celebrated for destroying the *pediculi inguinales*, and other cutaneous insects. If soft spongy paper, dipt in this oil, either alone, or mixed with oil of almonds, be applied at night to the parts infected, the insects will certainly, says Geoffroy, be all found dead in the morning.

*LAVATERA*, in botany, a genus of the polyandria order, belonging to the monodelphia class of plants. There are several species, most of them herbaceous flowery annuals, or shrubby perennials, growing erect from two or three to eight or ten feet high, garnished with large roundish, heart-shaped, and angular leaves, and quinquepetalous flowers of the mallow kind. They are easily propagated by seed in the open ground in the spring; and thrive best when sown where they are designed to remain.

*LAVATORY*, or *LAVADERO*, a name given to certain places in Chili and Peru, where gold is got out of earth by washing.

M. Frezier gives us the following description of the *lavatories* of Chili: "They dig deep into the earth, in such places as they have reason to expect gold in;

and, in order to facilitate this digging, turn a stream of water upon the spot, loosening the earth as much as possible all the time, that the current may have the greater effect, and tear up the earth more strongly. When they are got to the earth they want, they turn off the stream, and dig dry.

"The earth that they now get, is carried on mules, and discharged into a bafon, made somewhat in the manner of a smith's bellows; into which a little rivulet of water runs with a great deal of rapidity, dissolving the parts of the earth, and carrying every thing away with it, excepting the particles of gold, which, by their great weight, precipitate to the bottom of the bafon, and mix with a fine black sand, where they are almost as much hidden as they were before in the earth.

"Sometimes they find very considerable pieces in *lavatories*, particularly pieces of 24 ounces each.—There are several *lavatories*, where they find pepitas, or pieces of virgin gold, of a prodigious size. Among others, they tell of one that weighed 512 ounces, bought by the count de la Moncloa, viceroy of Peru.

"Nine or ten leagues to the east of Coquimbo, are the *lavatories* of Andacoll, the gold whereof is 23 carats fine.—Their work, here, always turn to great profit, excepting when the water fails them.—The natives maintain that the earth is creative, that is, it produces gold continually; because, after having been washed 60 or 80 years, they find it impregnated afresh, and draw almost as much out of it as at first.

*LAUBACH*, a handsome and strong town of Germany, in the circle of Austria, and in Carniola, with a bishop's see, a castle, and very handsome houses. It is seated on a river of the same name, wherein are the largest craw-fish in Europe. E. Long. 14. 45. N. Lat. 46. 20.

*LAUD* (William), archbishop of Canterbury in the 17th century, was born at Reading in 1573, and educated in St John's college, Oxford, of which he was afterwards a fellow and grammar-reader. In 1610, he went into orders. In 1611, he was elected president of St John's college; but his election being disputed, it was confirmed by his majesty. The same year he was sworn the king's chaplain. In 1621, he was nominated bishop of St David's. In 1628, he was translated to the bishopric of London. In 1630, he was elected chancellor of the university of Oxford. In 1633, he attended the king into Scotland, and was sworn a privy-counsellor for that kingdom. During his stay in Scotland, he formed the resolution of bringing that church to an exact conformity with the church of England. In the same year, he succeeded archbishop Abbot in the see of Canterbury; and soon after came out his majesty's declaration about lawful sports on Sundays, which the archbishop was charged with having revived and enlarged, and that with the vexatious prosecutions of such clergymen as refused to read it in their churches.

In 1634-5, the archbishop was put into the great committee of trade and the king's revenue; on the fourth of March following, he was appointed one of the commissioners of the treasury; and on the sixth of March 1635-6, he received the staff of lord high-treasurer

Laubach,  
Land.

1. a. u. furer of England.

1. a. u. f laughter.

In order to prevent the printing and publishing what he thought improper books, he procured a decree to be passed in the star-chamber, on the 11th of July 1637, whereby it was enjoined that the master-printers should be reduced to a certain number, and that none of them should print any books till they were licensed either by the archbishop, or the bishop of London, or some of their chaplains, or by the chancellors or vice-chancellors of the two universities.

A new parliament being summoned, met on the 13th of April 1640; and the convocation the day following; but the commons lancing out into complaints against the archbishop, and insisting upon a redress of grievances before they granted any supply, the parliament was dissolved on the 7th of May. The convocation, however, continued sitting; and made 17 canons, which were supposed to be formed under the immediate direction of the archbishop: In the beginning of the long parliament he was attacked on account of those canons: and they being condemned by the house of commons on the 16th of December 1640, "as containing many things contrary to the king's prerogative, to the fundamental laws and statutes of this realm, to the rights of parliament, to the property and liberty of the subject, and tending to sedition, and of dangerous consequence;" he was, on the 18th of December, accused by the commons of high treason, and sent to the Tower. Being tried before the house of lords, for endeavouring to subvert the laws, and to overthrow the Protestant religion, he was found guilty, and beheaded on Tower-hill on January 10th following, in the 72d year of his age.

This learned prelate, notwithstanding his being charged with a design to bring in Popery, wrote an answer to Dr Fisher, which is esteemed one of the best pieces that has been printed against that religion. He was temperate in his diet, and regular in his private life: but his fondness for introducing new ceremonies, in which he shewed a hot and indiscreet zeal, his encouraging of sports on Sundays, his illegal and cruel severity in the star-chamber and high-commission courts, and the fury with which he persecuted the dissenters, and all who presumed to contradict his sentiments, exposed him to popular hatred. Besides his answer to Fisher, he published several Sermons, and other works.

LAUDANUM. See OPIUM.

LAVENDER. See LAVANDULA.

LAUGHTER, an affection peculiar to mankind, occasioned by something that tickles the fancy.

In laughter, the eye-brows are raised about the middle, and drawn down next the nose; the eyes are almost shut; the mouth opens and shows the teeth, the corners of the mouth being drawn back and raised up; the cheeks seem puffed up, and almost hide the eyes; the face is usually red, the nostrils are open; and the eyes wet. See Plate XCV.

Authors attribute laughter to the fifth pair of nerves, which sending branches to the eye, ear, lips, tongue, palate, and muscles of the cheek, parts of the mouth, præcordia, &c. there hence arises a sympathy, or consent, between all these parts; so that when one of them is acted upon, the others are proportionably af-

fected. Hence a savoury thing seen, or smelt, affects the glands, and parts of the mouth; a thing seen, or heard, that is shameful, affects the cheeks with blushes; on the contrary, if it please and tickle the fancy, it affects the præcordia, and muscles of the mouth and face with laughter; if it cause sadness and melancholy, it likewise affects the præcordia, and demonstrates itself by causing the glands of the eyes to emit tears. Dr Willis accounts for the pleasure of kissing from the same cause; the branches of this fifth pair being spread to the lips, the præcordia, and the genital parts; whence arises a sympathy between those parts.

The affection of the mind by which laughter is produced, is seemingly very different from the other passions with which we are endowed, that it hath engaged the attention of very eminent persons to find it out.—1. Aristotle, in the fifth chapter of his Poetics, observes of comedy, that "it imitates those vices or meannesses only which partake of the ridiculous"—now the ridiculous (says he) consists of some fault or turpitude not attended with great pain, and not destructive." 2. "The passion of laughter, (says Mr Hobbes) is nothing else, but sudden glory arising from some sudden conception of some eminency in ourselves, by comparison with the infirmity of others, or with our own formerly. For men (continues he) laugh at the follies of themselves past, when they come suddenly to remembrance, except when we bring with them any sudden dishonour." 3. Akenfide, in the third book of his excellent poem, treats of ridicule at considerable length. He gives a detail of ridiculous characters; ignorant pretenders to learning, boastful soldiers, and lying travellers, hypocritical churchmen, conceited politicians, old women that talk of their charms and virtue, ragged philosophers who rail at riches, virtuosi intent upon trifles, romantic lovers, wits wantonly satirical, sops that out of vanity appear to be diseased and profligate, dastards who are ashamed or afraid without reason, and fools who are ignorant of what they ought to know. Having finished the detail of characters he makes some general remarks on the cause of ridicule; and explains himself more fully in a prose definition illustrated by examples. The definition, or rather description, is in these words. "That which makes objects ridiculous, is some ground of admiration or esteem connected with other more general circumstances comparatively worthless or deformed: or it is some circumstance of turpitude or deformity connected with what is in general excellent or beautiful; the inconsistent properties existing either in the objects themselves, or in the apprehension of the person to whom they relate; belonging always to the same order or class of being; implying sentiment and design, and exciting no acute or vehement commotion of the heart."—4. Hutcheson has given another account of the ludicrous quality, and seems to think that it is the contrast or opposition of dignity and meanness which occasions laughter.

All these opinions are refuted by Dr Beattie in his Essay on Laughter and Ludicrous Composition, where he has treated the subject in a masterly manner. "To provoke laughter, (says he), is not essential either to wit or humour. For though that unexpected discovery of resemblance between ideas supposed dissimilar, which is called

Laughter. called *Wit*—and that comic exhibition of singular characters, sentiments, and imagery, which is denominated *Humour*,—do frequently raise laughter, they do not raise it always. Addison's poem to Sir Godfrey Kneller, in which the British kings are likened to heathen gods, is exquisitely witty, and yet not laughable. Pope's *Essay on Man* abounds in serious wit; and examples of serious humour are not uncommon in Fielding's *History of Parson Adams*, and in Addison's account of Sir Roger de Coverley. Wit, when the subject is grave, and the allusions sublime, raises admiration instead of laughter: and if the comic singularities of a good man appear in circumstances of real distress, the imitation of these singularities in the epic or dramatic comedy will form a species of humour, which, if it should force a smile, will draw forth a tear at the same time. An inquiry, therefore, into the distinguishing characters of wit and humour has no necessary connection with the present subject.

"Some authors have treated of ridicule, without marking the distinction between *ridiculous* and *ludicrous* ideas. But I presume the natural order of proceeding in this inquiry is to begin with ascertaining the nature of what is *purely ludicrous*. Things *ludicrous* and things *ridiculous* have this in common, that both excite laughter; but the former excite pure laughter, the latter excite laughter mixed with disapprobation and contempt. My design is to analyse and explain that quality in things or ideas, which makes them provoke *pure laughter*, and entitles them to the name of *ludicrous* or *laughable*.

"When certain objects, qualities, or ideas, occur to our senses, memory, or imagination, we smile or laugh at them, and expect that other men should do the same. To smile on certain occasions is not less natural, than to weep at the sight of distress, or cry out when we feel pain.

"There are different kinds of laughter. As a boy, passing by night through a church-yard, sings or whistles in order to conceal his fear even from himself; so there are men, who, by forcing a smile, endeavour sometimes to hide from others, and from themselves too perhaps, their malevolence or envy. Such laughter is unnatural. The found of it offends the ear; the features distorted by it seem horrible to the eye. A mixture of hypocrisy, malice, and cruel joy, thus displayed on the countenance, is one of the most hateful sights in nature, and transforms the "human face divine" into the visage of a fiend.—Similar to this is the smile of a wicked person pleasing himself with the hope of accomplishing his evil purposes. Milton gives a striking picture of it in that well-known passage:

He cess'd; for both seem'd highly pleas'd; and Death  
Crin'd a horrible a ghastly smile, to hear  
His famine should be fill'd, and bless his maw  
Destin'd to that good hour.—

But enough of this. Laughter that makes man a fiend or a monster, I have no inclination to analyse. My inquiries are confined to that species of laughter which is at once natural and innocent.

"Of this there are two sorts. The laughter occasioned by tickling or gladness is different from that which arises on reading the Tale of a Tub. The former may be called *animal laughter*: the latter, (if it were lawful to adopt a new word which has become

very common of late) I should term *sentimental*.—Smiles admit of similar divisions. Not to mention the scornful, the envious, the malevolent smile, I would only remark, that of the innocent and agreeable smile there are two sorts. The one proceeds from the risible emotion, and has a tendency to break out into laughter. The other is the effect of good-humour, complacency, and tender affection. This last sort of smile renders a countenance amiable in the highest degree. Homer ascribes it to Venus in an epithet (*φειλεμένης*), which Dryden and Pope, after Waller, improperly translate *laughter-loving*; an idea that accords better with the character of a romp or hoyden, than with the goddess of love and beauty.

"Animal-laughter admits of various degrees; from the gentle impulse excited in a child by moderate joy, to that terrifying and even mortal convulsion which has been known to accompany a change of fortune. This passion may, as well as joy and sorrow, be communicated by sympathy; and I know not whether the entertainment we receive from the playful tricks of kittens and other young animals, may not in part be resolved into something like a fellow-feeling of their vivacity.—Animal and sentimental laughter are frequently blended; but it is easy to distinguish them. The former is often excessive; the latter never, unless heightened by the other. The latter is always pleasing, both in itself and in its cause; the former may be painful in both. But their principal difference is this:—The one always proceeds from a sentiment or emotion excited in the mind, in consequence of certain ideas or objects being presented to it, of which emotion we may be conscious even when we suppress laughter;—the other arises not from any sentiment, or perception of ludicrous ideas, but from some bodily feeling, or sudden impulse on what is called the *animal spirits*, proceeding, or seeming to proceed, from the operation of causes purely material. The present inquiry regards that species that is here distinguished by the name of *sentimental laughter*.

"The pleasing emotion, arising from the view of ludicrous ideas, is known to every one by experience; but, being a simple feeling, admits not of definition. It is to be distinguished from the laughter that generally attends it, as sorrow is to be distinguished from tears; for it is often felt in a high degree by those who are remarkable for gravity of countenance. Swift seldom laughed; notwithstanding his uncommon talents in wit and humour, and the extraordinary delight he seems to have had in surveying the ridiculous side of things. Why this agreeable emotion should be accompanied with laughter as its outward sign, or sorrow express itself by tears, or fear by trembling or paleness, I cannot ultimately explain, otherwise than by saying, that such is the appointment of the Author of nature.—All I mean by this inquiry is, to determine, "What is peculiar to those things which produce laughter;—or rather, which raise in the mind that pleasing sentiment or emotion whereof laughter is the external sign."

"Philosophers have differed in their opinions concerning this matter. In Aristotle's definition quoted above, it is clear that he means to characterise, not laughable qualities in general (as some have thought), but the objects of comic ridicule only; and in this

view the definition is just, however it may have been overlooked or despised by comic writers. Crimes and misfortunes are often in modern plays, and were sometimes in the ancient, held up as objects of public merriment; but if poets had that reverence for nature which they ought to have, they would not shock the common sense of mankind by so absurd a representation.—The definition from Aristotle does not, however, suit the general nature of ludicrous ideas; for it will appear by and by, that men laugh at that in which there is neither fault or turpitude of any kind.

"The theory of Mr Hobbes would hardly have deserved notice, if Addison had not spoken of it with approbation in the 47th paper of the *Spectator*. He justly observes, after quoting the words of Mr Hobbes formerly mentioned, that, "according to this account, when we hear a man laugh excessively, instead of saying that he is very merry, we ought to tell him that he is very proud." It is strange, that the elegant author should be aware of this consequence, and yet admit the theory: for so good a judge of human nature could not be ignorant, that laughter is not considered as a sign of pride; persons of singular gravity being often suspected of that vice, but great laughers seldom or never. When we see a man attentive to the innocent humours of a merry company, and yet maintain a fixed solemnity of countenance, is it natural for us to think that he is the humblest, and the only humble person in the circle?

"Another writer in the *Spectator*, n° 249, remarks, in confirmation of this theory, that the *vainest* part of mankind are most addicted to the passion of laughter. Now, how can this be, if the *proudest* part of mankind are also most addicted to it, unless we suppose vanity and pride to be the same thing? But they certainly are different passions. The proud man despises other men, and derives his chief pleasure from the contemplation of his own importance; the vain man stands in need of the applause of others, and cannot be happy without it. Pride is apt to be reserved and sullen; vanity is often affable, and officiously obliging. The proud man is so confident of his merit, and thinks it so obvious to all the world, that he will scarce give himself the trouble to inform you of it: the vain man, to raise your admiration, scruples not to tell you, not only the whole truth, but even a great deal more. In the same person these two passions may, no doubt, be united; but some men are too proud to be vain, and some vain men are too conscious of their own weakness to be proud. Be all this, however, as it will, we have not as yet made any discovery of the cause of laughter: in regard to which, I apprehend, that the vain are not more intemperate than other people; and I am sure that the proud are much less so.

"Hutcheson's account of the origin of laughter is equally unsatisfactory. Granting what he says to be true, I would observe, in the first place, what the ingenious author seems to have been aware of, that there may be a mixture of meanness and dignity where there is nothing ludicrous. A city, considered as a collection of low and lofty houses, is no laughable object. Nor was that person either ludicrous or ridiculous, whom Pope so justly characterises,

"The greatest, wisest, meanest, of mankind."

—But, secondly, cases might be mentioned, of laughter arising from a group of ideas or objects, where there is no discernible opposition of meanness or dignity. We are told of the dagger of Hudibras, that

"It could scrape trenchers, or chip bread,  
"Toast cheese or bacon, though it were  
"To bait a mouse-trap, 'twould not care;  
" 'Twould make clean shoes, or in the earth  
"Set leeks and onions, and so forth."

The humour of the passage cannot arise from the meanness of these offices compared with the dignity of the dagger, nor from any opposition of meanness and dignity in the offices themselves, they being all equally mean; and must therefore be owing to some peculiarity in the description. We laugh, when a droll mimics the solemnity of a grave person; here dignity and meanness are indeed united: but we laugh also, (tho' not so heartily perhaps), when he mimics the peculiarities of a fellow as insignificant as himself, and displays no opposition of dignity and meanness. The levities of Sancho Panca opposed to the solemnity of his master, and compared with his own schemes of preferment, form an entertaining contrast: but some of the vagaries of that renowned squire are truly laughable even when his preferment and his master are out of the question. Men laugh at puns; the wisest and wittiest of our species have laughed at them; queen Elizabeth, Cicero, and Shakespear, laughed at them; clowns and children laugh at them; and most men, at one time or other, are inclined to do the same: but in this sort of low wit, is it an opposition of meanness and dignity that entertains us? Is it not rather a mixture of meanness and diversity,—famelessness in the sound, and diversity in the signification?

"In the characters mentioned by Akenfield, the author does not distinguish between what is *laughable* and what is *contemptible*; so that we have no reason to think, that he meant to specify the qualities peculiar to those things which provoke *pure laughter*; and whatever account we may make of his definition, which to those who acquiesce in the foregoing reasonings may perhaps appear not quite satisfactory, there is in the poem a passage that deserves particular notice, as it seems to contain a more exact account of the ludicrous quality, than is to be found in any of the theories abovementioned. This passage we shall soon have occasion to quote."

Our author now goes on to lay down his own theory concerning the origin of laughter, which he supposes to arise from the view of things incongruous united in the same assemblage. "However imperfect (says he) the abovementioned theories may appear, there is none of them destitute of merit; and indeed the most fanciful philosopher seldom frames a theory without consulting nature in some of her more obvious appearances. Laughter very frequently arises from the view of dignity and meanness united in the same object; sometimes, no doubt, from the appearance of assumed inferiority, as well as of small faults and unimportant turpitudes; and sometimes, perhaps, though rarely, from that sort of pride which is described in the passage already quoted from Hobbes.

"All these accounts agree in this, that the cause of laughter

Laughter.

laughter is something compounded; or something that disposes the mind to form a comparison, by passing from one object or idea to another. That this is in fact the case, cannot be proved *a priori*; but this holds in all the examples hitherto given, and will be found to hold in all that are given hereafter. May it not then be laid down as a principle, That laughter arises from the view of two or more objects or ideas disposing the mind to form a comparison? According to the theory of Hobbes, this comparison would be between the ludicrous object and ourselves; according to those writers who misapply Aristotle's definition, it would seem to be formed between the ludicrous object and things or persons in general; and if we incline to Hutcheson's theory, which is the best of the three, we shall think that there is a comparison of the parts of the ludicrous object, first with one another, and secondly with ideas or things extraneous.

"Further: every appearance that is made up of parts, or that leads the mind of the beholder to form a comparison, is not ludicrous. The body of a man or woman, of a horse, a fish, or a bird, is not ludicrous, though it consists of many parts; and it may be compared to many other things without raising laughter: but the picture described in the beginning of the epistle to the *Pisb's*, with a man's head, a horse's neck, feathers of different birds, limbs of different beasts, and the tail of a fish, would have been thought ludicrous 1800 years ago, if we believe Horace, and in certain circumstances would no doubt be so at this day. It would seem then, that 'the parts of a laughable assemblage must be in some degree unsuitable and heterogeneous.'

"Moreover: any one of the parts of the Horatian monster, a human head, a horse's neck, the tail of a fish, or the plumage of a fowl, is not ludicrous in itself; nor would those several parts be ludicrous, if attended to in succession, without any view to their union. For to see them disposed on the different shelves of a museum, or even on the same shelf, nobody would laugh, except, perhaps, the thought of uniting them were to occur to his fancy, or the passage of Horace to his memory. It seems to follow, that "the incongruous parts of a laughable idea or object must either be combined so as to form an assemblage, or must be supposed to be so combined."

"May we not then conclude, that "laughter arises from the view of two or more inconsistent, unsuitable, or incongruous parts or circumstances, considered as united in one complex object or assemblage, or as acquiring a sort of mutual relation from the peculiar manner in which the mind takes notice of them." The lines from Akenfide formerly referred to, seem to point at the same doctrine:

Where-e'er the pow'r of ridicule displays  
Her quaint-eye'd visage, *some incongruous form,*  
*Some stubborn dissonance of things combined,*  
Strikes on the quick observer.

And to the same purpose, the learned and ingenious Dr Gerard, in his *Essay on Taste*: 'The sense of ridicule is gratified by an inconsistency and dissonance of circumstances in the same object, or in objects nearly related in the main; or by a similitude or a relation unexpected between things on the whole opposite and

unlike.'

"And therefore, instead of saying, with Hutcheson, that the cause or object of laughter is an 'opposition of dignity and meanness;' I would say, in more general terms, that it is 'an opposition of suitableness or unsuitableness, or of relation and the want of relation, united, or supposed to be united, in the same assemblage.' Thus the offices ascribed to the dagger of Hudibras seem quite heterogeneous; but we discover a bond of connection among them, when we are told that the same weapon could occasionally perform them all. Thus, even in that mimicry which displays no opposition of dignity and meanness, we perceive the actions of one man joined to the features and body of another; that is, a mixture of unsuitableness, or want of relation, arising from the difference of persons, with congruity and similitude, arising from the sameness of the actions. And here let it be observed in general, that the greater number of incongruities that are blended in the same assemblage, the more ludicrous it will probably be. If, as in Butler's resemblance of the morning to a boiled lobster, there is a mixture of dignity and meanness, as well as of likeness and dissimilitude, the effect of the contrast will be more powerful, than if only one of these oppositions had occurred in the ludicrous idea. The sublimity of Don Quixote's mind, contrasted and connected with his miserable equipage, forms a very comical exhibition; but when all this is still further connected and contrasted with Sancho Panca, the ridicule is heightened exceedingly. Had the knight of the lions been better mounted and accoutred, he would not have made us smile so often; because, the hero's mind and circumstances being more adequately matched, the whole group would have united fewer inconsistencies, and reconciled fewer incongruities. Butler has combined a still greater variety of uncouth and jarring circumstances in Ralpho and Hudibras: but the picture, though more elaborate, is less natural. Yet this argues no defect of judgment. His design was, to make his hero not only ludicrous but contemptible; and therefore he jumbles together, in his equipage and person, a number of mean and disgusting qualities, pedantry, ignorance, nastiness, and extreme deformity. But the knight of La Mancha, though a ludicrous, was never intended for a contemptible, personage. He often moves our pity, he never forfeits our esteem; and his adventures and sentiments are generally interesting: which could not have been the case if his story had not been natural, and himself been endowed with great as well as good qualities. To have given him such a shape, and such weapons, arguments, boots, and breeches, as Butler has bestowed on his champion, would have destroyed that solemnity which is so striking a feature in Don Quixote; and Hudibras, with the manners and person of the Spanish hero, would not have been that paltry figure which the English poet meant to hold up to the laughter and contempt of his countrymen. Sir Launcelot Greaves is of Don Quixote's kindred, but a different character. Smollet's design was, not to expose him to ridicule; but rather to recommend him to our pity and admiration. He has therefore given him youth, strength, and beauty, as well as courage and dexterity of mind; has mounted him on a generous steed, and arrayed him in an elegant suit

Laughter.

Laughter  
Laurch.

of armour. Yet, that the history might have a comic air, he has been careful to contrait and connect Sir Launcelot with a fquire and other associates of very dissimilar tempers and circumstances.

"What has been said of the cause of laughter does not amount to an exact description, far less to a logical definition: there being innumerable combinations of congruity and incongruity, of relation and contrariety, of likeness and dissimilitude, which are not ludicrous at all. If we could ascertain the peculiarities of these, we should be able to characterise with more accuracy the general nature of ludicrous combination. But before we proceed to this, it would be proper to evince, that of the present theory thus much at least is true, that though every incongruous combination is not ludicrous, every ludicrous combination is incongruous.

"It is only by a detail of facts or examples that any theory of this sort can be either established or overthrown. By such a detail, the foregoing theories have been, or may be, shewn to be ill-founded, or not sufficiently comprehensive. A single instance of a laughable object, which neither unites, nor is supposed to unite, incongruous ideas, would likewise show the insufficiency of the present; nor will I undertake to prove, (for indeed I cannot), that no such instance can be given. A complete enumeration of ludicrous objects it would be vain to attempt: and therefore we can never hope to ascertain, beyond the possibility of doubt, that common quality which belongs to all ludicrous ideas that are, or have been, or may be imagined. All that can be done in a case of this kind is to prove by a variety of examples, that the theory now proposed is more comprehensive, and better founded, than any of the foregoing." This our author afterwards shews at full length; but as the variety of examples adduced by him would take up too much room to be inserted here, and as every reader must be capable of adducing numberless instances of ludicrous cases to himself, we shall content ourselves with the above explanation of the different theories of laughter, referring those who desire further satisfaction to the treatise already quoted.

*Involuntary LAUGHTER.* See (the *Index*) subjoined to MEDICINE.

*Sardonic LAUGHTER.* *Ibid.*

**LAVINIUM**, (anc. geog.) a town of Latium, six miles to the east of Laurentum, according to an ancient map; so named from *Lavinia*, consort of *Æneas*, and daughter of king *Latinus*; and built by the Trojans. The first town of Roman origin in Latium, and the seat of the *Dii Penates*, (*Livy*;) situated near the river *Numicus*, or *Numicius*; between which and the *Tiber* *Æneas* landed, according to *Virgil*. *Holstenius* supposes the town to have stood on an eminence, now called *il Monte di Levano*.

**LAUNCESTON**, a town of Cornwall in England, seated on the river *Tamar* on the top of a small hill, and is a large corporation sending two members to parliament. It was formerly defended by a castle, which is now in ruins. *W. Long*. 4. 55. *N. Lat.* 50. 40.

**LAUNCH**, in the sea-language, signifies to put out: as, *Launch the ship*, that is, Put her out of dock; *launch aft*, or *forward*, speaking of things that are

stowed in the hold, is, put them more forward; *launch her*! is a term used when a yard is hoisted high enough, and signifies, *hoist no more*.

**LAURA**, in church-history, a name given to a collection of little cells at some distance from each other, in which the hermits in ancient times lived together in a wilderness.

These hermits did not live in community, but each monk provided for himself in his distinct cell. The most celebrated lauras mentioned in ecclesiastical history were in Palestine; as the *laura* of *St Euthymus*, at four or five leagues distance from Jerusalem; the *laura* of *St Saba*, near the brook *Cedron*; the *laura* of the *Towers*, near the river *Jordan*, &c.

**POET-LAUREATE**, an officer of the household of the kings of Britain, whose business consists only in composing an ode annually on his majesty's birth-day, and on the new-year; sometimes also, though rarely, on occasion of any remarkable victory.—Of the first institution of poets laureate, Mr *Wharton* has given the following account in his history of English poetry.

"Great confusion has entered into this subject, on account of the degrees in grammar, which included rhetoric and versification, anciently taken in our universities, particularly at Oxford: on which occasion, a wreath of laurel was presented to the new graduate, who was afterwards usually styled *Poeta Laureatus*. These scholastic laureations, however, seem to have given rise to the appellation in question. I will give some instances at Oxford, which at the same time will explain the nature of the studies for which our academical philologists received their rewards. About the year 1470, one *John Watson*, a student in grammar, obtained a concession to be graduated and laureated in that science; on condition that he composed one hundred Latin verses in praise of the university, and a Latin comedy. Another grammarian was distinguished with the same badge, after having stipulated, that, at the next public act, he would affix the same number of hexameters on the great gates of *St Mary's church*, that they might be seen by the whole university. This was at that period the most convenient mode of publication. About the same time, one *Maurice Byrchenfaw*, a scholar in rhetoric, supplicated to be admitted to read lectures, that is, to take a degree, in that faculty; and his petition was granted, with a provision, that he should write one hundred verses on the glory of the university, and not suffer *Ovid's Art of Love*, and the *Elegies of Pampilius*, to be studied in auditory. Not long afterwards, one *John Bulman*, another rhetorician, having complied with the terms imposed, of explaining the first book of *Tully's Offices*, and likewise the first of his *Epistles*, without any pecuniary emolument, was graduated in rhetoric; and a crown of laurel was publicly placed on his head by the hands of the chancellor of the university. About the year 1489, *Skelton* was laureated at Oxford, and in the year 1493 was permitted to wear his laurel at Cambridge. *Robert Whittington* affords the last instance of a rhetorical degree at Oxford. He was a secular priest, and eminent for his various treatises in grammar, and for his facility in Latin poetry: having exercised his art many years, and submitting to the customary demand of an hundred verses, he was ho-

Laura,  
Laureate.

noured with the laurel in the year 1512.

"With regard to the poet-laureate of the kings of England, he is undoubtedly the fame that is styled the *king's versifier*, and to whom 100 shillings were paid as his annual stipend, in the year 1251. But when or how that title commenced, and whether this officer was ever solemnly crowned with laurel at his first investiture, I will not pretend to determine, after the searches of the learned Selden on this question have proved unsuccessful. It seems most probable, that the barbarous and inglorious name of *versifier* gradually gave way to an appellation of more elegance and dignity; or rather, that at length those only were in general invited to this appointment, who had received academical sanction, and had merited a crown of laurel in the universities for their abilities in Latin composition, particularly Latin versification. Thus the *king's laureate* was nothing more than "a graduated rhetorician employed in the service of the king." That he originally wrote in Latin, appears from the ancient title *versificator*; and may be moreover collected from the two Latin poems, which Bafton and Gulielmus, who appear to have refpectively acted in the capacity of royal poets to Richard I. and Edward II. officially composed on Richard's crusade, and Edward's siege of Striveling caſtle.

"Andrew Bernard, ſucceſſively poet-laureate of Henry VII. and VIII. affords a ſtill ſtronger proof that this officer was a Latin ſcholar. He was a native of Tholouſe, and an Auguſtine monk. He was not only the king's poet-laureate, as it is ſuppoſed, but his hiſtoriographer, and preceptor in grammar to Prince Arthur. He obtained many eccleſiaſtical preferments in England. All the pieces now to be found, which he wrote in the character of poet-laureate, are in Latin. Theſe are, "An *Addeſſe* to Henry VIII. for the moſt auſpicious beginning of the 10th year of his reign, with an *Epithalamium* on the marriage of Francis the dauphin of France with the king's daughter;" *A New Year's Gift* for the 1515; and, *Verſes wiſhing proſperity to his majeſty's 13th year*. He has left ſome Latin hymns; and many of his Latin proſe pieces, which he wrote in the quality of hiſtoriographer to both monarchs, are remaining.

"I am of opinion, that it was not cuſtomary for the royal laureate to write in Engliſh, till the reformation of religion had begun to diminiſh the veneration for the Latin language; or rather, till the love of novelty, and a better ſenſe of things, had baniſhed the narrow pedantries of monaſtic erudition, and taught us to cultivate our native tongue."

LAURENTIALIA, or LAURENTALIA, called alſo *Laurentinalia*, *Laurentales*, and *Larentales*, feaſts celebrated among the Romans on the tenth of the kalends of January, or 23d of December, in memory of Acca Laurentia, wife of the ſhepherd Faſtulus, and nurſe of Romulus and Remus.

LAURENTIUS, one of the firſt printers, and, according to ſome, the inventor of the art, was born at Harleim about the year 1370, and executed ſeveral departments of magiſtracy of that city. Thoſe writers are miſtaken, who aſſign to him the ſurname of *Coffer*, or aſſert that the office of *ædituus* was hereditary in his family. In a diploma of Albert of Bavaria in 1380, in which, among other citizens of Har-

leim, our Laurentius's father is mentioned by the Laurentius name of *Joannes Laurentii filius*," Beroldus is called *ædituus*, who was ſurely of another family; and in 1396 and 1398, Henricus a Lumen enjoyed that office; after whole reſignation, Count Albert conferring on the citizens the privilege of electing their *ædituus*, they, probably ſoon after, fixed on Laurentius; who was afterwards called *Coffer*, from his office, and not from his family-name, as he was defended from an illegitimate branch of the Gens Brerodoria. His office was very lucrative; and that he was a man of great property, the elegance of his houſe may teſtify. That he was the inventor of printing, is aſſerted in the narrative of Junius. His firſt work was an *Horarium*, containing the Letters of the alphabet, the Lord's prayer, the apoſtles creed, and two or three ſhort prayers; the next was the *Speculum ſalutis*, in which he introduced *pictures on wooden blocks*; then *Donatus*, the larger ſize; and afterwards the ſame work in a leſs ſize. All theſe were printed on *ſeparate moveable wooden types* faſtened together by threads. If it be thought improbable, that ſo ingenious a man ſhould have proceeded no farther than the invention of *wooden types*; it may be answered, that he printed for profit, not for fame; and *wooden types* were not only at that time made ſooner and cheaper than *metal* could be, but were ſufficiently durable for the ſmall impreſſions of each book he muſt neceſſarily have printed.—His preſs was nearly ſhaped like the common wine-pretleſs.—He printed ſome copies of *all* his books both on paper and vellum.—It has been very erroneouſly ſuppoſed, that he quitted the profeſſion, and died broken-hearted: but it is certain, that he did not live to ſee the art brought to perfection.—He died in 1440, aged 70; and was ſucceeded either by his ſon-in-law Thomas Peter, who married his only daughter Lucia; or by their immediate deſcendants, Peter, Andrew, and Thomas; who were old enough (even if their father was dead, as it is likely he was) to conduct the buſineſs, the eldeſt being at leaſt 22 or 23. What books they printed, it is not eaſy to determine; they having, after the example of Laurentius (more anxious for profit than for fame), neither added to their books their names, the place where they were printed, or the date of the year. Their firſt eſſays were new editions of *Donatus* and the *Speculum*. They afterwards re-printed the latter, with a Latin tranſlation; in which they uſed their grandfather's wooden pictures; and printed the book partly on *wooden blocks*, partly on *wooden ſeparate types*, according to Mr Meerman, who has given an exact engraving of *each ſort*, taken from different parts of the ſame book, which was publiſhed between the years 1442 and 1450. Nor did they ſtop here: they continued to print ſeveral editions of the *Speculum*, both in Latin and in Dutch; and many other works, particularly "Hiſtoria Alexandri Magni;" "Flavii Vegetii [for Vegetii] Renati Epitome de Re Militari;" and "Opera varia a Thomas Kempis." Of each of theſe Mr Meerman has given an engraved ſpecimen. They were all printed with *ſeparate wooden types*; and, by their great neatneſs, are a proof that the deſcendants of Laurentius were induſtrious in improving his invention. Kempis was printed at Harleim in 1472, and was the laſt known work of Laurentius's deſcendants, who

who soon after disposed of all their materials, and probably quitted the employment; as the use of *suffle types* was about that time universally diffused through Holland, by the settling of Martens at Alost, where he pursued the art with reputation for upwards of 60 years. See (*History of*) PRINTING.

LAURENTIUM, (anc. geog.), a town of Latium, supposed to be the royal residence of those most ancient kings Latinus, Picus, and Faunus, (Virgil). Hither the emperor Commodus retired, during a pestilence. Its name was from an adjoining grove of bay-trees, midway between Ostia and Antium. Supposed to have stood in the place now called *San Lorenzo*; which seems to be confirmed from the *Via Laurentina* leading to Rome.

LAURO (Philippo), a celebrated painter, born at Rome in 1623. He learned the first rudiments of the art from his father Balthazar, who was himself a good painter. He afterward studied under Angelo Carofello, his brother-in-law; and proved so great a proficient, that in a short time he far surpassed his tutor in design, colouring, and elegance of taste. He applied himself to painting historical subjects in a small size, enriching the backgrounds with lively landscapes, that afforded the eye and the judgment equal entertainment; but though his small paintings are best approved, he finished several grand compositions for altar-pieces that were highly esteemed. He died in 1694; and his works are eagerly bought up at high prices all over Europe.

LAURUS, the BAY-TREE; a genus of the monogynia order, belonging to the æneandria class of plants.

*Species.* 1. The nobilis, or common bay-tree, is a native of Italy, and hath an upright trunk branching on every side from the bottom upward, rising 20 or 30 feet high; spear-shaped, nervous, stiff, evergreen leaves, three inches long and two broad; with small, yellowish, quadrifid, dioecious flowers, succeeded by red berries in autumn and winter. Of this species there are varieties, with broad, narrow, striped, or waved leaves. 2. The æstivalis grows naturally in North America. It rises with an upright stem, branching eight or ten feet high, covered with a purplish bark; oblong, oval, acuminate, veined, deciduous leaves, two or three inches long, and half as broad; growing opposite; with small white flowers succeeded by red berries in those places where it is native, but not in this country. 3. The benzoin, or benjamin tree, is also a native of North America; grows 15 or 20 feet high, divided into a very branching head; with oval, acute, unveined, deciduous leaves, three or four inches long, and half as broad; and small yellowish flowers, not succeeded by berries in this country. 4. The sassafras is a native of the same country. It hath a shrub-like straight stem, branching 10 or 15 feet high; garnished with both oval and three-lobed, shining, deciduous leaves, of different sizes, from three to six inches long, and near as broad, with small yellowish flowers succeeded by blackish berries, but not in this country. 5. The indica, or indian bay-tree, rises with an upright straight trunk, branching regularly 20 or 30 feet high; adorned with very large, spear-shaped, plane, nervous, evergreen leaves on reddish footstalks; and branches of small whitish-green flowers, succeeded

by large oval black berries that do not ripen in this country. 6. The borbonia, or Carolina red bay-tree, rises with an upright straight stem, branching 15 or 20 feet high; with large, spear-shaped, evergreen leaves, transversely veined; and long bunches of flowers on red footstalks, succeeded by large blue-berries fitting in red cups. 7. The camphora, or camphor-tree, grows naturally in the woods of the western parts of Japan, and in the adjacent islands. The root smells stronger of camphor than any of the other parts, and yields it in greater plenty. The bark of the stalk is outwardly somewhat rough; but in the inner surface smooth and mucous, and therefore easily separated from the wood, which is dry and of a white colour. The leaves stand upon slender footstalks, have an entire undulated margin, running out into a point; have the upper sur- of a lively and shining green, the lower herbaceous and silky; and are furnished with a few lateral nerves, which stretch archwise to the circumference, and frequently terminate in small warts; a circumstance peculiar to this species of laurel. The flowers are produced on the tops of footstalks, which proceed from the arm-pits of the leaves; but not till the tree has attained considerable age and size. The flower-stalks are slender, branched at the top, and divided into very short pedicles, each supporting a single flower. These flowers are white, and consist of six petals, which are succeeded by a purple and shining berry of the size of a pea, and in figure somewhat top-shaped. It is composed of a soft pulpy substance that is purple, and has the taste of cloves and camphor; and of a nucleus or kernel of the size of a pepper, that is covered with a black, shining, oily cortice, of an insipid taste. 8. The cinnamomum, or cinnamon-tree, is a native of Ceylon. It hath a large root, and divides into several branches, covered with a bark, which on the outer side is of a greyish brown, and on the inside has a reddish cast. The wood of the root is hard, white, and has no smell. The body of the tree, which grows to the height of 40 or 50 feet, is covered, as well as its numerous branches, with a bark which at first is green and afterwards red. The leaf is longer and narrower than the common bay-tree. When first unfolded, it is of a flame colour: but after it has been for some time exposed to the air and grows dry, it changes to a deep green on the upper surface, and to a lighter on the lower. The flowers are small and white, and grow in large bunches at the extremity of the branches: they have an agreeable smell, something like that of the lily of the valley. The fruit is shaped like an acorn, but is not so large.

*Culture.* The common sort is propagated either by seed, layers, or suckers. The seed should be sowed after the berries are ripe, or early in the spring, covering them with earth near an inch deep, or in drills half a foot asunder, the same depth. The plants will come up late in the spring. They must be frequently watered during summer, and in winter screened from the severe frost by means of mats or some other covering; and after having two summers growth in the seed-bed, transplant the strongest of them in the following spring two feet asunder, and a foot apart in each row; giving water in dry weather till they have taken good root, and hoeing down the weeds in summer. Here they may remain till half a yard or two

Laurus.

or three feet high; and then planted out into the shrubbery in autumn or spring. If the berries are sowed in pots and plunged in a hot-bed in spring, it will bring the plants better forward. The deciduous bay, Benjamin, and sassafras-tree, are propagated in the same manner. The Indian bay, the camphor, and the cinnamon-tree, require the treatment common to green-house plants.

*Ufer.* The leaves and berries of the common bay-tree have a moderately strong aromatic smell, and a warm, bitterish, pungent taste: the berries are stronger in both respects than the leaves, and afford in distillation a larger quantity of essential aromatic oil; they yield also an almost insipid oil to the press, in consequence of which they prove unctuous in the mouth. They are warm carminatives, and sometimes exhibited in this intention against stultent colics, and likewise in hysterical disorders. Their principal use in the present practice is in glysters, and some external applications. The uses of BENZOIN and CAMPHOR have been explained under these articles and the places referred to. The root of the sassafras has a fragrant smell, and a sweetish, aromatic, subacid taste; the bark tastes much stronger than any other part; and the small twigs stronger than the large pieces. It is a warm aperient and corroborant, and frequently employed with good success for purifying and sweetening the blood and juices. For these purposes, infusions made from the rasped root or bark may be drank as tea. In some constitutions indeed, such liquors are, by their fragrance, apt, on first taking them, to affect the head; but in such cases they may be advantageously freed from their flavour by boiling. A decoction of sassafras, boiled down to the consistence of an extract, proves simply bitterish and subastrigent. Hoffman assures us, that he has frequently given this extract to the quantity of a scruple at a time, with remarkable success, for strengthening the tone of the viscera in cachexies; as also in the decline of intermittent fevers, and in hypochondriacal spasms. Sassafras yields in distillation an extremely fragrant oil of a penetrating pungent taste, so ponderous (notwithstanding the lightness of the drug itself) as to sink in water. Rectified spirit extracts the whole taste and smell of sassafras; and elevates nothing in evaporation: hence the spirituous extract proves the most elegant and efficacious preparation, as containing the virtue of the root entire.

The cinnamon is the under-bark of the *laurus cinnamomum* above-described. The best season for separating it from the outer-bark, which is grey and rugged, is the spring, when the sap flows in the greatest abundance. It is cut into thin slices, and exposed to the sun, and curls up in drying.—The old trees produce a coarse kind of cinnamon; the spice is in perfection only when the trees are not older than three or four years. When the trunk has been stripped of its bark, it receives no further nourishment; but the root is still alive, and continues to throw out fresh shoots. The fruit of the tree is shaped like an acorn, but is not so large. It contains a seed from whence the tree may be raised, and is commonly ripe in September. When boiled in water, it yields an oil which swims at top, and takes fire. If left to cool, it hardens

into a white substance, of which candles are made which have an agreeable smell, and are reserved for the use of the king of Ceylon. The cinnamon is not reckoned excellent unless it be fine; smooth, brittle, thin, of a yellow colour inclining to red; fragrant, aromatic, and of a poignant, yet agreeable taste. The connoisseurs give the preference to that the pieces of which are long, but slender. That which comes to us is generally mixed with the Cassia bark; but this last is easily distinguished. Cinnamon splinters in breaking, and has a roughness along with its aromatic flavour; while the Cassia breaks over smooth, and has a mucilaginous taste. Cinnamon is a very elegant and useful aromatic, more grateful both to the palate and stomach than most other substances of this class. By its astrigent quality it likewise corroborates the viscera, and proves of great service in several kinds of alvine fluxes, and immoderate discharges from the uterus.

LAUSANNE, a large, ancient, and handsome town of Switzerland, capital of the country of Vaud, and in the canton of Bern, with a famous college, and bishop's see. The town-house and the other public buildings are magnificent. It is seated between three hills, near the lake of Geneva, in E. Long. 6. 33. N. Lat. 46. 30.

LAVORI (TERRA DI), a province of Italy, in the kingdom of Naples, bounded on the west by the Campagna of Rome, and by Farther Abruzzo; on the north, by the Citerior Abruzzo, and by the county of Molissa; on the east, by the Ultra Principato; and on the south, by the Principato Citra. It is about 63 miles in length, and 35 in breadth; and is fertile in corn, excellent vines, and other fruits. There are also several mineral springs, and mines of sulphur; Naples is the capital town.

LAW (John), of Edinburgh, the famous projector, who raised himself to the dignity of comptroller-general of the finances of France, upon the strength of a scheme for establishing a bank, an East-India and a Mississippi company, with the profits of which, the national debt of France was to be paid off. He first offered his plan to Victor Amadeus, king of Sardinia; who told him, "he was not powerful enough to ruin himself." The French ministry accepted it in 1710. In 1716 he opened a bank in his own name, under the protection of the duke of Orleans, regent of France: most of the people of property of every rank in France, seduced by the prospect of immense gains, subscribed for shares in the bank and the companies. In 1718, Law's was declared a royal bank, and the shares rose to more than 20 times the original value; so that, in 1719, they were worth more than 80 times the amount of all the current specie in the kingdom. But the following year, this great fabric of false credit fell to the ground, and almost overthrew the French government, ruining some thousands of families; and it is remarkable, that the same desperate game was played by the South-sea directors in England, in the same fatal year, 1720. Law being exiled as soon as the credit of his projects began to fail, retired to Venice, where he died in 1729.

## L A W.

## PART I. OF THE NATURE OF LAWS IN GENERAL.

<sup>1</sup>  
Definition;  
general,  
and

LAW, in its most general and comprehensive sense, signifies a rule of action; and is applied indiscriminately to all kinds of action, whether animate or inanimate, rational or irrational. Thus we say, the laws of motion, of gravitation, of optics, or mechanics, as well as the laws of nature and of nations. And it is that rule of action, which is prescribed by some superior, and which the inferior is bound to obey.

Thus when the Supreme Being formed the universe, and created matter out of nothing, he impressed certain principles upon that matter, from which it can never depart, and without which it would cease to be. When he put that matter into motion, he established certain laws of motion, to which all moveable bodies must conform. And, to descend from the greatest operations to the smallest, when a workman forms a clock, or other piece of mechanism, he establishes at his own pleasure certain arbitrary laws for its direction; as, that the hand shall describe a given space in a given time; to which law as long as the work conforms, so long it continues in perfection, and answers the end of its formation.

If we farther advance, from mere inactive matter to vegetable and animal life, we shall find them still governed by laws; more numerous indeed, but equally fixed and invariable. The whole progress of plants, from the seed to the root, and from thence to the seed again; the method of animal nutrition, digestion, secretion, and all other branches of vital economy;—are not left to chance, or the will of the creature itself, but are performed in a wondrous involuntary manner, and guided by unerring rules laid down by the great Creator.

This then is the general signification of law, a rule of action dictated by some superior being; and, in those creatures that have neither the power to think, nor to will, such laws must be invariably obeyed, so long as the creature itself subsists, for its existence depends on that obedience. But laws, in their more confined sense, and in which it is our present business to consider them, denote the rules, not of action in general, but of *human* action or conduct: that is, the precepts by which man, the noblest of all sublunary beings, a creature endowed with both reason and free-will, is commanded to make use of those faculties in the general regulation of his behaviour.

Man, considered as a creature, must necessarily be subject to the laws of his Creator, for he is entirely a dependent being. A being, independent of any other, has no rule to pursue, but such as he prescribes to himself: but a state of dependence will inevitably oblige the inferior to take the will of him on whom he depends, as the rule of his conduct; not indeed in every particular, but in all those points wherein his dependence consists. This principle therefore has more or less extent and effect, in proportion as the superiority of the one and the dependance of the other is greater or less, absolute or limited. And consequently, as man depends absolutely upon his Maker for every thing,

it is necessary that he should in all points conform to his Maker's will.

This will of his Maker is called the *law of nature*.<sup>2</sup> For as God, when he created matter, and endued it with a principle of mobility, established certain rules for the perpetual direction of that motion; so, when he created man, and endued him with free-will to conduct himself in all parts of life, he laid down certain immutable laws of human nature, whereby that free-will is in some degree regulated and restrained, and gave him also the faculty of reason to discover the purport of those laws.

Considering the Creator only as a being of infinite power, he was able unquestionably to have prescribed whatever laws he pleased to his creature, man, however unjust or severe. But as he is also a Being of infinite wisdom, he has laid down only such laws as were founded in those relations of justice that existed in the nature of things antecedent to any positive precept. These are the eternal, immutable laws of good and evil, to which the Creator himself in all his dispensations conforms; and which he has enabled human reason to discover, so far as they are necessary for the conduct of human actions. Such, among others, are these principles: That we should live honestly, should hurt nobody, and should render to every one his due; to which three general precepts Justinian has reduced the whole doctrine of law.

But if the discovery of these first principles of the law of nature depended only upon the due exertion of right reason, and could not otherwise be obtained than by a chain of metaphysical disquisitions, mankind would have wanted some inducement to have quickened their inquiries, and the greater part of the world would have rested content in mental idleness, and ignorance its inseparable companion. As therefore the Creator is a being, not only of infinite power and wisdom, but also of infinite goodness, he has been pleased so to contrive the constitution and frame of humanity, that we should want no other prompter to inquire after and pursue the rule of right, but only our own self-love, that universal principle of action. For he has so intimately connected, so inseparably interwoven, the laws of eternal justice with the *happines*s of each individual, that the latter cannot be attained but by observing the former; and, if the former be punctually obeyed, it cannot but induce the latter. In consequence of which mutual connection of justice and human felicity, he has not perplexed the law of nature with a multitude of abstracted rules and precepts, referring merely to the fitness or unfitness of things, as some have vainly surmised; but has graciously reduced the rule of obedience to this one paternal precept, "that man should pursue his own happiness." This is the foundation of what we call *ethics*, or *natural law* \*. For the several articles, into which it is branched in our systems, amount to no more than demonstrating, that this or that action tends to man's real happiness; and therefore very justly concluding, that the performance of it is a part

Law of nature.

<sup>2</sup>

[ a ] of

Of Laws  
in generalOf Laws  
in general

of the law of nature; or, on the other hand, that this or that action is destructive of man's real happiness, and therefore that the law of nature forbids it.

This law of nature, being coeval with mankind, and dictated by God himself, is of course superior in obligation to any other. It is binding over all the globe, in all countries, and at all times: no human laws are of any validity, if contrary to this; and such of them as are valid derive all their force, and all their authority, mediately or immediately, from this original.

But in order to apply this to the particular exigencies of each individual, it is still necessary to have recourse to reason: whose office it is to discover, as was before observed, what the law of nature directs in every circumstance of life; by considering, what method will tend the most effectually to our own substantial happiness. And if our reason were always, as in our first ancestor before his transgression, clear and perfect, untroubled by passions, unclouded by prejudice, unimpaired by disease or intemperance, the task would be pleasant and easy; we should need no other guide but this. But every man now finds the contrary in his own experience; that his reason is corrupt, and his understanding full of ignorance and error.

This has given manifold occasion for the benign interposition of Divine Providence; which, in compassion to the frailty, the imperfection, and the blindness of human reason, hath been pleased, at sundry times and in divers manners, to discover and enforce its laws by an immediate and direct revelation. The doctrines thus delivered, we call the *revealed or divine law*, and they are to be found only in the Holy Scriptures. These precepts, when revealed, are found upon comparison to be really a part of the original law of nature, as they tend in all their consequences to man's felicity. But we are not from thence to conclude, that the knowledge of these truths was attainable by reason, in its present corrupted state; since we find, that, until they were revealed, they were hid from the wisdom of ages. As then the moral precepts of this law are indeed of the same original with those of the law of nature, so their intrinsic obligation is of equal strength and perpetuity. Yet undoubtedly the revealed law is of infinitely more authenticity than that moral system which is framed by ethical writers, and denominated the *natural law*: because one is the law of nature, expressly declared so to be by God himself; the other is only what, by the assistance of human reason, we imagine to be that law. If we could be as certain of the latter as we are of the former, both would have an equal authority: but, till then, they can never be put in any competition together.

Upon these two foundations, the law of nature and the law of revelation, depend all human laws; that is to say, no human laws should be suffered to contradict these. There are, it is true, a great number of indifferent points, in which both the divine law and the natural leave a man at his own liberty; but which are found necessary, for the benefit of society, to be restrained within certain limits. And herein it is that human laws have their greatest force and efficacy: for, with regard to such points as are not indifferent, human laws are only declaratory of, and act in subordination to, the former. To infringe in the case of murder: this is expressly forbidden by the divine, and demonstrably

by the natural law; and from these prohibitions arises the true unlawfulness of this crime. Those human laws, that annex a punishment to it, do not at all increase its moral guilt, or superadd any fresh obligation in *foro conscientie* to abstain from its perpetration. Nay, if any human law should allow or enjoin us to commit it, we are bound to transgress that human law, or else we must offend both the natural and the divine. But with regard to matters that are in themselves indifferent, and are not commanded or forbidden by those superior laws; such, for instance, as exporting of wool into foreign countries; here the inferior legislature has scope and opportunity to interpose, and to make that action unlawful which before was not so.

If man were to live in a state of nature, unconnected with other individuals, there would be no occasion for any other laws than the law of nature and the law of God. Neither could any other law possibly exist: for a law always supposes some superior who is to make it; and in a state of nature we are all equal, without any other superior but him who is the Author of our being. But man was formed for society; and, as is demonstrated by the writers on this subject, is neither capable of living alone, nor indeed has the courage to do it. However, as it is impossible for the whole race of mankind to be united in one great society, they must necessarily divide into many; and form separate states, commonwealths, and nations, entirely independent of each other, and yet liable to a mutual intercourse. Hence arises a third kind of law to regulate this mutual intercourse, called the *law of nations*: which, as none of these states will acknowledge a superiority in the other, cannot be dictated by either; but depends entirely upon the rules of natural law, or upon mutual compacts, treaties, leagues, and agreements, between these several communities: in the construction also of which compacts we have no other rule to resort to, but the law of nature; being the only one to which both communities are equally subject: and therefore the civil law very justly observes, that *quod naturalis ratio inter omnes homines constituit, vocatur jus gentium*.

To the consideration, then, of the law of nature, the revealed law, and the law of nations, succeeds that of the municipal or civil law; that is, the rule by which particular districts, communities, or nations are governed; being thus defined by Justinian, "*jus civile est quod quisque sibi populus constituit*." We call it *municipal law*, in compliance with common speech; for though, strictly, that expression denotes the particular customs of one single *municipium* or free town, yet it may with sufficient propriety be applied to any one state or nation which is governed by the same laws and customs.

Municipal law, thus understood, is properly defined to be "a rule of civil conduct prescribed by the supreme power in a state, commanding what is right and prohibiting what is wrong." Let us endeavour to explain its several properties, as they arise out of this definition.

And, first, it is a *rule*: not a transient sudden order from a superior to or concerning a particular person; but something permanent, uniform, and universal. Therefore a particular act of the legislature to confiscate the goods of Titius, or to attain him of high treason, does not enter into the idea of a municipal law:

for.

Law of re-  
velation.Law of  
nations.Municipal  
or civil law.

Defined.

Its first  
property.

for the operation of this act is spent upon Titius only, and has no relation to the community in general; it is rather a sentence, than a law. But an act to declare that the crime of which Titius is accused shall be deemed high treason; this has permanency, uniformity, and universality, and therefore is properly a rule. It is also called a rule, to distinguish it from *advice* or *counsel*, which we are at liberty to follow or not as we see proper, and to judge upon the reasonableness or unreasonableness of the thing advised: whereas our obedience to the law depends not upon our *approbation*, but upon the *Maker's will*. Counsel is only matter of persuasion, law is matter of injunction; counsel acts only upon the willing, law upon the unwilling also.

It is also called a rule, to distinguish it from a *compact* or *agreement*; for a compact is a promise proceeding from us, law is a command directed to us. The language of a compact is, "I will, or will not, do this;" that of a law is, "Thou shalt, or shalt not, do it." It is true there is an obligation which a compact carries with it, equal in point of conscience to that of a law; but then the original of the obligation is different. In compacts, we ourselves determine and promise what shall be done, before we are obliged to do it; in laws, we are obliged to act without ourselves determining or promising any thing at all. Upon these accounts law is defined to be "a rule."

9  
Second  
property.

Municipal law is also "a rule of civil conduct." This distinguishes municipal law from the natural, or revealed: the former of which is the rule of moral conduct; and the latter not only the rule of moral conduct, but also of faith. These regard man as a creature; and point out his duty to God, to himself, and to his neighbour, considered in the light of an individual. But municipal or civil law regards him also as a citizen, and bound to other duties towards his neighbour, than those of mere nature and religion: duties, which he has engaged in by enjoying the benefits of the common union; and which amount to no more, than that he do contribute, on his part, to the subsistence and peace of the society.

10  
Third  
property.

It is likewise "a rule prescribed." Because a bare resolution, confined in the breast of the legislator, without manifesting itself by some external sign, can never be properly a law. It is requisite that this resolution be notified to the people who are to obey it. But the manner in which this notification is to be made, is matter of very great indifference. It may be notified by universal tradition and long practice, which supposes a previous publication, and is the case of the common law of England and of Scotland. It may be notified *viva voce*, by officers appointed for that purpose; as is done with regard to proclamations, and such acts of parliament as are appointed to be publicly read in churches and other assemblies. It may, lastly, be notified by writing, printing, or the like; which is the general course taken with all our acts of parliament. Yet, whatever way is made use of, it is incumbent on the promulgators to do it in the most public and perspicuous manner; not like Caligula, who (according to Dio Cassius) wrote his laws in a very small character, and hung them up upon high pillars, the more effectually to ensnare the people. There is still a more unreasonable method than this, which is called making of laws *ex post facto*; when after an action (indifferent in itself) is committed,

the legislator then for the first time declares it to have been a crime, and inflicts a punishment upon the person who has committed it. Here it is impossible that the party could foresee, that an action, innocent when it was done, should be afterwards converted to guilt by a subsequent law: he had therefore no cause to abstain from it; and all punishment for not abstaining must of consequence be cruel and unjust. All laws should be therefore made to commence in *future*, and be notified before their commencement; which is implied in the term "prescribed." But when this rule is in the usual manner notified, or prescribed, it is then the subject's business to be thoroughly acquainted therewith; for if ignorance, of what he might know, were admitted as a legitimate excuse, the laws would be of no effect, but might always be eluded with impunity.

But further: Municipal law is "a rule of civil conduct prescribed by the supreme power in a state." For<sup>11</sup> Four<sup>th</sup> property: legislature, as was before observed, is the greatest act of superiority that can be exercised by one being over another. Wherefore it is requisite to the very essence of a law, that it be made by the supreme power. Sovereignty and legislature are indeed convertible terms; one cannot subsist without the other.

This will naturally lead us into a short inquiry concerning the nature of society and civil government; and the natural inherent right that belongs to the sovereignty of a state, wherever that sovereignty be lodged, of making and enforcing laws.

The only true and natural foundations of society are the wants and fears of individuals. Not that we can believe, with some theoretical writers, that there ever was a time when there was no such thing as society; and that, from the impulse of reason, and through a sense of their wants and weaknesses, individuals met together in a large plain, entered into an original contract, and chose the tallest man present to be their governor. This notion, of an actually existing unconnected state of nature, is too wild to be seriously admitted: and besides, it is plainly contradictory to the revealed accounts of the primitive origin of mankind, and their preservation 2000 years afterwards; both which were effected by the means of single families. These formed the first society, among themselves; which every day extended its limits; and when it grew too large to subsist with convenience in that pastoral state wherein the patriarchs appear to have lived, it necessarily subdivided itself by various migrations into more. Afterwards, as agriculture increased, which employs and can maintain a much greater number of hands, migrations became less frequent: and various tribes, which had formerly separated, reunited again; sometimes by compulsion and conquest, sometimes by accident, and sometimes perhaps by compact. But though society had not its formal beginning from any convention of individuals, actuated by their wants and their fears; yet it is the sense of their weakness and imperfection that keeps mankind together; that demonstrates the necessity of this union; and that therefore is the solid and natural foundation, as well as the cement, of society. And this is what we mean by the original contract of society; which, though perhaps in no instance it has ever been formally expressed at the first institution of a state, yet in nature and reason must always be understood and implied in the very act of associating

together: namely, that the whole should protect all its parts, and that every part should pay obedience to the will of the whole; or, in other words, that the community should guard the rights of each individual member, and that (in return for this protection) each individual should submit to the laws of the community; without which submission of all, it was impossible that protection could be certainly extended to any.

For when society is once formed, government results of course, as necessarily to preserve and to keep that society in order. Unless some superior be constituted, whose commands and decisions all the members are bound to obey, they would still remain as in a state of nature, without any judge upon earth to define their several rights, and redress their several wrongs. But, as all the members of society are naturally equal, it may be asked, In whose hands are the reins of government to be entrusted? To this the general answer is easy; but the application of it to particular cases has occasioned one half of those mischiefs which are apt to proceed from misguided political zeal. In general, all mankind will agree, that government should be reposed in such persons, in whom those qualities are most likely to be found, the perfection of which is among the attributes of him who is emphatically styled the *Supreme Being*; the three grand requisites, namely, of wisdom, of goodness, and of power: wisdom, to discern the real interest of the community; goodness, to endeavour always to pursue that real interest; and strength, or power, to carry this knowledge and intention into action. These are the natural foundations of sovereignty, and these are the requisites that ought to be found in every well constituted frame of government.

How the several forms of government we now see in the world at first actually began, is matter of great uncertainty, and has occasioned infinite disputes. It is not our business or intention to enter into any of them. However they began, or by what right soever they subsist, there is and must be in all of them a supreme, irresistible, absolute, uncontrolled authority, in which the *jura summi imperii*, or the rights of sovereignty, reside. And this authority is placed in those hands, wherein (according to the opinion of the founders of such respective states, either expressly given, or collected from their tacit approbation) the qualities requisite for supremacy, wisdom, goodness and power, are the most likely to be found.

The political writers of antiquity will not allow more than three regular forms of government: the first, when the sovereign power is lodged in an aggregate assembly consisting of all the members of a community, which is called a *democracy*; the second, when it is lodged in a council composed of select members, and then it is styled an *aristocracy*; the last, when it is entrusted in the hands of a single person, and then it takes the name of a *monarchy*. All other species of government, they say, are either corruptions of, or reducible to, these three.

By the sovereign power, as was before observed, is meant the making of laws; for wherever that power resides, all others must conform to and be directed by it, whatever appearance the outward form and administration of the government may put on. For it is at any time in the option of the legislature to alter that form and administration by a new edict or rule, and to

put the execution of the laws into whatever hands it pleases: and all the other powers of the state must obey the legislative power in the execution of their several functions, or else the constitution is at an end.

In a democracy, where the right of making laws resides in the people at large, public virtue, or goodness of intention, is more likely to be found, than either of the other qualities of government. Popular assemblies are frequently foolish in their contrivance, and weak in their execution; but generally mean to do the thing that is right and just, and have always a degree of patriotism or public spirit. In aristocracies there is more wisdom to be found than in the other forms of government; being composed, or intended to be composed, of the most experienced citizens: but there is less honesty than in a republic, and less strength than in a monarchy. A monarchy is indeed the most powerful of any, all the sinews of government being knit and united together in the hand of the prince; but then there is imminent danger of his employing that strength to improvident or oppressive purposes.

Thus these three species of government have, all of them, their several perfections and imperfections. Democracies are usually the best calculated to direct the end of a law; aristocracies, to invent the means by which that end shall be obtained; and monarchies, to carry those means into execution. And the ancients, as was observed, had in general no idea of any other permanent form of government but these three: for though Cicero declares himself of opinion, "*esse optime constitutam rempublicam, quæ ex tribus generibus illis, regali, optimo, et populari, sit modice confusa*," yet Tacitus treats this notion of a mixed government, formed out of them all, and partaking of the advantages of each, as a visionary whim, and one that, if effected, could never be lasting or secure.

But, happily for us of this island, the British constitution has long remained, and we trust will long continue, a standing exception to the truth of this observation. For, as with us the executive power of the laws is lodged in a single person, they have all the advantages of strength and dispatch that are to be found in the most absolute monarchy: and, as the legislature of the kingdom is entrusted to three distinct powers, entirely independent of each other; first, the king; secondly, the lords spiritual and temporal, which is an aristocratical assembly of persons selected for their piety, their birth, their wisdom, their valour, or their property; and, thirdly, the house of commons, freely chosen by the people from among themselves, which makes it a kind of democracy; as this aggregate body, actuated by different springs and attentive to different interests, composes the British parliament, and has the supreme disposal of every thing, there can no inconvenience be attempted by either of the three branches, but will be withstood by one of the other two, each branch being armed with a negative power sufficient to repel any innovation which it shall think inexpedient or dangerous.

Here, then, is lodged the sovereignty of the British constitution; and lodged as beneficially as is possible for society. For in no other shape could we be so certain of finding the three great qualities of government so well and so happily united. If the supreme power were lodged in any one of the three branches separately,

Of Laws  
in general.

rately, we must be exposed to the inconveniences of either absolute monarchy, aristocracy, or democracy; and so want two of the three principal ingredients of good polity, either virtue, wisdom, or power. If it were lodged in any two of the branches; for instance, in the king and house of lords; our laws might be providently made and well executed, but they might not always have the good of the people in view: if lodged in the king and commons, we should want that circumspection and meditative caution, which the wisdom of the peers is to afford: if the supreme rights of legislature were lodged in the two houses only, and the king had no negative upon their proceedings, they might be tempted to encroach upon the royal prerogative, or perhaps to abolish the kingly office, and thereby weaken (if not totally destroy) the strength of the executive power. But the constitutional government of this island is so admirably tempered and compounded, that nothing can endanger or hurt it, but destroying the equilibrium of power between one branch of the legislature and the rest. For if ever it should happen, that the independence of any one of the three should be lost, or that it should become subservient to the views of either of the other two, there would soon be an end of our constitution. The legislature would be changed from that which was originally set up by the general consent and fundamental act of the society: and such a change, however effected, is, according to Mr Locke, (who perhaps carries his theory too far), at once an entire dissolution of the bands of government; and the people are thereby reduced to a state of anarchy, with liberty to constitute to themselves a new legislative power.

Having thus cursorily considered the three usual species of government, and our own singular constitution selected and compounded from them all, we proceed to observe, that, as the power of making laws constitutes the supreme authority, so wherever the supreme authority in any state resides, it is the right of that authority to make laws: that is, in the words of our definition, *to prescribe the rule of civil action*. And this may be discovered from the very end and institution of civil states. For a state is a collective body, composed of a multitude of individuals, united for their safety and convenience, and intending to act together as one man. If it therefore is to act as one man, it ought to act by one uniform will. But, inasmuch as political communities are made up of many natural persons, each of whom has his particular will and inclination, these several wills cannot by any natural union be joined together, or tempered and disposed into a lasting harmony, so as to constitute and produce that one uniform will of the whole. It can therefore be no otherwise produced than by a political union; by the consent of all persons to submit their own private wills to the will of one man, or of one or more assemblies of men, to whom the supreme authority is entrusted; and this will of that one man, or assemblage of men, is in different states, according to their different constitutions, understood to be law.

Thus far as to the *right* of the supreme power to make laws: but farther, it is its *duty* likewise. For since the respective members are bound to conform themselves to the will of the state, it is expedient that they receive directions from the state declaratory of that its will. But as it is impossible, in so great a

multitude, to give injunctions to every particular man, relative to each particular action, therefore the state establishes general rules, for the perpetual information and direction of all persons in all points, whether of positive or negative duty. And this, in order that every man may know what to look upon as his own, what as another's; what absolute and what relative duties are required at his hands; what is to be esteemed honest, dishonest, or indifferent; what degree every man retains of his natural liberty, and what he has given up as the price of the benefits of society; and after what manner each person is to moderate the use and exercise of those rights which the state assigns him, in order to promote and secure the public tranquillity.

From what has been advanced, the truth of the former branch of our definition is (we trust) sufficiently evident; that "civil law is a rule of civil conduct, prescribed by the supreme power in a state." We proceed now to the latter branch of it; that it is a rule so prescribed, "commanding what is right, and prohibiting what is wrong."

Now, in order to do this completely, it is first of all necessary that the boundaries of right and wrong be established and ascertained by law. And when this is once done, it will follow of course, that it is likewise the business of the law, considered as a rule of civil conduct, to enforce these rights, and to restrain or redress these wrongs. It remains therefore only to consider, in what manner the law is said to ascertain the boundaries of right and wrong; and the methods which it takes to command the one and prohibit the other.

For this purpose, every law may be said to consist of several parts: one, declaratory: whereby the rights to be observed, and the wrongs to be eschewed, are clearly defined and laid down: another, directory; whereby the subject is instructed and enjoined to observe those rights, and to abstain from the commission of those wrongs; a third, remedial; whereby a method is pointed out to recover a man's private rights, or redress his private wrongs: to which may be added a fourth, usually termed the *sanction*, or *coercitory* branch, of the law; whereby it is signified what evil or penalty shall be incurred by such a commit any public wrongs, and transgress or neglect their duty.

With regard to the first of these, the *declaratory* part of the municipal law; this depends not so much upon the law of revelation or of nature, as upon the wisdom and will of the legislator. This doctrine, which before was slightly touched, deserves a more particular explication. Those rights, then, which God and nature have established, and are therefore called *natural rights*, such as are life and liberty, need not the aid of human laws to be more effectually invested in every man than they are; neither do they receive any additional strength when declared by the municipal laws to be inviolable. On the contrary, no human legislature has power to abridge or destroy them, unless the owner shall himself commit some act that amounts to a forfeiture. Neither do divine or natural *duties* (such as, for instance, the worship of God, the maintenance of children, and the like) receive any stronger sanction from being also declared to be duties by the law of the land. The case is the same as to crimes and misdemeanors, that are forbidden by the superior laws, and therefore styled *mala in se*, such as murder, theft, and perjury; which

Declaratory  
part of the  
law.

which contract no additional turpitude from being declared unlawful by the inferior legislature. For that legislation in all these cases acts only, as was before observed, in subordination to the Great Lawgiver, transcribing and publishing his precepts. So that, upon upon the whole, the declaratory part of the municipal law has no force or operation at all, with regard to actions that are naturally and intrinsically right or wrong.

But with regard to things in themselves indifferent, the case is entirely altered. These become either right or wrong, just or unjust, duties or misdemeanors, according as the municipal legislator sees proper, for promoting the welfare of the society, and more effectually carrying on the purposes of civil life. Thus our own common law has declared, that the goods of the wife do instantly upon marriage become the property and right of the husband; and our statute law has declared all monopolies a public offence: yet that right, and this offence, have no foundation in nature; but are merely created by the law, for the purposes of civil society. And sometimes, where the thing itself has its rise from the law of nature, the particular circumstances and mode of doing it become right or wrong, as the laws of the land shall direct. Thus, for instance, in civil duties; obedience to superiors is the doctrine of revealed as well as natural religion: but who those superiors shall be, and in what circumstances, or to what degrees they shall be obeyed, is the province of human laws to determine. And so, as to injuries or crimes, it must be left to our own legislature to decide, in what cases the seizing another's cattle shall amount to the crime of robbery; and where it shall be a justifiable action, as when a landlord takes them by way of distress for rent.

29  
Directory  
part.

Thus much for the declaratory part of the municipal law: and the *directory* stands much upon the same footing; for this virtually includes the former, the declaration being usually collected from the direction. The law that says, "Thou shalt not steal," implies a declaration that stealing is a crime. And we have seen, that, in things naturally indifferent, the very essence of right and wrong depends upon the direction of the laws to do or to omit them.

20  
Remedial  
part.

The *remedial* part of a law is so necessary a consequence of the former two, that laws must be very vague and imperfect without it. For in vain would rights be declared, in vain directed to be observed, if there were no method of recovering and asserting those rights when wrongfully withheld or invaded. This is what we mean properly, when we speak of the protection of the law. When, for instance, the declaratory part of the law has said, "that the field or inheritance, which belonged to Titius's father, is vested by his death in Titius;" and the directory part has "forbidden any one to enter on another's property, without the leave of the owner:" if Gaius after this will presume to take possession of the land, the remedial part of the law will then interpose its office; will make Gaius restore the possession to Titius, and also pay him damages for the invasion.

With regard to the sanction of laws, or the evil that may attend the breach of public duties; it is observed, that human legislators have for the most part chosen to make the sanction of their laws rather

vindictory than remuneratory, or to consist rather in punishments than in actual particular rewards: Because, in the first place, the quiet enjoyment and protection of all our civil rights and liberties, which are the sure and general consequence of obedience to the municipal law, are in themselves the best and most valuable of all rewards: because also, were the exercise of every virtue to be enforced by the proposal of particular rewards, it were impossible for any state to furnish stock enough for so profuse a bounty: and farther, because the dread of evil is a much more forcible principle of human actions than the prospect of good. For which reasons, though a prudent bestowing of rewards is sometimes of exquisite use, yet we find that those civil laws, which enforce and enjoin our duty, do seldom, if ever, propose any privilege or gift to such as obey the law; but do constantly come armed with a penalty denounced against transgressors, either expressly defining the nature and quantity of the punishment, or else leaving it to the discretion of the judges, and those who are entrusted with the care of putting the laws in execution.

Of all the parts of a law the most effectual is the *vindictory*. For it is but lost labour to say, "do this, or avoid that," unless we also declare, "this shall be the consequence of your non-compliance." We must therefore observe, that the main strength and force of a law consists in the penalty annexed to it. Herein is to be found the principal obligation of human laws. 27  
Vindictory part.

Legislators and their laws are said to *compel and oblige*: not that, by any natural violence, they constrain a man as to render it impossible for him to act otherwise than as they direct, which is the strict sense of obligation: but because, by declaring and exhibiting a penalty against offenders, they bring it to pass that no man can easily choose to transgress the law; since, by reason of the impending correction, compliance is in a high degree preferable to disobedience. And, even where rewards are proposed as well as punishments threatened, the obligation of the law seems chiefly to consist in the penalty: for rewards, in their nature, can only persuade and allure; nothing is compulsory but punishment.

It is true, it hath been holden, and very justly, by the principal of our ethical writers, that human laws are binding upon mens consciences. But if that were the only or most forcible obligation, the good only would regard the laws, and the bad would set them at defiance. And true, as this principle is, it must still be understood with some restriction. It holds, we apprehend, as to *rights*; and that, when the law has determined the field to belong to Titius, it is matter of conscience no longer to withhold or to invade it. So also in regard to *natural duties*, and such offences as are *mala in se*: here we are bound in conscience, because we are bound by superior laws, before those human laws were in being, to perform the one and abstain from the other. But in relation to those laws which enjoin only positive duties, and forbid only such things as are not *mala in se*, but *mala prohibita* merely, without any intermixture of moral guilt, annexing a penalty to non-compliance; here seems to be conscience no farther concerned, than by directing a submission to the penalty, in case of our breach of those laws: for otherwise the multitude of penal laws in a state would

would not only be looked upon as an impolitic, but would also be a very wicked, thing; if every such law were a snare for the conscience of the subject. But in these cases the alternative is offered to every man; "either abstain from this, or submit to such a penalty:" and his conscience will be clear, whichever side of the alternative he thinks proper to embrace. Thus, by the statutes for preserving the game, a penalty is denounced against every unqualified person that kills a hare, and against every person who possesses a partridge in August. And so too, by other statutes, pecuniary penalties are inflicted for exercising trades without serving an apprentice ship thereto, for erecting cottages without annexing four acres of land to each, for not burying the dead in woollen, for not performing statute-work on the public roads, and for innumerable other positive misdemeanors. Now these prohibitory laws do not make the transgression a moral offence, or sin; the only obligation in conscience is to submit to the penalty if levied. It must, however, be observed, that we are here speaking of laws that are simply and purely penal, where the thing forbidden or enjoined is wholly a matter of indifference, and where the penalty inflicted is an adequate compensation for the civil inconvenience supposed to arise from the offence. But where disobedience to the law involves in it also any degree of public mischief or private injury, there it falls within our former distinction, and is also an offence against conscience.

We have now gone through the definition laid down of a municipal law; and have shewn that it is "a rule--of civil conduct--prescribed--by the supreme power in a state--commanding what is right, and prohibiting what is wrong:" in the explication of which we have endeavoured to interweave a few useful principles, concerning the nature of civil government, and the obligation of human laws. Before we conclude this part, it may not be amiss to add a few observations concerning the interpretation of laws.

When any doubt arose upon the construction of the Roman laws, the usage was to state the case to the emperor in writing, and take his opinion upon it. This was certainly a bad method of interpretation. To interrogate the legislature to decide particular disputes, is not only endless, but affords great room for partiality and oppression. The answers of the emperor were called his rescripts, and these had in succeeding cases the force of perpetual laws; though they ought to be carefully distinguished, by every rational civilian, from those general constitutions which had only the nature of things for their guide. The emperor Marcellinus, as his historian Capitolinus informs us, had once resolved to abolish these rescripts, and retain only the general edicts: he could not bear that the hasty and crude answers of such princes as Commodus and Caracalla should be revered as laws. But Justinian thought otherwise, and he has preserved them all. In like manner the canon laws, or decretal epistles of the popes, are all of them rescripts in the strictest sense. Contrary to all true forms of reasoning, they argue from particulars to generals.

The fairest and most rational method to interpret the will of the legislator, is by exploring his intentions at the time when the law was made, by signs the most natural and probable. And these signs are either the

words, the context, the subject-matter, the effects and consequence, or the spirit and reason of the law. Let us take a short view of them all.

1. Words are generally to be understood in their usual and most known signification; not so much regarding the propriety of grammar, as their general and popular use. Thus the law mentioned by Puffendorf, which forbade a layman to lay hands on a priest, was adjudged to extend to him who had hurt a priest with a weapon. Again: Terms of art, or technical terms, must be taken according to the acceptance of the learned in each art, trade, and science. So in the act of settlement, where the crown of England is limited "to the princeess Sophia, and the heirs of her body being Protestants," it becomes necessary to call in the assistance of lawyers, to ascertain the precise idea of the words "heirs of her body;" which in a legal sense comprise only certain of her lineal descendants. Lastly, where words are clearly repugnant in two laws, the later law takes place of the elder; *leges posteriores priores contrarias abrogant*, is a maxim of universal law, as well as of our own constitutions. And accordingly it was laid down by a law of the twelve tables at Rome, *quod populus postremum jussit, id jus ratum esto*.

2. If words happen to be still dubious, we may establish their meaning from the context; with which it may be of singular use to compare a word or a sentence, whenever they are ambiguous, equivocal, or intricate. Thus the proëme, or preamble, is often called in to help the construction of an act of parliament. Of the same nature and use is the comparison of a law with other laws, that are made by the same legislator, that have some affinity with the subject, or that expressly relate to the same point. Thus, when the law of England declares murder to be felony without benefit of clergy, we must resort to the same law of England to learn what the benefit of clergy is: and, when the common law censures simoniacal contracts, it affords great light to the subject to consider what the canon law has adjudged to be simony.

3. As to the subject-matter, words are always to be understood as having a regard thereto; for that is always supposed to be in the eye of the legislator, and all his expressions directed to that end. Thus, when a law of Edward III. forbids all ecclesiastical persons to purchase provisions at Rome, it might seem to prohibit the buying of grain and other victual; but when we consider that the statute was made to repress the usurpations of the papal see, and that the nominations to benefices by the Pope were called *provisions*, we shall see that the restraint is intended to be laid upon such provisions only.

4. As to the effects and consequence, the rule is, That where words bear either none, or a very absurd signification, if literally understood, we must a little deviate from the received sense of them. Therefore the Bolognian law, mentioned by Puffendorf, which enacted "that whoever drew blood in the streets should be punished with the utmost severity," was held after long debate not to extend to the surgeon who opened the vein of a person that fell down in the street with a fit.

5. But, lastly, the most universal and effectual way of discovering the true meaning of a law, when the words

23  
Of the interpretation of laws.

23

24

25

26

27

words are dubious, is by considering the *reason* and *spirit* of it, or the cause which moved the legislator to enact it. For when this reason ceases, the law itself ought likewise to cease with it. An instance of this is given in a case put by Cicero, or whoever was the author of the rhetorical treatise inscribed to Herennius. There was a law, That those who in a storm forsook the ship should forfeit all property therein, and the ship and lading should belong entirely to those who staid in it. In a dangerous tempest, all the mariners forsook the ship, except only one sick passenger, who by reason of his disease was unable to get out and escape. By chance the ship came safe to port. The sick man kept possession, and claimed the benefit of the law. Now here all the learned agree, that the sick man is not within the reason of the law; for the reason of making it was, to give encouragement to such as should venture their lives to save the vessel: but this is a merit which he could never pretend to, who neither staid in the ship upon that account, nor contributed any thing to its preservation.

[38] 34  
Equity.

From this method of interpreting laws by the reason of them, arises what we call *equity*: which is thus defined by Grotius, "the correction of that, wherein the law (by reason of its universality) is deficient." For since in laws all cases cannot be foreseen or expressed, it is necessary, that, when the general decrees of the law come to be applied to particular cases, there should be somewhere a power vested of defining those circumstances, which (had they been foreseen) the legislator himself would have expressed. And these are the cases which, according to Grotius, "*lex non exakte definit, sed arbitrio boni viri permittit.*"

## PART II. THE LAW OF ENGLAND.

### INTRODUCTION.

THE municipal law of England, or the rule of civil conduct prescribed to the inhabitants of that kingdom, may with sufficient propriety be divided into two kinds: the *lex non scripta*, the unwritten or common law; and the *lex scripta*, the written or statute law.

The *lex non scripta*, or unwritten law, includes not only general customs, or the common law properly so called; but also the particular customs of certain parts of the kingdom, and likewise those particular laws that are by custom observed only in certain courts and jurisdictions.

In calling these parts of the law *leges non scriptæ*, we would not be understood as if all those laws were at present merely oral, or communicated from the former ages to the present solely by word of mouth. It is true indeed, that, in the profound ignorance of letters which formerly overspread the whole western world, all laws were entirely traditional; for this plain reason, that the nations among which they prevailed had but little idea of writing. Thus the British as well as the Gallic druids committed all their laws as well as learning to memory; and it is said of the primitive Saxons here, as well as their brethren on the continent, that *leges sola memoria et usu retinebant*. But, with us at present, the monuments and evidences of our legal cus-

Equity thus depending, essentially, upon the particular circumstances of each individual case, there can be no established rules and fixed precepts of equity laid down, without destroying its very essence, and reducing it to a positive law. And, on the other hand, the liberty of considering all cases in an equitable light, must not be indulged too far; lest thereby we destroy all law, and leave the decision of every question entirely in the breast of the judge. And law, without equity, tho' hard and disagreeable, is much more desirable for the public good, than equity without law; which would make every judge a legislator, and introduce most infinite confusion; as there would then be almost as many different rules of action laid down in our courts, as there are differences of capacity and sentiment in the human mind.

HAVING thus considered the nature of laws in general, we shall proceed to give a view of the particular laws of our own country; 1. Of England, 2. Of Scotland. The English law, however, being too extensive to admit of detail in a body, we can only here give such a sketch of it as may be sufficient to show the connection of its parts; but the principal of these parts themselves are explained at large, under their proper names, in the general alphabet.—A contrary method is followed with regard to the law of Scotland. This being less extensive, is given in a body, with all its parts not only in regular connection, but sufficiently explained; these parts, again, not being explained in the order of the alphabet, but marked with numerical references to their explanations in the system.

35  
Plan of the  
two follow-  
ing parts.

toms are contained in the records of the several courts of justice, in books of reports and judicial decisions, and in the treatises of learned sages of the profession, preserved and handed down to us from the times of highest antiquity. However, we therefore style these parts of our law *leges non scriptæ*, because their original institution and authority are not set down in writing, as acts of parliament are; but they receive their binding power, and the force of laws, by long and immemorial usage, and by their universal reception throughout the kingdom: in like manner as Aulus Gellius defines the *jus non scriptum* to be that, which is *tacite et illiterato hominum consensu et moribus expressum*.

Our ancient lawyers, and particularly Fortescue, insist with abundance of warmth, that these customs are as old as the primitive Britons, and continued down through the several mutations of government and inhabitants, to the present time, unchanged and unadulterated. This may be the case as to some. But in general, as Mr Selden in his notes observes, this assertion must be understood with many grains of allowance; and ought only to signify, as the truth seems to be, that there never was any formal exchange of one system of laws for another: though doubtless, by the intermixture of adventitious nations, the Romans, the Picts, the Saxons, the Danes, and the Normans, they must have insensibly introduced and incorporated many of their own customs with those that were before established; thereby, in all probability,

36  
Common  
law.

improving the texture and wisdom of the whole, by the accumulated wisdom of divers particular countries. Our laws, faith lord Bacon, are mixed as our language; and as our language is so much the richer, the laws are the more complete.

And indeed our antiquarians and first historians do all positively assure us, that our body of laws is of this compounded nature. For they tell us, that in the time of Alfred the local customs of the several provinces of the kingdom were grown so various, that he found it expedient to compile his dome-book, or *liber judicialis*, for the general use of the whole kingdom. This book is said to have been extant so late as the reign of Edward the fourth, but is now unfortunately lost. It contained, we may probably suppose, the principal maxims of the common law, the penalties for misdemeanours, and the forms of judicial proceedings. Thus much may at least be collected from that injunction to observe it, which we find in the laws of king Edward the elder, the son of Alfred. *Omnibus qui reipublice presunt etiam atque etiam mando, ut omnibus aequo se prebeant iudices, perinde ac in judiciali libro scriptum habetur: nec ququam formident quin jus commune audacter libereque dicant.*

But the irruption and establishment of the Danes in England, which followed soon after, introduced new customs, and caused this code of Alfred in many provinces to fall into disuse, or at least to be mixed and debased with other laws of a coarser alloy. So that, about the beginning of the 11<sup>th</sup> century, there were three principal systems of laws prevailing in different districts. 1. The *Mercen-Lage*, or Mercian laws, which were observed in many of the inland counties, and those bordering on the principality of Wales, the retreat of the ancient Britons; and therefore very probably intermixed with the British or Druidical customs. 2. The *West Saxon-Lage*, or laws of the West Saxons, which obtained in the counties to the south and west of the island, from Kent to Devonshire. These were probably much the same with the laws of Alfred above-mentioned, being the municipal law of the far most considerable part of his dominions, and particularly including Berkshire, the seat of his peculiar residence. 3. The *Dane-Lage*, or Danish law, the very name of which speaks its original and composition. This was principally maintained in the rest of the midland counties, and also on the eastern coast, the part most exposed to the visits of that piratical people. As for the very northern provinces, they were at that time under a distinct government.

Out of these three laws, Roger Hoveden and Ranulphus Cestrensis inform us, king Edward the confessor extracted one uniform law, or digest of laws, to be observed throughout the whole kingdom; though Hoveden and the author of an old manuscript chronicle assure us likewise, that this work was projected and begun by his grandfather king Edgar. And indeed a general digest of the same nature has been constantly found expedient, and therefore put in practice by other great nations, which were formed from an assemblage of little provinces, governed by peculiar customs. As in Portugal, under king Edward, about the beginning of the 15<sup>th</sup> century. In Spain, under Alonzo X. who about the year 1250 executed the plan of his father St Ferdinand, and collected all the provincial customs

into one uniform law, in the celebrated code entitled *las partidas*. And in Sweden, about the same era, a universal body of common law was compiled out of the particular customs established by the lagman of every province, and entitled the *land's lagh*, being analogous to the common law of England.

Both these undertakings, of king Edgar and Edward the confessor, seem to have been no more than a new edition, or fresh promulgation, of Alfred's code or dome-book, with such additions and improvements as the experience of a century and an half had suggested. For Alfred is generally styled by the same historians the *legum Anglicanarum conditor*, as Edward the confessor is the *restitutor*. These, however, are the laws which our histories so often mention under the name of the *laws of Edward the confessor*; which our ancestors struggled so hardly to maintain, under the first princes of the Norman line; and which subsequent princes so frequently promised to keep and to restore, as the most popular act they could do, when pressed by foreign emergencies or domestic discontents. These are the laws, that so vigorously withstood the repeated attacks of the civil law; which established in the 12<sup>th</sup> century a new Roman empire over most of the states on the continent: states that have lost, and perhaps upon that account, their political liberties; while the free constitution of England, perhaps upon the same account, has been rather improved than debased. These, in short, are the laws which gave rise and original to that collection of maxims and customs which is now known by the name of the *common law*. A name either given to it, in contradistinction to other laws, as the statute law, the civil law, the law merchant, and the like; or, more probably, as a law common to all the realm, the *jus commune* or *folcright* mentioned by king Edward the elder, after the abolition of the several provincial customs and particular laws before-mentioned.

But though this is the most likely foundation of this collection of maxims and customs; yet the maxims and customs, so collected, are of higher antiquity than memory or history can reach: nothing being more difficult than to ascertain the precise beginning and first spring of an ancient and long-established custom. Whence it is that in our law the goodness of a custom depends upon its having been used time out of mind; or, in the solemnity of our legal phrase, time whereof the memory of man runneth not to the contrary. This it is that gives it its weight and authority; and of this nature are the maxims and customs which compose the common law, or *lex non scripta*, of this kingdom.

This unwritten, or common law, is properly distinguishable into three kinds: 1. General customs; which are the universal rule of the whole kingdom, and form the common law in its stricter and more usual signification. 2. Particular customs; which for the most part affect only the inhabitants of particular districts. 3. Certain particular laws; which by custom are adopted and used by some particular courts, of pretty general and extensive jurisdiction.

1. As to general customs, or the common law properly so called; this is that law, by which proceedings and determinations in the king's ordinary courts of justice are guided and directed. This, for the most part, settles the course in which lands descend by inheritance;

[ b ]

of the un-  
written law:  
General  
customs.

heritance; the manner and form of acquiring and transferring property; the solemnities and obligation of contracts; the rules of expounding wills, deeds, and acts of parliament; the respective remedies of civil injuries; the several species of temporal offences, with the manner and degree of punishment; and an infinite number of minuter particulars, which diffuse themselves as extensively as the ordinary distribution of common justice requires. Thus, for example, that there shall be four superior courts of record, the chancery, the king's bench, the common pleas, and the exchequer;---that the eldest son alone is heir to his ancestor;---that property may be acquired and transferred by writing;---that a deed is of no validity unless sealed and delivered;---that wills shall be construed more favourably, and deeds more strictly;---that money lent upon bond is recoverable by action of debt;---that breaking the public peace is an offence, and punishable by fine and imprisonment;---all these are doctrines that are not set down in any written statute or ordinance; but depend merely upon immemorial usage, that is, upon common law, for their support.

Some have divided the common law into two principal grounds or foundations: 1. Established customs; such as that, where there are three brothers, the eldest brother shall be heir to the second, in exclusion of the youngest: and, 2. Established rules and maxims; as, "that the king can do no wrong, that no man shall be bound to accuse himself," and the like. But these seem to be one and the same thing. For the authority of these maxims rests entirely upon general reception and usage; and the only method of proving that this or that maxim is a rule of the common law, is by shewing that it hath been always the custom to observe it.

But here a very natural, and very material, question arises: How are these customs or maxims to be known, and by whom is their validity to be determined? The answer is, By the judges in the several courts of justice. They are the depositary of the laws; the living oracles who must decide in all cases of doubt, and who are bound by an oath to decide according to the law of the land. Their knowledge of that law is derived from experience and study; from the *viginti annorum lucubrations*, which Fortescue mentions; and from being long personally accustomed to the judicial decisions of their predecessors. And indeed these judicial decisions are the principal and most authoritative evidence, that can be given, of the existence of such a custom as shall form a part of the common law. The judgment itself, and all the proceedings previous thereto, are carefully registered and preserved under the name of *records*, in public repositories set apart for that particular purpose; and to them frequent recourse is had, when any critical question arises, in the determination of which former precedents may give light or assistance. And therefore, even so early as the conquest, we find the *præteritorum memoria eventorum* reckoned up as one of the chief qualifications of those who were held to be *legibus patriæ optime instituti*. For it is an established rule, To abide by former precedents, where the same points come again in litigation: as well to keep the scale of justice even and steady, and not liable to waver with every new judge's opinion; as also because the law in that case being solemnly declared and determined, what before was uncertain, and perhaps indifferent, is

now become a permanent rule, which it is not in the breast of any subsequent judge to alter or vary from according to his private sentiments: he being sworn to determine, not according to his own private judgment, but according to the known laws and customs of the land; not delegated to pronounce a new law, but to maintain and expound the old one. Yet this rule admits of exception, where the former determination is most evidently contrary to reason; much more if it be contrary to the divine law. But, even in such cases, the subsequent judges do not pretend to make a new law, but to vindicate the old one from misrepresentation. For if it be found that the former decision is manifestly absurd or unjust, it is declared, not that such a sentence was bad law, but that it was not law; that is, that it is not the established custom of the realm, as has been erroneously determined. And hence it is that our lawyers are with justice so copious in their encomiums on the reason of the common law: that they tell us, that the law is the perfection of reason, that it always intends to conform thereto, and that what is not reason is not law. Not that the particular reason of every rule in the law can at this distance of time be always precisely assigned; but it is sufficient that there be nothing in the rule flatly contradictory to reason, and then the law will presume it to be well founded. And it hath been an ancient observation in the laws of England, that whenever a standing rule of law, of which the reason perhaps could not be remembered or discerned, hath been wantonly broke in upon by statutes or new resolutions, the wisdom of the rule hath in the end appeared from the inconveniences that have followed the innovation.

The doctrine of the law then is this: That precedents and rules must be followed, unless flatly absurd or unjust: for though their reason be not obvious at first view, yet we owe such a deference to former times, as not to suppose they acted wholly without consideration. To illustrate this doctrine by examples. It has been determined, time out of mind, that a brother of the half blood shall never succeed as heir to the estate of his half brother, but it shall rather cleave to the king, or other superior lord. Now this is a positive law, fixed and established by custom; which custom is evidenced by judicial decisions; and therefore can never be departed from by any modern judge without a breach of his oath and the law. For herein there is nothing repugnant to natural justice; though the artificial reason of it, drawn from the feudal law, may not be quite obvious to every body. And therefore, on account of a supposed hardship upon the half brother, a modern judge might with it had been otherwise settled; yet it is not in his power to alter it. But if any court were now to determine, that an elder brother of the half blood might enter upon and seize any lands that were purchased by his younger brother, no subsequent judges would scruple to declare that such prior determination was unjust, was unreasonable, and therefore was not law. So that, the law, and the opinion of the judge, are not always convertible terms, or one and the same thing; since it sometimes may happen that the judge may mistake the law. Upon the whole, however, we may take it as a general rule, "That the decisions of courts of justice are the evidence of what is common law;" in the same manner as, in the civil law,

law, what the emperor had once determined was to serve for a guide for the future.

The decisions therefore of courts are held in the highest regard, and are not only preserved as authentic records in the treasuries of the several courts, but are handed out to public view in the numerous volumes of reports which furnish the lawyer's library. These reports are histories of the several cases, with a short summary of the proceedings, which are preserved at large in the record; the arguments on both sides, and the reasons the court gave for its judgment; taken down in short notes by persons present at the determination. And these serve as indexes to, and also to explain, the records; which always, in matters of consequence and nicety, the judges direct to be searched. The reports are extant in a regular series from the reign of king Edward the second inclusive; and from his time to that of Henry the eighth were taken by the prothonotaries, or chief scribes of the court, at the expense of the crown, and published annually, whence they are known under the denomination of the *year-books*. And it is much to be wished that this beneficial custom had, under proper regulations, been continued to this day: for, though king James the first, at the instance of lord Bacon, appointed two reporters with a handsome stipend, for this purpose; yet that wise institution was soon neglected, and from the reign of Henry the eighth to the present time this task has been executed by many private and cotemporary hands; who sometimes through haste and inaccuracy, sometimes through mistake and want of skill, have published very crude and imperfect (perhaps contradictory) accounts of one and the same determination. Some of the most valuable of the ancient reports are those published by lord chief justice Coke; a man of infinite learning in his profession, though not a little infected with the pedantry and quaintness of the times he lived in, which appear strongly in all his works. However, his writings are so highly esteemed, that they are generally cited without the author's name (A).

Besides these reporters, there are also other authors, to whom great veneration and respect are paid by the students of the common law. Such are Glanvil and Bracton, Britton and Fleta, Littleton and Fitzherbert, with some others of ancient date, whose treatises are cited as authority; and are evidence that cases have formerly happened in which such and such points were determined, which are now become settled and first principles. One of the last of these methodical writers in point of time, whose works are of any intrinsic authority in the courts of justice, and do not entirely depend on the strength of their quotations from older authors, is the same learned judge we have just mentioned, Sir Edward Coke; who hath written four volumes of Institutes, as he is pleased to call them, though they have little of the institutional method to warrant

such a title. The first volume is a very extensive comment upon a little excellent treatise of tenures, compiled by judge Littleton in the reign of Edward the fourth. This comment is a rich mine of valuable common-law learning, collected and heaped together from the ancient reports and year-books, but greatly defective in method (B). The second volume is a comment upon many old acts of parliament, without any systematical order; the third a more methodical treatise of the pleas of the crown; and the fourth an account of the several species of courts (C).

And thus much for the first ground and chief cornerstone of the laws of England; which is general immemorial custom, or common law, from time to time declared in the decisions of the courts of justice; which decisions are preserved among the public records, explained in the reports, and digested for general use in the authoritative writings of the venerable sages of the law.

The Roman law, as practised in the times of its liberty, paid also a great regard to custom; but not so much as our law: it only then adopting it, when the written law was deficient. Though the reasons alleged in the digest will fully justify our practice, in making it of equal authority with, when it is not contradicted by, the written law. "For since (says Julianus) the written law binds us for no other reason but because it is approved by the judgment of the people, therefore those laws which the people have approved without writing ought also to bind every body. For where is the difference, whether the people declare their assent to a law by suffrage, or by a uniform course of acting accordingly?" Thus did they reason while Rome had some remains of her freedom; but, when the imperial tyranny came to be fully established, the civil laws speak a very different language. *Quid principi placuit legis habet vigorem, cum populus ei et in eum omne suum imperium et potestatem conferat*, says Ulpian. *Imperator solus et conditor et interpres legis existimatur*, says the code. And again, *Sacrillegi insulari rescripto principis obviari*. And indeed it is one of the characteristic marks of British liberty, that the common law depends upon custom; which carries this internal evidence of freedom along with it, that it probably was introduced by the voluntary consent of the people.

II. The second branch of the unwritten laws of England are particular customs, or laws which affect only the inhabitants of particular districts.

These particular customs, or some of them, are without doubt the remains of that multitude of local customs before-mentioned, out of which the common law, as it now stands, was collected at first by king Alfred, and afterwards by king Edgar and Edward the confessor: each district mutually sacrificing some of its own special usages, in order that the whole kingdom

might

(A) His reports, for instance, are styled *cas' reportz*, "the reports;" and in quoting them we usually say, 1 or 2 Rep. not 1 or 2 Coke's Rep. as in citing other authors. The reports of judge Croke are also cited in a peculiar manner, by the name of those princes in whose reigns the cases reported in his three volumes were determined; viz. queen Elizabeth, king James, and king Charles the first; as well as by the number of each volume. For sometimes we call them 1, 2, and 3 Cro.; but more commonly Cro. Eliz. Cro. Jac. and Cro. Car.

(B) It is usually cited either by the name of Co. Litt. or as 1 Inst.

(C) These are cited as 2, 3, or 4 Inst. without any author's name. An honorary distinction, which, we observed, is paid to the works of no other writer; the generality of reports and other tracts being quoted in the name of the compiler, as 2 Ventris, 4 Leonard, 1 Siderfin, and the like.

4\*  
Second branch of the unwritten laws: Particular customs.

Law of  
England.

might enjoy the benefit of one uniform and universal system of laws. But, for reasons that have been now long forgotten, particular counties, cities, towns, manors, and lordships, were very early indulged with the privilege of abiding by their own customs, in contradistinction to the rest of the nation at large: which privilege is confirmed to them by several acts of parliament.

Such is the custom of gavelkind in Kent and some other parts of the kingdom (though perhaps it was also general till the Norman conquest); which ordains, among other things, that not the eldest son only of the father shall succeed to his inheritance, but all the sons alike; and that, though the ancestor be attainted and hanged, yet the heir shall succeed to his estate, without any escheat to the lord.---Such is the custom that prevails in divers ancient boroughs, and therefore called *borough-english*, that the youngest son shall inherit the estate, in preference to all his elder brothers.---Such is the custom in other boroughs, that a widow shall be intitled, for her dowry, to all her husband's lands; whereas at the common law she shall be endowed of one third part only.---Such also are the special and particular customs of manors, of which every one has more or less, and which bind all the copyhold tenants that hold of the said manors.---Such likewise is the custom of holding divers inferior courts, with power of trying causes, in cities and trading towns; the right of holding which, when no royal grant can be shewn, depends entirely upon immemorial and established usage.---Such, lastly, are many particular customs within the city of London, with regard to trade, apprentices, widows, orphans, and a variety of other matters. All these are contrary to the general law of the land, and are good only by special usage; though the customs of London are also confirmed by act of parliament.

To this head may most properly be referred a particular system of customs used only among one set of the king's subjects, called the *custom of merchants*, or *lex mercatoria*: which, however different from the general rules of the common law, is yet ingrafted into it, and made a part of it; being allowed, for the benefit of trade, to be of the utmost validity in all commercial transactions; for it is a maxim of law, that *cuiuslibet in sua arte credendum est*.

The rules relating to particular customs regard either the *proof* of their existence; their *legality* when proved; or their usual method of *allowance*. And first we will consider the rules of *proof*.

As to gavelkind, and borough-english, the law takes particular notice of them; and there is no occasion to prove, that such customs actually exist, but only that the lands in question are subject thereto. All other private customs must be particularly pleaded; and as well the existence of such customs must be shewn, as that the thing in dispute is within the custom alleged. The trial in both cases (both to shew the existence of the custom, as, "that in the manor of Dale lands shall descend only to the heirs male, and never to the heirs female;" and also to shew "that the lands in question are within that manor") is by a jury of 12 men, and not by the judges; except the same particular custom has been before tried, determined, and recorded, in the same court.

Law of  
England.

The customs of London differ from all others in point of trial: for, if the existence of the custom be brought in question, it shall not be tried by a jury, but by certificate from the lord mayor and aldermen by the mouth of their recorder; unless it be such a custom as the corporation is itself interested in, as a right of taking toll, &c. for then the law permits them not to certify on their own behalf.

When a custom is actually proved to exist, the next inquiry is into the *legality* of it; for, if it is not a good custom, it ought to be no longer used. *Malus usus abolendus est*, is an established maxim of the law. To make a particular custom good, the following are necessary requisites.

1. That it have been used so long, that the memory of man runneth not to the contrary. So that, if any one can shew the beginning of it, it is no good custom. For which reason, no custom can prevail against an express act of parliament; since the statute itself is a proof of a time when such a custom did not exist.

2. It must have been *continued*. Any interruption would cause a temporary ceasing: the revival gives it a new beginning, which will be within time of memory, and thereupon the custom will be void. But this must be understood with regard to an interruption of the right; for an interruption of the possession only, for 10 or 20 years, will not destroy the custom. As if the inhabitants of a parish have a customary right of watering their cattle at a certain pool, the custom is not destroyed though they do not use it for 10 years; it only becomes more difficult to prove; but if the right be any how discontinued for a day, the custom is quite at an end.

3. It must have been *peaceable*, and acquiesced in; not subject to contention and dispute. For as customs owe their original to common consent, their being immemorably disputed, either at law or otherwise, is a proof that such consent was wanting.

4. Customs must be *reasonable*; or rather, taken negatively, they must not be unreasonable. Which is not always, as Sir Edward Coke says, to be understood of every unlearned man's reason; but of artificial and legal reason, warranted by authority of law. Upon which account a custom may be good, though the particular reason of it cannot be assigned; for it sufficeth, if no good legal reason can be assigned against it. Thus a custom in a parish, that no man shall put his beasts into the common till the third of October, would be good; and yet it would be hard to shew the reason why that day in particular is fixed upon, rather than the day before or after. But a custom, that no cattle shall be put in till the lord of the manor has first put in his, is unreasonable, and therefore bad: for peradventure the lord will never put in his; and then the tenants will lose all their profits.

5. Customs ought to be *certain*. A custom, that lands shall descend to the most worthy of the owner's blood, is void; for how shall this worth be determined? but a custom to descend to the next male of the blood exclusive of females, is certain, and therefore good. A custom to pay two pence an acre in lieu of tithes, is good; but to pay sometimes two pence and sometimes three pence, as the occupier of the land pleases, is bad for its uncertainty. Yet a custom, to pay a year's improved value for a fine on a copyhold estate, is good; though

though the value is a thing uncertain: for the value may at any time be ascertained; and the maxim of law is, *Id certum est, quod certum reddi potest*.

6. Customs, though established by consent, must be (when established) *compulsory*: and not left to the option of every man, whether he will use them or no. Therefore a custom, that all the inhabitants shall be rated toward the maintenance of a bridge, will be good; but a custom, that every man is to contribute thereto at his own pleasure, is idle and absurd, and indeed no custom at all.

7. Lastly, customs must be *consistent* with each other. One custom cannot be set up in opposition to another. For if both are really customs, then both are of equal antiquity, and both established by mutual consent: which to say of contradictory customs, is absurd. Therefore, if one man prescribes that by custom he has a right to have windows looking into another's garden; the other cannot claim a right by custom to stop up or obstruct those windows: for these two contradictory customs cannot both be good, nor both stand together. He ought rather to deny the existence of the former custom.

Next, as to the *allowance* of special customs. Customs, in derogation of the common law, must be construed strictly. Thus, by the custom of gavelkind, an infant of 15 years may by one species of conveyance (called a *deed of feoffment*) convey away his lands in fee simple, or for ever. Yet this custom does not empower him to use any other conveyance, or even to lease them for seven years: for the custom must be strictly pursued. And, moreover, all special customs must submit to the king's prerogative. Therefore, if the king purchases lands of the nature of gavelkind, where all the sons inherit equally; yet, upon the king's demise, his eldest son shall succeed to those lands alone. And thus much for the second part of the *leges non scriptæ*, or those particular customs which affect particular persons or districts only.

III. The third branch of them are those peculiar laws which by custom are adopted and used only in certain peculiar courts and jurisdictions. And by these are understood the civil and canon laws.

It may seem a little improper, at first view, to rank these laws under the head of *leges non scriptæ*, or unwritten laws, seeing they are set forth by authority in their pandects, their codes, and their institutions; their councils, decrees, and decretals; and enforced by an immense number of expositions, decisions, and treatises of the learned in both branches of the law. But this is done after the example of Sir Matthew Hale, because it is most plain, that it is not on account of their being written laws, that either the canon law, or the civil law, have any obligation within this kingdom: neither do their force and efficacy depend upon their own intrinsic authority; which is the case of our written laws or acts of parliament. They bind not the subjects of England, because their materials were collected from popes or emperors; were digested by Justinian, or declared to be authentic by Gregory. These considerations give them no authority here: for the legislature of England doth not, nor ever did, recognize any foreign power, as superior or equal to it in this kingdom; or as having the right to give law to any, the meanest, of its subjects. But all the strength that either the pa-

pal or imperial laws have obtained in this realm (or indeed in any other kingdom in Europe) is only because they have been admitted and received by immemorial usage and custom in some particular cases, and some particular courts; and then they form a branch of the *leges non scriptæ*, or customary law: or else, because they are in some other cases introduced by consent of parliament, and then they owe their validity to the *leges scriptæ*, or statute law. This is expressly declared in those remarkable words of the statute 25 Hen. VIII. c. 21. addressed to the king's royal majesty.---“This your grace's realm, recognizing no superior under God but only your grace, hath been and is free from subjection to any man's laws, but only to such as have been devised, made, and ordained within this realm for the wealth of the same; or to such other as, by sufficiency of your grace and your progenitors, the people of this your realm have taken at their free liberty, by their own consent, to be used among them; and have bound themselves by long use and custom to the observance of the same: not as to the observance of the laws of any foreign prince, potentate, or prelate; but as to the custom and ancient laws of this realm, originally established as laws of the same, by the said sufficiency, consents, and custom; and none otherwise.”

1. By the civil law, absolutely taken, is generally understood the civil or municipal law of the Roman empire, as comprised in the institutes, the code, and the digest of the emperor Justinian, and the novel constitutions of himself and some of his successors; of which it may not be amiss to give a short and general account.

The Roman law (founded first upon the regal constitutions of their ancient kings, next upon the 12 tables of the decemviri, then upon the laws or statutes enacted by the senate or people, the edicts of the prætor, and the *responsa prudentum* or opinions of learned lawyers, and lastly upon the imperial decrees or constitutions of successive emperors) had grown to so great a bulk, or, as Livy expresses it, *tan immensus aliarum super alias accervatarum legum cumulus*, that they were computed to be many camels load by an author who preceded Justinian. This was in part remedied by the collections of three private lawyers, Gregorius, Hermogenes, and Papirius; and then by the emperor Theodosius the younger, by whose orders a code was compiled, A. D. 438, being a methodical collection of all the imperial constitutions then in force: which Theodosian code was the only book of civil law received as authentic in the western part of Europe, till many centuries after; and to this it is probable that the Franks and Goths might frequently pay some regard, in framing legal constitutions for their newly erected kingdoms. For Justinian commanded only in the eastern remains of the empire; and it was under his auspices, that the present body of civil law was compiled and finished by Tribonian and other lawyers, about the year 529.

This consists of, 1. The institutes; which contain the elements or first principles of the Roman law, in four books. 2. The digests or pandects, in 50 books; containing the opinions and writings of eminent lawyers, digested in a systematical method. 3. A new code, or collection of imperial constitutions; the lapse

Civil law.

44

of.

42  
Third  
branch of  
the unwritten  
laws.

of a whole century having rendered the former code of Theodosius imperfect. 4. The novels, or new constitutions, posterior in time to the other books, and amounting to a supplement to the code; containing new decrees of successful emperors, as new questions happened to arise. These form the body of Roman law, or *corpus juris civilis*, as published about the time of Justinian; which, however, fell soon into neglect and oblivion, till about the year 1190, when a copy of the digest was found at Amalfi in Italy; which accident, concurring with the policy of the Roman ecclesiastics, suddenly gave new vogue and authority to the civil law, introduced it into several nations, and occasioned that mighty inundation of voluminous comments, with which this system of law, more than any other, is now loaded.

2. The canon law is a body of Roman ecclesiastical law, relative to such matters as that church either has, or pretends to have, the proper jurisdiction over. This is compiled from the opinions of the ancient Latin fathers, the decrees of general councils, the decretal epistles and bulles of the holy see. All which lay in the same disorder and confusion as the Roman civil law: till, about the year 1151, one Gratian an Italian monk, animated by the discovery of Justinian's pandects, reduced the ecclesiastical constitutions also into some method, in three books; which he entitled *Concordia discordantium canonum*, but which are generally known by the name of *Decretum Gratiani*. These reached as low as the time of pope Alexander III. The subsequent papal decrees, to the pontificate of Gregory IX. were published in much the same method under the auspices of that pope, about the year 1230, in five books; entitled *Decretalia Gregorii noni*. A sixth book was added by Boniface VIII. about the year 1298, which is called *Sextus Decretalium*. The Clementine constitutions, or decrees of Clement V. were in like manner authenticated in 1317 by his successor John XXII.; who also published 20 constitutions of his own, called the *Extravagantes Joannis*: all which in some measure answer to the novels of the civil law. To these have been since added some decrees of later popes in five books, called *Extravagantes Communes*. And all these together, Gratian's decree, Gregory's decretals, the sixth decretal, the Clementine constitutions, and the extravagants of John and his successors, form the *corpus juris canonici*, or body of the Roman canon law.

Besides these pontifical collections, which during the times of popery were received as authentic in this island, as well as in other parts of Christendom, there is also a kind of national canon law, composed of legatine and provincial constitutions, and adapted only to the exigencies of this church and kingdom. The legatine constitutions were ecclesiastical laws, enacted in national synods, held under the cardinals Otho and Othobon, legates from pope Gregory IX. and pope Clement IV. in the reign of king Henry III. about the years 1220 and 1268. The provincial constitutions are principally the decrees of provincial synods, held under divers archbishops of Canterbury, from Stephen Langton in the reign of Henry III. to Henry Chichele in the reign of Henry V.; and adopted also by the province of York in the reign of Henry VI. At the dawn of the reformation, in the reign of king

Henry VIII. it was enacted in parliament, that a review should be had of the canon law; and till such review should be made, all canons, constitutions, ordinances and synodals provincial, being then already made, and not repugnant to the law of the land or the king's prerogative, should still be used and executed. And, as no such review has yet been perfected, upon this statute now depends the authority of the canon law in England.

As for the canons enacted by the clergy under James I. in the year 1603, and never confirmed in parliament, it has been solemnly adjudged upon the principles of law and the constitution, that where they are not merely declaratory of the ancient canon law, but are introductory of new regulations, they do not bind the laity, whatever regard the clergy may think proper to pay them.

There are four species of courts, in which the civil and canon laws are permitted under different restrictions to be used. 1. The courts of the archbishops and bishops, and their derivative officers; usually called *courts Christian*, (*curie Christianitatis*), or the *ecclesiastical courts*. 2. The military courts. 3. The courts of admiralty. 4. The courts of the two universities. In all, their reception in general, and the different degrees of that reception, are grounded entirely upon custom; corroborated in the latter instance by act of parliament, ratifying those charters which confirm the customary law of the universities. The more minute consideration of them will fall under their proper articles. It will suffice at present to remark a few particulars relative to them all, which may serve to inculcate more strongly the doctrine laid down concerning them.

1. And first, the courts of common law have the superintendency over these courts; to keep them within their jurisdictions; to determine wherein they exceed them; to restrain and prohibit such excess; and (in case of contumacy) to punish the officer who executes, and in some cases the judge who enforces, the sentence so declared to be illegal.

2. The common law has reserved to itself the exposition of all such acts of parliament, as concern either the extent of these courts, or the matters depending before them. And therefore, if these courts either refuse to allow these acts of parliament, or will expound them in any other sense than what the common law puts upon them, the king's courts at Westminster will grant prohibitions to restrain and control them.

3. An appeal lies from all these courts to the king, in the last resort; which proves that the jurisdiction exercised in them is derived from the crown of England, and not from any foreign potentate, or intrinsic authority of their own.---And, from these three strong marks and ensigns of superiority, it appears beyond a doubt, that the civil and canon laws, though admitted in some cases by custom in some courts, are only subordinate and *leges sub graviore lege*; and that thus admitted, restrained, altered, new-modelled, and amended, they are by no means with us a distinct independent species of laws, but are inferior branches of the customary or unwritten laws of England, properly called the *king's ecclesiastical*, the *king's military*, the *king's maritime*, or the *king's academical*, laws.

Let us next proceed to the *leges scripte*, the written laws

Law of England.

Law of England.

47  
The written  
laws.

laws of the kingdom; which are statutes, acts, or edicts, made by the king's majesty, by and with the advice of the lords spiritual and temporal and commons in parliament assembled. The oldest of these now extant, and printed in our statute books, is the famous *magna carta*, as confirmed in parliament 9 Hen. III. though doubtless there were many acts before that time, the records of which are now lost, and the determinations of them perhaps at present currently received for the maxims of the old common law.

The manner of making these statutes being explained under the articles BILL and PARLIAMENT, we shall here only take notice of the different kinds of statutes; and of some general rules with regard to their construction (p).

48  
Kinds of  
statutes.

First, as to their several kinds. Statutes are either *general* or *special*, public or private. A general or public act is an universal rule that regards the whole community: and of this the courts of law are bound to take notice judicially and *ex officio*, without the statute being particularly pleaded, or formally set forth, by the party who claims an advantage under it. Special or private acts are rather exceptions than rules, being those which only operate upon particular persons and private concerns; such as the Romans entitled *senatus-decreta*, in contradistinction to the *senatus-consulta*, which regarded the whole community; and of these the judges are not bound to take notice, unless they be formally shewn and pleaded. Thus, to shew the distinction, the statute 13 Eliz. c. 10. to prevent spiritual persons from making leases for longer terms than 21 years or three lives, is a public act; it being a rule prescribed to the whole body of spiritual persons in the nation: but an act to enable the bishop of Chester to make a lease to A. B. for 60 years, is an exception to this rule; it concerns only the parties and the bishop's successors, and is therefore a private act.

Statutes also are either *declaratory* of the common law, or *remedial* of some defects therein. Declaratory, where the old custom of the kingdom is almost fallen into disuse, or become disputable; in which case the parliament has thought proper, *in perpetuum rei testimonium*, and for avoiding all doubts and difficulties, to declare what the common law is and ever hath been. Thus the statute of treasons, 25 Edw. III. cap. 2. doth not make any new species of treasons; but only, for the benefit of the subject, declares and enumerates those several kinds of offence which before were treason at the common law. Remedial statutes are those which are made to supply such defects, and abridge such superfluities, in the common law, as arise either from the general imperfection of all human laws, from

change of time and circumstances, from the mistakes and unadvised determinations of unlearned judges, or from any other cause whatsoever. And this being done, either by enlarging the common law where it was too narrow and circumscribed, or by restraining it where it was too lax and luxuriant, hath occasioned another subordinate division of remedial acts of parliament into *enlarging* and *restraining* statutes. To instance again in the case of treason. Clipping the current coin of the kingdom was an offence not sufficiently guarded against by the common law: therefore it was thought expedient by statute 5 Eliz. c. 11. to make it high treason, which it was not at the common law: so that this was an *enlarging* statute. At common law, also, spiritual corporations might lease out their estates for any term of years, till prevented by the statute 13 Eliz. before-mentioned: this was therefore a *restraining* statute.

Secondly, the rules to be observed with regard to the construction of statutes are principally these which follow.

49  
Construction  
of  
statutes

1. There are three points to be considered in the construction of all remedial statutes; the old law, the mischief, and the remedy: that is, how the common law stood at the making of the act; what the mischief was, for which the common law did not provide; and what remedy the parliament hath provided to cure this mischief. And it is the business of the judges so to construe the act, as to suppress the mischief and advance the remedy. Let us instance again in the same restraining statute of 13 Eliz. c. 10. By the common law, ecclesiastical corporations might let as long leases as they thought proper: the mischief was, that they let long and unreasonable leases, to the impoverishment of their successors: the remedy applied by the statute was by making void all leases by ecclesiastical bodies for longer terms than three lives or 21 years. Now in the construction of this statute it is held, that leases, tho' for a longer term, if made by a bishop, are not void during the bishop's continuance in his see; or, if made by a dean and chapter, they are not void during the continuance of the dean; for the act was made for the benefit and protection of the successor. The mischief is therefore sufficiently suppressed by vacating them after the determination of the interest of the granters; but the leases, during their continuance, being not within the mischief, are not within the remedy.

2. A statute, which treats of things or persons of an inferior rank, cannot by any *general words* be extended to those of a superior. So a statute, treating of "deans, prebendaries, parsons, vicars, and others

having

(D) The method of citing these acts of parliament is various. Many of the ancient statutes are called after the name of the place where the parliament was held that made them; as the statutes of Merton and Marleberge, of Westminster, Gloucester, and Winchester. Others are denominated entirely from their subject; as the statutes of Wales and Ireland, the *articuli cleri*, and the *prerogativa regis*. Some are distinguished by their initial words, a method of citing very ancient: being used by the Jews, in denominating the books of the pentateuch; by the Christian church, in distinguishing their hymns and divine offices; by the Romanists, in describing their papal bulles; and in short by the whole body of ancient civilians and canonists, among whom this method of citation generally prevailed, not only with regard to chapters, but inferior sections also; in imitation of all which we still call some of the old statutes by their initial words, as the statute of *quia emptores*, and that of *circumspicte agatis*. But the most usual method of citing them, especially since the time of Edward the second, is by naming the year of the king's reign in which the statute was made, together with the chapter or particular act, according to its numerical order; as, 9 Geo. II. c. 4. For all the acts of one session of parliament taken together make properly but one statute; and therefore, when two sessions have been held in one year, we usually mention stat. 1. or 2. Thus the bill of rights is cited, as 1 W. & M. st. 2. c. 2. signifying that it is the second chapter or act of the second statute or the laws made in the second sessions of parliament held in the first year of king William and queen Mary.

Law of  
England.

having spiritual promotion," is held not to extend to bishops, though they have spiritual promotion; deans being the highest persons named, and bishops being of a still higher order.

3. Penal statutes must be construed strictly. Thus the statute 1 Edw. VI. c. 12. having enacted that those who are convicted of stealing *horses* should not have the benefit of clergy, the judges conceived that this did not extend to him who should steal but one *horse*, and therefore procured a new act for that purpose in the following year. And, to come nearer to our own times, by the statute 14 Geo. II. c. 6. stealing *sheep or other cattle*, was made felony without benefit of clergy. But these general words, "or other cattle," being looked upon as much too loose to create a capital offence, the act was held to extend to nothing but mere sheep. And therefore, in the next sessions, it was found necessary to make another statute, 15 Geo. II. c. 34. extending the former to bulls, cows, oxen, steers, bullocks, heifers, calves, and lambs, by name.

4. Statutes against frauds are to be liberally and beneficially expounded. This may seem a contradiction to the last rule; most statutes against frauds being in their consequences penal. But this difference is here to be taken: where the statute acts upon the offender, and inflicts a penalty, as the pillory or a fine, it is then to be taken strictly; but when the statute acts upon the offence, by setting aside the fraudulent transaction, here it is to be construed liberally. Upon this footing the statute of 13 Eliz. c. 5. which voids all gifts of goods, &c. made to defraud creditors *and others*, was held to extend by the general words to a gift made to defraud the queen of a forfeiture.

5. One part of a statute must be so construed by another, that the whole may (if possible) stand: *ut res magis valeat quam pereat*. As if land be vested in the king and his heirs by act of parliament, saving the right of A; and A has at that time a lease of it for three years; here A shall hold it for his term of three years, and afterwards it shall go to the king. For this interpretation furnishes matter for every clause of the statute to work and operate upon. But,

6. A saving, totally repugnant to the body of the act, is void. If therefore an act of parliament vests land in the king and his heirs, saving the right of all persons whatsoever; or vests the land of A in the king, saving the right of A: in either of these cases the saving is totally repugnant to the body of the statute, and (if good) would render the statute of no effect or operation; and therefore the saving is void, and the land vests absolutely in the king.

7. Where the common law and a statute differ, the common law gives place to the statute; and an old statute gives place to a new one. And this upon the general principle laid down in the last section, that *leges posteriores priores contrarias abrogant*. But this is to be understood, only when the latter statute is couched in negative terms, or by its matter necessarily implies a negative. As if a former act says, that a juror upon such a trial shall have twenty pounds a-year, and a new statute comes and says he shall have twenty marks; here the latter statute, tho' it does not express, yet necessarily implies, a negative, and virtually repeals the former. For if twenty marks be made qualification sufficient, the former statute which requires twenty

Law of  
England.

pounds is at an end. But if both acts be merely affirmative, and the substance such that both may stand together, here the latter does not repeal the former, but they shall both have a concurrent efficacy. If by a former law an offence be indictable at the quarter-sessions, and a later law makes the same offence indictable at the assizes; here the jurisdiction of the sessions is not taken away, but both have a concurrent jurisdiction, and the offender may be prosecuted at either: unless the new statute subjoins express negative words; as, that the offence shall be indictable at the assizes, *and not elsewhere*.

8. If a statute, that repeals another, is itself repealed afterwards, the first statute is hereby revived, without any formal words for that purpose. So when the statutes of 26 and 35 Hen. VIII. declaring the king to be the supreme head of the church, were repealed by a statute 1 and 2 Philip and Mary, and this latter statute was afterwards repealed by an act of 1 Eliz. there needed not any express words of revival in queen Elizabeth's statute, but these acts of king Henry were impliedly and virtually revived.

9. Acts of parliament derogatory from the power of subsequent parliaments bind not. So the statute 11 Hen. VII. c. 1. which directs, that no person for assisting a king *de facto* shall be attainted of treason by act of parliament or otherwise, is held to be good only as to common prosecutions for high treason; but will not restrain or clog any parliamentary attainder. Because the legislature, being in truth the sovereign power, is always of equal, always of absolute authority: it acknowledges no superior upon earth, which the prior legislature must have been if its ordinances could bind the present parliament. And upon the same principle Cicero, in his letters to Atticus, treats with a proper contempt these restraining clauses, which endeavour to tie up the hands of succeeding legislatures. "When you repeal the law itself, (says he,) you at the same time repeal the prohibitory clause which guards against such repeal."

10. Lastly, acts of parliament that are impossible to be performed are of no validity: and if there arise out of them collaterally any absurd consequences, manifestly contradictory to common reason, they are with regard to those collateral consequences void. We lay down the rule with these restrictions; though we know it is generally laid down more largely, that acts of parliament contrary to reason are void. But if the parliament will positively enact a thing to be done which is unreasonable, we know of no power that can control it: and the examples usually alleged in support of this sense of the rule do none of them prove, that, where the main object of a statute is unreasonable, the judges are at liberty to reject it; for that were to fetter the judicial power above that of the legislature, which would be subversive of all government. But where some collateral matter arises out of the general words, and happens to be unreasonable; there the judges are in decency to conclude that this consequence was not foreseen by the parliament, and therefore they are at liberty to expound the statute by equity, and only *quoad hoc* disregard it. Thus if an act of parliament gives a man power to try all causes that arise within his manor of Dale; yet, if a cause should arise in which he himself is party, the act is construed not to extend to that, because it is unreasonable that any man should

deter-

Law of  
England,  
analyzed.

determine his own quarrel. But, if we could conceive it possible for the parliament to enact, that he should try as well his own causes as those of other persons, there is no court that has power to defeat the intent of the legislature, when couched in such evident and express words as leave no doubt whether it was the intent of the legislature or no.

These are the several grounds of the laws of England: over and above which, equity is also frequently called in to assist, to moderate, and to explain them. What equity is, and how impossible in its very essence to be reduced to stated rules, hath been shewn above. It may be sufficient, therefore, to add in this place, that (besides the liberality of sentiment with which our common-law judges interpret acts of parliament, and such rules of the unwritten law as are not of a positive kind) there are also courts of equity established for the benefit of the subject, to detect latent frauds and concealments, which the process of the courts of law is not adapted to reach; to enforce the execution of such matters of trust and confidence, as are binding in conscience, though not cognizable in a court of law; to deliver from such dangers as are owing to misfortune or oversight; and to give a more specific relief, and more adapted to the circumstances of the case, than can always be obtained by the generality of the rules of the positive or common law. This is the business of the courts of equity, which however are only conversant in matters of property. For the freedom of our constitution will not permit, that in criminal cases a power should be lodged in any judge to confute the law otherwise than according to the letter. This caution, while it admirably protects the public liberty, can never bear hard upon individuals. A man cannot suffer more punishment than the law assigns, but he may suffer less. The laws cannot be strained by partiality to inflict a penalty beyond what the letter will warrant; but, in cases where the letter induces any apparent harshness, the crown has the power to pardon.

The objects of the laws of England are, 1. The rights of persons. 2. The rights of things. 3. Private wrongs. 4. Public wrongs.

## C H A P. I.

### Of the RIGHTS of PERSONS.

[xlv.]

#### SECT. I. *Of the absolute rights of individuals.*

(1.) THE objects of the *Laws of England* are, 1. *Rights*, 2. *Wrongs*.

(2.) *Rights* are the rights of *persons*, or the rights of *things*.

(3.) The rights of *persons* are such as concern, and are annexed to, the persons of men: and, when the person to whom they are due is regarded, they are called (simply) *rights*; but, when we consider the person from whom they are due, they are then denominated *duties*.

(4.) *Persons* are either *natural*, that is, such as they are formed by nature; or *artificial*, that is, created by human policy, as bodies politic or corporations.

(5.) The rights of *natural persons* are, 1. *Absolute*, or such as belong to individuals. 2. *Relative*, or such

as regard members of society.

(6.) The *absolute rights of individuals*, regarded by the municipal laws, (which pay no attention to duties of the absolute kind) comprise what is called political or civil liberty.

(7.) Political or civil liberty is the natural liberty of mankind, so far restrained by human laws as is necessary for the good of society.

(8.) The absolute rights or civil liberties of Englishmen, as frequently declared in parliament, are principally three; the right of *personal security*, of *personal liberty*, and of *private property*.

(9.) The right of *personal security* consists in the legal enjoyment of life, limb, body, health, and reputation.

(10.) The right of *personal liberty* consists in the free power of loco-motion, without illegal restraint or banishment.

(11.) The right of *private property* consists in every man's free use and disposal of his own lawful acquisitions, without injury or illegal diminution.

(12.) Besides these three *primary* rights, there are others which are *secondary* and subordinate; viz. (to preserve the former from unlawful attacks) 1. The constitution and power of parliaments; 2. The limitation of the king's prerogative:—And (to vindicate them when actually violated) 3. The regular administration of public justice; 4. The right of petitioning for redress of grievances; 5. The right of having and using arms for self-defence.

#### SECT. II. *Of the parliament.*

[xlv.]

(1.) THE relations of persons are, 1. *Public*. 2. *Private*. The public relations are those of magistrates and people. Magistrates are supreme or subordinate. And of supreme magistrates, in England, the parliament is the supreme legislative, the king the supreme executive.

(2.) Parliaments, in some shape, are of as high antiquity as the Saxon government in this island; and have subsisted, in their present form, at least five hundred years.

(3.) The parliament is assembled by the king's writs, and its sitting must not be intermitted above three years.

(4.) Its constituent parts are the king's majesty, the lords spiritual and temporal, and the commons represented by their members: each of which parts has a negative, or necessary, voice in making laws.

(5.) With regard to the general law of parliament; its power is absolute: each house is the judge of its own privileges; and all the members of either house are entitled to the privilege of speech, of person, of their domestics, and of their lands and goods.

(6.) The peculiar privileges of the lords (besides their judicial capacity) are to hunt in the king's forests; to be attended by the pages of the law; to make proxies; to enter protests; and to regulate the election of the 16 peers of North-Britain.

(7.) The peculiar privileges of the commons are to frame taxes for the subject; and to determine the merits of their own elections, with regard to the qualifications of the electors and elected, and the proceedings at elections themselves.

(8.) Bills are usually twice read in each house, committed, engrossed, and then read a third time; and

[ c ] when

Law of  
England,  
analyzed.

Law of  
England,  
analyzed.

when they have obtained the concurrence of both houses, and received the royal assent, they become *acts of parliament*.

(9.) The houses may adjourn themselves; but the king only can prorogue the parliament.

(10.) Parliaments are dissolved, 1. At the king's will. 2. By the demise of the crown, that is, within six months after. 3. By length of time, or having sat for the space of seven years.

[xvi.]

### SECT. III. *Of the king and his title.*

(1.) THE supreme executive power of this kingdom is lodged in a single person; the king or queen.

(2.) This royal person may be considered with regard to, 1. His title. 2. His royal family. 3. His councils. 4. His duties. 5. His prerogative. 6. His revenue.

(3.) With regard to his *title*; the crown of England, by the positive constitution of the kingdom, hath ever been defendible, and so continues.

(4.) The crown is defendible in a course peculiar to itself.

(5.) This course of descent is subject to limitation by parliament.

(6.) Notwithstanding such limitations, the crown retains its defendible quality, and becomes hereditary in the prince to whom it is limited.

(7.) King Egbert, king Canute, and king William I. have been successively constituted the common stocks, or ancestors, of this descent.

(8.) At the revolution the convention of estates, or representative body of the nation, declared, that the misconduct of king James II. amounted to an abdication of the government, and that the throne was thereby *vacant*.

(9.) In consequence of this vacancy, and from a regard to the ancient line, the convention appointed the next protestant heirs of the blood royal of king Charles I. to fill the vacant throne, in the old order of succession; with a temporary exception, or preference, to the person of king William III.

(10.) On the impending failure of the protestant line of king Charles I. (whereby the throne might again have become vacant) the king and parliament extended the settlement of the crown to the protestant line of king James I. viz. to the princess Sophia of Hanover, and the heirs of her body, being Protestants: And she is now the common stock, from whom the heirs of the crown must descend.

[xvii.]

### SECT. IV. *Of the king's royal family.*

(1.) THE king's royal family consists, first, of the queen: who is regnant, consort, or dowager.

(2.) The queen *consort* is a public person, and hath many personal prerogatives and distinct revenues.

(3.) The prince and princess of Wales, and the princes-royal, are peculiarly regarded by the law.

(4.) The other princes of the blood-royal are only intitled to precedence.

[xviii.]

### SECT. V. *Of the councils belonging to the king.*

(1.) THE king's councils are, 1. The parliament. 2. The great council of peers. 3. The judges, for matters of law. 4. The privy council.

(2.) In *privy-counsellors* may be considered, 1. Their

creation. 2. Their qualifications. 3. Their duties. 4. Their powers. 5. Their privileges. 6. Their dissolution.

Law of  
England,  
analyzed.

[xlix.]

### SECT. VI. *Of the king's duties.*

(1.) THE king's duties are to govern his people according to law, to execute judgment in mercy, and to maintain the established religion. These are his part of the original contract between himself and the people; founded in the nature of society, and expressed in his oath at the coronation.

### SECT. VII. *Of the king's prerogative.*

(1.) PREROGATIVE is that special power and pre-eminence, which the king hath above other persons, and out of the ordinary course of law, in right of his regal dignity.

(2.) Such prerogatives are either *direct*, or *incidental*. The *incidental*, arising out of other matters, are considered as they arise: We now treat only of the *direct*.

(3.) The *direct* prerogatives regard, 1. The king's dignity, or royal character; 2. His authority, or regal power; 3. His revenue, or royal income.

(4.) The king's dignity consists in the legal attributes of, 1. Personal sovereignty. 2. Absolute perfection. 3. Political perpetuity.

(5.) In the king's authority, or regal power, consists the executive part of government.

(6.) In *foreign* concerns, the king, as the representative of the nation, has the right or prerogative, 1. Of sending and receiving ambassadors. 2. Of making treaties. 3. Of proclaiming war or peace. 4. Of issuing reprisals. 5. Of granting safe-conducts.

(7.) In *domestic* affairs, the king is, first, a constituent part of the supreme legislative power; hath a negative upon all new laws; and is bound by no statute, unless specially named therein.

(8.) He is also considered as the general of the kingdom, and may raise fleets and armies, build forts, appoint havens, erect beacons, prohibit the exportation of arms and ammunition, and confine his subjects within the realm, or recall them from foreign parts.

(9.) The king is also the fountain of justice, and general conservator of the peace; and therefore may erect courts (wherein he hath a legal ubiquity) prosecute offenders, pardon crimes, and issue proclamations.

(10.) He is likewise the fountain of honour, of office, and of privilege.

(11.) He is also the arbiter of *domestic* commerce; (not of *foreign*, which is regulated by the law of merchants); and is therefore entitled to the erection of public marts, the regulation of weights and measures; and the coinage or legitimation of money.

(12.) The king is, lastly, the supreme head of the church; and, as such, convokes, regulates and dissolves synods, nominates bishops, and receives appeals in all ecclesiastical causes.

### SECT. VIII. *Of the king's revenue.*

(1.) THE king's revenue is either *ordinary* or *extraordinary*. And the ordinary is, 1. Ecclesiastical. 2. Temporal.

(2.) THE king's ecclesiastical revenue consists in, 1. The custody of the temporalities of vacant bishopricks.

I.

I.

Law of  
England,  
analyzed.

rick. 2. Corodies and pensions. 3. Extra-parochial tithes. 4. The first fruits and tenths of benefices.

(3.) The *king's* ordinary *temporal* revenue consists in, 1. The demesne lands of the crown. 2. The hereditary excise; being part of the consideration for the purchase of his feudal profits, and the prerogatives of purveyance and pre-emption. 3. An annual sum issuing from the duty on wine licences; being the residue of the same consideration. 4. His forests. 5. His courts of justice. 6. Royal fish. 7. Wrecks, and things jet-fam, flotam, and ligan. 8. Royal mines. 9. Treasure trove. 10. Waifs. 11. Eitrays. 12. Forfeitures for offences, and deadends. 13. Escheats of lands. 14. Custody of ideots and lunatics.

(4.) The *king's* extraordinary revenue consists in aids, subsidies, and supplies, granted him by the commons in parliament.

(5.) Heretofore these were usually raised by grants of the (nominal) *tenth* or *fifteenth* part of the moveables in every township; or by scutages, hydages, and tallages; which were succeeded by *subsidies* assessed upon individuals, with respect to their lands and goods.

(6.) A new system of taxation took place about the time of the revolution: our modern taxes are therefore, 1. *Annual*. 2. *Perpetual*.

(7.) The *annual taxes* are, 1. The land-tax, or the ancient subsidy raised upon a new assessment. 2. The malt-tax, being an annual excise on malt, mum, cyder, and perry.

(8.) The *perpetual taxes* are, 1. The customs, or tonnage and poundage of all merchandise exported or imported. 2. The excise-duty, or inland imposition on a great variety of commodities. 3. The salt-duty, or excise on salt. 4. The post-office, or duty for the carriage of letters. 5. The stamp-duty on paper, parchment, &c. 6. The duty on houses and windows. 7. The duty on licences for hackney coaches and chairs. 8. The duty on offices and pensions.

(9.) Part of this revenue is applied to pay the interest of the national debt, till the principal is discharged by parliament.

(10.) The produce of these several taxes were originally separate and *specific funds*, to answer *specific loans* upon their respective credits; but are now consolidated by parliament into three principal funds, the *aggregate, general, and South-sea funds*, to answer all the debts of the nation: the public faith being also superadded, to supply deficiencies, and strengthen the security of the whole.

(11.) The surpluses of these funds, after paying the interest of the national debt, are carried together, and denominated the *sinking fund*: which, unless otherwise appropriated by parliament, is annually to be applied towards paying off some part of the principal.

(12.) But, previous to this, the *aggregate fund* is now charged with an annual sum for the *civil list*; which is the immediate proper revenue of the crown, settled by parliament on the king at his accession, for defraying the charges of civil government.

#### SECT. IX. Of subordinate magistrates.

(1.) SUBORDINATE magistrates, of the most general aid and authority, are, 1. *Sheriffs*. 2. *Coroners*. 3. *Justices of the Peace*. 4. *Constables*. 5. *Surveyors*

of the *highways*. 6. *Overseers of the poor*.

(2.) The *sheriff* is the keeper of each county, annually nominated in due form by the king; and is (within his county) a judge, a conservator of the peace, a ministerial officer, and the king's bailiff.

(3.) *Coroners* are permanent officers of the crown in each county, elected by the freeholders; whose office it is to make enquiry concerning the death of the king's subjects, and certain revenues of the crown; and also, in particular cases, to supply the office of sheriff.

(4.) *Justices of the peace* are magistrates in each county, statutely qualified, and commissioned by the king's majesty: with authority to conserve the peace; to hear and determine felonies, and other misdemeanours; and to do many other acts, committed to their charge by particular statutes.

(5.) *Constables* are officers of hundreds and townships, appointed at the lect, and empowered to preserve the peace, to keep watch and ward, and to apprehend offenders.

(6.) *Surveyors of the highways* are officers appointed annually in every parish; to remove annoyances in, and to direct the reparation of, the public roads.

(7.) *Overseers of the poor* are officers appointed annually in every parish; to relieve such impotent, and employ such sturdy poor, as are *settled* in each parish,—by birth,—by parentage,—by marriage,—or by forty days residence; accompanied with, 1. Notice. 2. Renting a tenement of ten pounds annual value. 3. Paying their assessed taxations. 4. Serving an annual office. 5. Hiring and service for a year. 6. Apprenticeship for seven years. 7. Having a sufficient estate in the parish.

#### SECT. X. Of the people, whether aliens, denizens, or natives. III.

(1.) THE people are either *aliens*, that is, born out of the dominions, or allegiance, of the crown of Great Britain; or *natives*, that is, born within it.

(2.) Allegiance is the duty of all subjects; being the reciprocal tie of the people to the prince, in return for the protection he affords them; and, in *natives*, this duty of allegiance is natural and perpetual; in *aliens*, is local and temporary only.

(3.) The rights of *natives* are also natural and perpetual: those of *aliens*, local and temporary only; unless they be made denizens by the king, or naturalized by parliament.

#### SECT. XI. Of the clergy. liv.

(1.) THE people, whether aliens, denizens, or natives, are also either *clergy*, that is, all persons in holy orders, or in ecclesiastical offices; or *laity*, which comprehends the rest of the nation.

(2.) The *clerical* part of the nation, thus defined, are, 1. Archbishops and bishops; who are elected by their several chapters, at the nomination of the crown, and afterwards confirmed and consecrated by each other. 2. Deans and chapters. 3. Arch-deacons. 4. Rural deans. 5. Parsons (under which are included appropriators), and vicars; to whom there are generally requisite, holy orders, presentation, institution, and induction. 6. Curates. To which may be added; 7. Churchwardens. 8. Parish-clerks and sextons.

SECT. XII. *Of the civil state.*

(1.) THE *laity* are divisible into three states; *civil*, *military*, and *maritime*.

(2.) The *civil* state (which includes all the nation, except the clergy, the army, and the navy; and many individuals among them also,) may be divided into the *nobility*, and the *commonalty*.

(3.) The *nobility* are dukes, marquises, earls, viscounts, and barons. These had anciently duties annexed to their respective honours: they are created either by writ, that is, by summons to parliament; or by the king's letters-patent, that is, by royal grant: and they enjoy many privileges, exclusive of their senatorial capacity.

(4.) The *commonalty* consist of, knights of the garter, knights bannerets, baronets, knights of the bath, knights bachelors, esquires, gentlemen, yeomen, tradesmen, artificers, and labourers.

iv. SECT. XIII. *Of the military and maritime states.*

(1.) The *military* state, by the standing constitutional law, consists of the militia of each county, raised from among the people by lot, officered by the principal landholders, and commanded by the lord lieutenant.

(2.) The more disciplined occasional troops of the kingdom are kept on foot only from year to year, by parliament; and, during that period, are governed by martial law, or arbitrary articles of war, formed at the pleasure of the crown.

(3.) The *maritime* state consists of the officers and mariners of the British navy; who are governed by express and permanent laws, or the articles of the navy, established by act of parliament.

lvii. SECT. XIV. *Of master and servant.*

(1.) The *private*, economical, relations of persons are those of, 1. *Master and servant*. 2. *Husband and wife*. 3. *Parent and child*. 4. *Guardian and ward*.

(2.) The first relation may subsist between a *master* and four species of *servants*; (for slavery is unknown to our laws): viz. 1. Menial servants; who are *hired*. 2. Apprentices; who are *bound* by indentures. 3. Labourers; who are *casually employed*. 4. Stewards, bailiffs, and factors; who are *rather* in a *ministerial* state.

(3.) From this relation result diverse powers to the master, and emoluments to the servant.

(4.) The master hath a property in the service of his servant; and must be answerable for such acts as the servant does by his express, or implied, command.

lviii. SECT. XV. *Of husband and wife.*

(1.) THE second private relation is that of *marriage*; which includes the reciprocal rights and duties of *husband and wife*.

(2.) *Marriage* is duly contracted between persons, 1. Consenting. 2. Free from canonical impediments, which make it *voidable*: 3. Free also from the civil impediments,—of prior marriage;—of want of age;—of non-consent of parents or guardians, where requisite;—and of want of reason; either of which make it *totally void*. And it must be celebrated by a clergyman, in due form and place.

(3.) Marriage is dissolved, 1. By death. 2. By di-

vorce in the spiritual court; not *a mensa et thoro* only, but *a vinculo matrimonii*, for canonical cause existing previous to the contract. 3. By act of parliament, as for adultery.

(4.) By marriage the husband and wife become one person in law; which unity is the principal foundation of their respective rights, duties, and disabilities.

SECT. XVI. *Of parent and child.*

lix.

(1.) THE third, and most universal, private relation is that of *parent and child*.

(2.) *Children* are, 1. *Legitimate*; being those who are born in lawful wedlock, or within a competent time after. 2. *Bastards*, being those who are not so.

(3.) The duties of parents to *legitimate* children are, 1. Maintenance. 2. Protection. 3. Education.

(4.) The power of parents consists principally in correction, and consent to marriage. Both may after death be delegated by will to a guardian; and the former also, living the parent, to a tutor or master.

(5.) The duties of *legitimate* children to parents are obedience, protection, and maintenance.

(6.) The duty of parents to *bastards* is only that of maintenance.

(7.) The rights of a *bastard* are such only as he can acquire; for he is incapable of inheriting any thing.

SECT. XVII. *Of guardian and ward.*

lx.

(1.) THE fourth private relation is that of *guardian and ward*, which is plainly derived from the last; these being, during the continuance of their relation, reciprocally subject to the same rights and duties.

(2.) *Guardians* are of divers sorts: 1. Guardians by nature, or the parents. 2. Guardians for nurture, assigned by the ecclesiastical courts. 3. Guardians in socage, assigned by the common law. 4. Guardians by statute, assigned by the father's will. All subject to the superintendence of the court of chancery.

(3.) *Full age* in male or female for all purposes is the age of 21 years, (different ages being allowed for different purposes;) till which age the person is an *infant*.

(4.) An *infant*, in respect of his tender years, hath various privileges, and various disabilities, in law; chiefly with regard to suits, crimes, estates, and contracts.

SECT. XVIII. *Of corporations.*

lxi.

(1.) BODIES politic, or *corporations*, which are *artificial* persons, are established for preserving in perpetual succession certain rights; which, being conferred on *natural* persons only, would fail in process of time.

(2.) Corporations are, 1. *Aggregate*, consisting of many members. 2. *Sole*, consisting of one person only.

(3.) Corporations are also either *spiritual*, erected to perpetuate the rights of the church; or *lay*. And the lay are, 1. *Civil*; erected for many temporal purposes. 2. *Eleemosynary*; erected to perpetuate the charity of the founder.

(4.) Corporations are usually erected, and named, by virtue of the king's royal charter; but may be created by act of parliament.

(5.) The powers incident to all corporations are, 1. To maintain perpetual succession. 2. To act in their corporate capacity like an individual. 3. To hold lands, subject

Law of England, analyzed.

Law of England, analyzed.

subject to the statutes of mortmain. 4. To have a common seal. 5. To make by-laws. Which last power, in spiritual or eleemosynary corporations, may be executed by the king or the founder.

(6.) The duty of corporations is to answer the ends of their institution.

(7.) To enforce this duty, all corporations may be visited: spiritual corporations by the ordinary; lay corporations by the founder, or his representatives; viz. the civil by the king (who is the *fundator incipiens* of all) represented in his court of king's bench; the eleemosynary by the endower, (who is the *fundator perfectiens* of such), or by his heirs or assigns.

(8.) Corporations may be dissolved, 1. By act of parliament. 2. By the natural death of all their members. 3. By surrender of their franchises. 4. By forfeiture of their charter.

## CHAP. II.

### Of the RIGHTS of THINGS.

#### SECT. I. Of Property in general.

(1.) ALL dominion over external objects has its original from the gift of the Creator to man in general.

(2.) The substance of things was, at first, common to all mankind; yet a temporary property, in the use of them, might even then be acquired, and continued, by occupancy.

(3.) In process of time a permanent property was established in the substance, as well as the use, of things; which was also originally acquired by occupancy only.

(4.) Left this property should determine by the owner's dereliction or death, whereby the thing would again become common, societies have established conveyances, wills, and heirships, in order to continue the property of the first occupant: and, where by accident such property becomes discontinued or unknown, the thing usually reverts to the sovereign of the state, by virtue of the municipal law.

(5.) But of some things, which are incapable of permanent substantial dominion, there still subsists only the same transient usufructuary property, which originally subsisted in all things.

#### SECT. II. Of real property; and, first, of corporeal hereditaments.

(1.) In this property, or exclusive dominion, consist the rights of things; which are, 1. Things real. 2. Things personal.

(2.) In things real may be considered, 1. Their several kinds. 2. The tenures, by which they may be holden. 3. The estates which may be acquired therein. 4. Their title, or the means of acquiring and losing them.

(3.) All the several kinds of things real are reducible to one of these three, viz. lands, tenements, or hereditaments; whereof the second includes the first, and the third includes the first and second.

(4.) Hereditaments therefore, or whatever may come to be inherited, (being the most comprehensive denomination of things real,) are either corporeal or incorporeal.

(5.) Corporeal hereditaments consist wholly of lands, in their largest legal sense; wherein they include not only the face of the earth, but every other object of sense adjoining thereto, and subsisting either above or beneath it.

#### SECT. III. Of incorporeal hereditaments.

(1.) INCORPOREAL hereditaments are rights issuing out of things corporeal, or concerning, or annexed to, or exercisable within, the same.

(2.) Incorporeal hereditaments are, 1. Advowsons. 2. Tithes. 3. Commons. 4. Ways. 5. Offices. 6. Dignities. 7. Franchises. 8. Corodies or pensions. 9. Annuities. 10. Rents.

(3.) An advowson is a right of presentation to an ecclesiastical benefice; either appendant, or in gross. This may be, 1. Presentative. 2. Collative. 3. Donative.

(4.) Tithes are the tenth part of the increase yearly arising from the profits and stock of lands, and the personal industry of mankind. These, by the ancient and positive law of the land, are due of common right to the parson, or (by endowment) to the vicar; unless specially discharged, 1. By real composition. 2. By Prescription, either *de modo decimandi*, or *de non decimando*.

(5.) Common is a profit which a man hath in the lands of another; being, 1. Common of pasture; which is either appendant, appurtenant, because of vicinage, or in gross. 2. Common of piscary. 3. Common of turbary. 4. Common of clovers, or botes.

(6.) Ways are a right of passing over another man's ground.

(7.) Offices are the right to exercise a public or private employment.

(8.) For dignities, which are titles of honour, see Chap. I. Sect. 12.

(9.) Franchises are a royal privilege, or branch of the king's prerogative, subsisting in the hands of a subject.

(10.) Corodies are allotments for one's sustenance; which may be converted into pensions. (See Chap. I. Sect. 8.)

(11.) An annuity is a yearly sum of money, charged upon the person, and not upon the lands of the grantor.

(12.) Rents are a certain profit issuing yearly out of lands and tenements; and are reducible to, 1. Rent-service. 2. Rent-charge. 3. Rent-secck.

#### SECT. IV. Of the Feodal System.

(1.) THE doctrine of tenure is derived from the feodal law; which was planted in Europe by its northern conquerors at the dissolution of the Roman empire.

(2.) Pure and proper feuds were parcels of land allotted by a chief to his followers, to be held on the condition of personally rendering due military service to their lord.

(3.) These were granted by investiture; were held under the bond of fealty; were inheritable only by descendants; and could not be transferred without the mutual consent of the lord and vassal.

(4.) Improper feuds were derived from the other; but

lxi.

lxii.

lxiv.

lxv.

lxvi.

Law of  
England,  
analyzed.

Law of  
England,  
analyzed.

but differed from them in their original, their services and renders, their descent, and other circumstances.

(5.) The lands of England were converted into *fiefs*, of the improper kind, soon after the Norman conquest: which gave rise to the grand maxim of tenure, viz. That all lands in the kingdom are *holden*, mediately or immediately, of the king.

lxvii.

#### SECT. V. Of the ancient English tenures.

(1.) THE distinction of tenures consisted in the nature of their services: as, 1. *Chivalry*, or *knight-service*; where the service was free, but uncertain. 2. *Free socage*; where the service was free, and certain. 3. *Pure villenage*; where the service was base, and uncertain. 4. *Privileged villenage*, or *villain socage*; where the service was base, but certain.

(2.) The most universal ancient tenure was that in *chivalry*, or by *knight-service*; in which the tenant of every knight's fee was bound, if called upon, to attend his lord to the wars. This was granted by livery, and perfected by homage and fealty; which usually drew after them suit of court.

(3.) The other fruits and consequences of the tenure by knight-service were, 1. Aid. 2. Relief. 3. Primer seisin. 4. Wardship. 5. Marriage. 6. Fines upon alienation. 7. Escheat.

(4.) *Grand serjeanty* differed from *chivalry* principally in its render, or service; and not in its fruits and consequences.

(5.) The personal service in *chivalry* was at length gradually changed into pecuniary assessments, which were called *scutage* or *escuage*.

(6.) These military tenures (except the services of grand serjeanty) were, at the restoration of King Charles, totally abolished, and reduced to free socage by act of parliament.

lxviii.

#### SECT. VI. Of the modern English tenures.

(1.) *FREE socage* is a tenure by any free, certain, and determinate service.

(2.) This tenure, the relic of Saxon liberty, includes *petit serjeanty*, tenure in *burgage*, and *gavelkind*.

(3.) Free socage lands partake strongly of the feudal nature, as well as those in *chivalry*: being holden; subject to some service, at the least to fealty and suit of court; subject to relief, to wardship, and to escheat, but not to marriage; subject also formerly to aids, primer seisin, and fines for alienation.

(4.) *Pure villenage* was a precarious and slavish tenure, at the absolute will of the lord, upon uncertain services of the basest nature.

(5.) From hence, by tacit consent or encroachment, have arisen the modern *copholds*, or tenure by copy of court-roll; in which lands may be still held at the (nominal) will of the lord, (but regulated) according to the custom of the manor.

(6.) These are subject, like socage lands, to services, relief, and escheat; and also to heriots, wardship, and fines upon descent and alienation.

(7.) *Privileged villenage*, or *villain socage*, is an exalted species of *cophold* tenure, upon base, but certain, services; subsisting only in the ancient demesnes of the crown; whence the tenure is denominated the tenure in *ancient demesne*.

(8.) These *copholds* of ancient demesne have di-

vers immunities annexed to their tenure; but are still held by copy of court-roll, according to the custom of the manor, though not at the will of the lord.

(9.) *Frankalmoin* is a tenure by spiritual services at large, whereby many ecclesiastical and eleemosynary corporations now hold their lands and tenements; being of a nature distinct from tenure by divine service in certain.

#### SECT. VII. Of freehold estates of inheritance.

lxix.

(1.) ESTATES in lands, tenements, and hereditaments, are such interest as the tenant hath therein; to ascertain which, may be considered, 1. The quantity of interest. 2. The time of enjoyment. 3. The number and connexions of the tenants.

(2.) Estates, with respect to their quantity of interest, or duration, are either *freehold*, or *less than freehold*.

(3.) A *freehold* estate, in lands, is such as is created by livery of seisin at common law; or, in tenements of an incorporeal nature, by what is equivalent thereto.

(4.) Freehold estates are either estates of inheritance, or not of inheritance, viz. for life only: and inheritances are, 1. *Absolute*, or *fee simple*. 2. *Limited fees*.

(5.) Tenant in *fee simple* is he that hath lands, tenements, or hereditaments, to hold to him and his heirs for ever.

(6.) *Limited fees* are, 1. *Qualified*, or *base*, fees. 2. *Fees conditional* at the common law.

(7.) *Qualified or base fees* are those which, having a qualification subjoined thereto, are liable to be defeated when that qualification is at an end.

(8.) *Conditional fees*, at the common law, were such as were granted to the donee, and the heirs of his body, in exclusion of collateral heirs.

(9.) These were held to be fees, granted on condition that the donee had issue of his body; which condition being once performed by the birth of issue, the donee might immediately alienate the land: but, the statute *de donis* being made to prevent such alienation, thereupon from the division of the fee (by construction of this statute) into a particular estate and a reversion, the conditional fees began to be called *fee-tail*.

(10.) All tenements real, or favouring of the realty, are subject to entails.

(11.) Estates tail may be, 1. general, or special; 2. male, or female; 3. given in frank marriage.

(12.) Incident to estates tail are, 1. Waste. 2. Dower. 3. Courtesy. 4. Bar;—by fine, recovery, or lineal warranty with affects.

(13.) Estates tail are now, by many statutes and resolutions of the courts, almost brought back to the state of conditional fees at the common law.

#### SECT. VIII. Of freeholds, not of inheritance.

lxx.

(1.) FREEHOLDS, not of inheritance, or for life only, are, 1. *Conventional*, or created by the act of the parties. 2. *Legal*, or created by operation of law.

(2.) *Conventional* estates for life are created by an express grant for term of one's own life, or *pur autre vie*; or by a general grant, without expressing any term at all.

(3.) Incident to this, and all other estates for life, are cloggers, and emblements: and to estates *pur autre vie*.

Law of  
England,  
analyzed.

Law of  
England,  
analyzed.

*vie* general occupancy was also incident; as special occupancy still is, if *cestuy que vie* survives the tenant.

(4.) *Legal* estates for *life* are, 1. Tenancy in *tail*, after *possibility* of issue *extinct*. 2. Tenancy by the *curtesy* of England. 3. Tenancy in *dower*.

(5.) Tenancy in *tail*, after *possibility* of issue *extinct*, is where an estate is given in special *tail*; and, before issue had, a person dies from whose body the issue was to spring; whereupon the tenant (if surviving) becomes tenant in *tail*, after *possibility* of issue *extinct*.

(6.) This estate partakes both of the incidents to an estate *tail*, and those of an estate for *life*.

(7.) Tenancy by the *curtesy* of England is where a man's wife is seized of an estate of inheritance; and he by her has issue, born alive, which was capable of inheriting her estate; in which case he shall, upon her death, hold the tenements for his own life, as tenant by the *curtesy*.

(8.) Tenancy in *dower* is where a woman's husband is seized of an estate of inheritance, of which her issue might by any possibility have been heir; and the husband dies: the woman is hereupon entitled to *dower*, or one third part of the lands and tenements, to hold for her natural life.

(9.) *Dower* is either by the common law; by special custom; *ad osium ecclesie*; or, *ex assensu patris*.

(10.) *Dower* may be forfeited or barred, particularly by an estate in *jointure*.

#### SECT. IX. Of estates less than freehold.

(1.) ESTATES less than freehold are, 1. Estates for *years*. 2. Estates at *will*. 3. Estates at *sufferance*.

(2.) An estate for *years* is where a man, seized of lands and tenements, letteth them to another for a certain period of time, which transfers the interest of the term; and the lessee enters thereon, which gives him possession of the term, but not legal seisin of the land.

(3.) Incident to this estate are covenants; and also emblements, if it determines before the full end of the term.

(4.) An estate at *will* is where lands are let by one man to another, to hold at the will of both parties; and the lessee enters thereon.

(5.) *Copholds* are estates held at the will of the lord, (regulated) according to the custom of the manor.

(6.) An estate at *sufferance* is where one comes into possession of land by lawful title, but keeps it afterwards without any title at all.

#### SECT. X. Of estates upon condition.

(1.) ESTATES (whether freehold or otherwise) may also be held upon *condition*; in which case their existence depends on the happening, or not happening, of some uncertain event.

(2.) These estates are, 1. On condition *implied*. 2. On condition *expressed*. 3. Estates in *gage*. 4. Estates by *statute*, merchant or staple. 5. Estates by *eligit*.

(3.) Estates on condition *implied* are where a grant of an estate has, from its essence and constitution, a condition inseparably annexed to it; though none be expressed in words.

(4.) Estates on condition *expressed* are where an express qualification or provision is annexed to the grant

of an estate.

(5.) On the performance of these conditions either expressed or implied (if *precedent*) the estate may be vested or enlarged; or, on the breach of them (if *subsequent*) an estate already vested may be defeated.

(6.) Estates in *gage*, in *vadio*, or in pledge, are estates granted as a security for money lent; being 1. *In vivo vadio*, or *living gage*; where the profits of land are granted till a debt be paid, upon which payment the grantor's estate will revive. 2. *In mortuo vadio*, in *dead*, or *mort gage*; where an estate is granted, on condition to be void at a day certain, if the grantor then repays the money borrowed; on failure of which, the estate becomes absolutely dead to the grantor.

(7.) Estates by *statute-merchant*, or *statute-staple*, are also estates conveyed to creditors, in pursuance of certain statutes, till their profits shall discharge the debt.

(8.) Estates by *eligit* are where, in consequence of a judicial writ so called, lands are delivered by the sheriff to a plaintiff, till their profits shall satisfy a debt adjudged to be due by law.

#### SECT. XI. Of estates in possession, remainder, and reversion.

(1.) ESTATES, with respect to their time of enjoyment, are either in immediate *possession*, or in *expectancy*; which estates in *expectancy* are created at the same time, and are parcel of the same estates, as those upon which they are expectant. These are, 1. *Remainders*. 2. *Reversions*.

(2.) A *remainder* is an estate limited to take effect, and be enjoyed, after another particular estate is determined.

(3.) Therefore, 1. There must be a precedent particular estate, in order to support a remainder. 2. The remainder must pass out of the grantor, at the creation of the particular estate. 3. The remainder must vest in the grantee, during the continuance, or at the determination, of the particular estate.

(4.) *Remainders* are, 1. *Vested*; where the estate is fixed to remain to a certain person, after the particular estate is spent. 2. *Contingent*; where the estate is limited to take effect, either to an uncertain person, or upon an uncertain event.

(5.) An *executory devise* is such a disposition of lands, by will, that an estate shall not vest thereby at the death of the deviser, but only upon some future contingency, and without any precedent particular estate to support it.

(6.) A *reversion* is the residue of an estate left in the grantor, to commence in possession after the determination of some particular estate granted: to which are incident fealty, and rent.

(7.) Where two estates, the one less, the other greater, the one in possession, the other in expectancy, meet together in one and the same person, and in one and the same right, the less is merged in the greater.

#### SECT. XII. Of estates, in severalty, joint tenancy, coparcenary, and common.

(1.) ESTATES, with respect to the number and connections of their tenants, may be held, 1. In *severalty*.

lxxi.

lxxiii.

lxxii.

lxxiv.

Law of  
England,  
analyzed.

ty. 2. In *joint-tenancy*. 3. In *coparcenary*. 4. In *common*.

(2.) An estate in *severalty* is where one tenant holds it in his own sole right, without any other person being joined with him.

(3.) An estate in *joint-tenancy* is where an estate is granted to two or more persons; in which case the law construes them to be *joint-tenants*, unless the words of the grant expressly exclude such construction.

(4.) Joint-tenants have an unity of interest, of title, of time, and of possession: they are seized *per my & per tout*: and therefore upon the decease of one joint-tenant, the whole interest remains to the survivor.

(5.) Joint-tenancy may be dissolved, by destroying one of its four constituent unities.

(6.) An estate in *coparcenary* is where an estate of inheritance descends from the ancestor to two or more persons; who are called *parceners*, and all together make but one heir.

(7.) Parceners have an unity of interest, title, and possession; but are only seized *per my*, and not *per tout*: wherefore there is no survivorship among parceners.

(8.) Incident to this estate is the law of *hotchpot*.

(9.) Coparcenary may also be dissolved, by destroying any of its three constituent unities.

(10.) An estate in *common* is where two or more persons hold lands, possibly by distinct titles, and for distinct interests; but by unity of possession, because none knoweth his own severalty.

(11.) Tenants in common have therefore an unity of possession, (without survivorship; being seized *per my*, and not *per tout*;) but no necessary unity of title, time, or interest.

(12.) This estate may be created, 1. By dissolving the constituent unities of the two former; 2. By expressing limitation in a grant: and may be destroyed, 1. By uniting the several titles in one tenant; 2. By partition of the land.

### lxxv. SECT. XIII. *Of the title to things real, in general.*

(1.) A *title* to things real is the means whereby a man cometh to the just possession of his property.

(2.) Herein may be considered, 1. A mere or naked possession. 2. The right of possession; which is, *is*, an apparent, *adly*, an actual, right. 3. The mere right of property. 4. The conjunction of actual possession with both these rights; which constitutes a perfect title.

### lxxvi. SECT. XIV. *Of title by descent.*

(1.) THE *title* to things real may be reciprocally acquired or lost, 1. By *descent*. 2. By *purchase*.

(2.) *Descent* is the means whereby a man, on the death of his ancestor, acquires a title to his estate, in right of representation, as his *heir* at law.

(3.) To understand the doctrine of descents, we must form a clear notion of *consanguinity*; which is the connexion, or relation, of persons descended from the same stock or common ancestor; and it is, 1. *Lineal*, where one of the kinsmen is lineally descended from the other. 2. *Collateral*, where they are lineally descended, not one from the other, but both from the same common ancestor.

Law of  
England,  
analyzed.

(4.) The rules of descent, or *canons of inheritance*, observed by the laws of England, are these:

1<sup>st</sup>, Inheritances shall lineally descend to the issue of the person last actually seized, *in infinitum*; but shall never lineally ascend.

2<sup>d</sup>, The male issue shall be admitted before the female.

3<sup>d</sup>, Where there are two or more males in equal degree, the eldest only shall inherit; but the females all together.

4<sup>th</sup>, The lineal descendants, *in infinitum*, of any person deceased shall represent their ancestor; that is, shall stand in the same place as the person himself would have done, had he been living.

5<sup>th</sup>, On failure of lineal descendants, or issue, of the person last seized, the inheritance shall descend to the blood of the first purchaser; subject to the three preceding rules. To evidence which blood, the two following rules are established.

6<sup>th</sup>, The collateral heir of the person last seized must be his next collateral kinsman, of the whole blood.

7<sup>th</sup>, In collateral inheritances, the male stock shall be preferred to the female; that is, kindred derived from the blood of the male ancestors shall be admitted before those from the blood of the female: unless where the lands have, in fact, descended from a female.

### SECT. XV. *Of title by purchase, and first by escheat.*

lxxvii

(1.) PURCHASE, or perquisition, is the possession of an estate which a man hath by his own act or agreement; and not by the mere act of law, or descent from any of his ancestors. This includes, 1. *Escheat*.

2. *Occupancy*. 3. *Prescription*. 4. *Forfeiture*. 5. *Alienation*.

(2.) *Escheat* is where, upon deficiency of the tenant's inheritable blood, the estate falls to the lord of the fee.

(3.) *Inheritable blood* is wanting to, 1. Such as are not related to the person last seized. 2. His maternal relations in paternal inheritances, and *vice versa*. 3. His kindred of the half blood. 4. Monks. 5. Bastards. 6. Aliens, and their issue. 7. Persons attainted of treason or felony. 8. Papists, in respect of themselves only, by the statute law.

### SECT. XVI. *Of title by occupancy.*

lxxviii

(1.) OCCUPANCY is the taking possession of those things which before had no owner.

(2.) Thus, at the common law, where tenant *pur auter vie* died during the life of *cestuy que vie*, he, who could first enter, might lawfully retain the possession; unless by the original grant the heir was made a special occupant.

(3.) The law of *derelictions* and *alluvions* has narrowed the title by occupancy.

### SECT. XVII. *Of title by prescription.*

lxxix

(1.) PRESCRIPTION (as distinguished from *custom*) is a personal immemorial usage of enjoying a right in some incorporeal hereditament, by a man, and either his ancestors or those whose estate of inheritance he hath: of which the first is called *prescribing in his ancestors*, the latter in a *que estate*.

Law of  
England,  
analyzed.

Law of  
England,  
analyzed.

### SECT. XVIII. *Of title by forfeiture.*

(1.) FORFEITURE is a punishment annexed by law to some illegal act, or negligence, in the owner of things real; whereby the estate is transferred to another, who is usually the party injured.

(2.) Forfeitures are occasioned, 1. By crimes. 2. By alienation, contrary to law. 3. By *lapse*. 4. By *simony*. 5. By nonperformance of conditions. 6. By *waste*. 7. By breach of copyhold customs. 8. By bankruptcy.

(3.) Forfeitures for crimes, or misdemeanours, are for, 1. Treason. 2. Felony. 3. Misprision of treason. 4. *Premunire*. 5. Assaults on a judge, and batteries, sitting the courts. 6. Popish recusancy, &c.

(4.) Alienations, or conveyances, which induce a forfeiture, are, 1. Those in mortmain, made to corporations contrary to the statute law. 2. Those made to aliens. 3. Those made by particular tenants, when larger than their estates will warrant.

(5.) *Lapse* is a forfeiture of the right of presentation to a vacant church, by neglect of the patron to present within six calendar months.

(6.) *Simony* is the corrupt presentation of any one to an ecclesiastical benefice, whereby that turn becomes forfeited to the crown.

(7.) For forfeiture by nonperformance of conditions, see Sect. 10.

(8.) *Waste* is a spoil, or destruction, in any corporeal hereditaments, to the prejudice of him that hath the inheritance.

(9.) Copyhold estates may have also other peculiar causes of forfeiture, according to the custom of the manor.

(10.) *Bankruptcy* is the act of becoming a bankrupt; that is, a trader who secretes himself, or does certain other acts tending to defraud his creditors, (See Sect. 22.)

(11.) By bankruptcy all the estates of the bankrupt are transferred to the assignees of his commissioners, to be sold for the benefit of his creditors.

### SECT. XIX. *Of title by alienation.*

(1.) ALIENATION, conveyance, or purchase in its more limited sense, is a means of transferring real estates, wherein they are voluntarily resigned by one man, and accepted by another.

(2.) This formerly could not be done by a tenant, without licence from his lord; nor by a lord, without attornment of his tenant.

(3.) All persons are capable of purchasing; and all that are in possession of any estates, are capable of conveying them; unless under peculiar disabilities by law; as being attainted, non compos, infants, under dures, feme-coverts, aliens, or papists.

(4.) Alienations are made by common assurances; which are, 1. By deed, or matter in pais. 2. By matter of record. 3. By special custom. 4. By devise.

### SECT. XX. *Of alienation by deed.*

(1.) In assurances by deed may be considered, 1. Its general nature. 2. Its several species.

(2.) A deed, in general, is the solemn act of the parties; being, usually, a writing sealed and delivered; and it may be, 1. A deed indented, or indenture. 2. A

deed-poll.

(3.) The requisites of a deed are, 1. Sufficient parties, and proper subject-matter. 2. A good and sufficient consideration. 3. Writing on paper, or parchment, duly stamped. 4. Legal and orderly parts: (which are usually, 1st, the premises; 2dly, the habendum; 3dly, the tenendum; 4thly, the reddendum; 5thly, the conditions; 6thly, the warranty, which is either lineal or collateral; 7thly, the covenants; 8thly, the conclusion, which includes the date.) 5. Reading it, if desired. 6. Sealing, and, in many cases, signing it also. 7. Delivery. 8. Attestation.

(4.) A deed may be avoided, 1. By the want of any of the requisites before-mentioned. 2. By substantive matter; as, 1st, Rature, or alteration. 2dly, Defacing its seal. 3dly, Cancelling it. 4thly, Disagreement of those whose consent is necessary. 5thly, Judgment of a court of justice.

(5.) Of the several species of deeds, some serve to convey real property, some only to charge and discharge it.

(6.) Deeds which serve to convey real property, or conveyances, are either by common law, or by statute. And, of conveyances by common law, some are original or primary, others derivative or secondary.

(7.) Original conveyances are, 1. Feoffments. 2. Gifts. 3. Grants. 4. Leases. 5. Exchanges. 6. Partitions. Derivative are, 7. Releases. 8. Confirmations. 9. Surrenders. 10. Assignments. 11. Descentances.

(8.) A feoffment is the transfer of any corporeal hereditament to another, perfected by livery of seisin, or delivery of bodily possession from the feoffor to the feoffee; without which no freehold estate therein can be created at common law.

(9.) A gift is properly the conveyance of lands in tail.

(10.) A grant is the regular method, by common law, of conveying incorporeal hereditaments.

(11.) A lease is the demise, granting, or letting to farm of any tenement, usually for a less term than the lessor hath therein; yet sometimes possibly for a greater; according to the regulations of the restraining and enabling statutes.

(12.) An exchange is the mutual conveyance of equal interests, the one in consideration of the other.

(13.) A partition is the division of an estate held in joint-tenancy, in coparcenary, or in common, between the respective tenants; so that each may hold his distinct part in severalty.

(14.) A release is the discharge or conveyance of a man's right, in lands and tenements, to another that hath some former estate in possession therein.

(15.) A confirmation is the conveyance of an estate or right in esse, whereby a voidable estate is made sure, or a particular estate is increased.

(16.) A surrender is the yielding up of an estate for life, or years, to him that hath the immediate remainder or reversion; wherein the particular estate may merge.

(17.) An assignment is the transfer, or making over to another, of the whole right one has in any estate; but usually in a lease, for life or years.

(18.) A descentance is a collateral deed, made at the same time with the original conveyance; contain-

[ d ] ing

Law of  
England,  
analyzed.

Law of  
England  
analyzed.

ing some condition, upon which the estate may be defeated.

(19.) Conveyances by *statute* depend much on the doctrine of *uses and trusts*: which are a confidence reposed in the *terre-tenants*, or tenant of the land, that he shall permit the profits to be enjoyed, according to the directions of *cestuy que use*, or *cestuy que trust*.

(20.) The statute of *uses*, having transferred all uses into actual possession, (or, rather, having drawn the possession to the use), has given birth to divers other species of conveyance: 1. A *covenant* to stand seised to use. 2. A *bargain and sale*, enrolled. 3. A *lease and release*. 4. A *deed to lead or declare* the use of other more direct conveyances. 5. A *revocation of uses*; being the execution of a power, reserved at the creation of the use, of recalling at a future time the use or estate so creating. All which owe their present operation principally to the statute of *uses*.

(21.) Deeds which do not convey, but only charge real property, and discharge it, are, 1. *Obligations*. 2. *Recognizances*. 3. *Disseizances* upon both.

### xxxiii. SECT. XXI. Of alienation by matter of record.

(1.) *ASSURANCES* by matter of record are where the sanction of some court of record is called in, to substantiate and witness the transfer of real property. These are, 1. *Private acts of parliament*. 2. *The king's grants*. 3. *Fines*. 4. *Common recoveries*.

(2.) *Private acts of parliament* are a species of assurances, calculated to give (by the transcendent authority of parliament) such reasonable powers or relief as are beyond the reach of the ordinary course of law.

(3.) *The king's grants*, contained in charters or letters patent, are all entered on record, for the dignity of the royal person, and security of the royal revenue.

(4.) A *fine* (sometimes said to be a feoffment of record) is an amicable composition and agreement of an actual, or fictitious, suit; whereby the estate in question is acknowledged to be the right of one of the parties.

(5.) The *parts* of a fine are, 1. The writ of covenant. 2. The licence to agree. 3. The concord. 4. The note. 5. The foot. To which the statute hath added, 6. Proclamations.

(6.) Fines are of four kinds: 1. *Sur cognizance de droit, come ceo que il ad de son done*. 2. *Sur cognizance de droit tantum*. 3. *Sur concessit*. 4. *Sur done, grant, et render*; which is a double fine.

(7.) The *force and effect* of fines (when levied by such as have themselves any interest in the estate) are to assure the lands in question to the cognizee, by barring the respective rights of parties, privies, and strangers.

(8.) A *common recovery* is by an actual, or fictitious, suit or action for land, brought against the tenant of the freehold; who thereupon vouches another, who undertakes to warrant the tenant's title: but, upon such vouchee's making default, the land is recovered by judgment at law against the tenant; who, in return, obtains judgment against the vouchee to recover lands of equal value in recompense.

(9.) The *force and effect* of a recovery are to assure lands to the recoverer, by barring estates tail, and all

remainders and reversions expectant thereon; provided the tenant in tail either suffers, or is vouched in, such recovery.

(10.) The *uses* of a fine or recovery may be directed by, 1. *Deeds to lead such uses*; which are made previous to the levying or suffering them. 2. *Deeds to declare the uses*; which are made subsequent.

### SECT. XXII. Of alienation by special custom.

lxxxiv.

(1.) *ASSURANCES* by special custom are confined to the transfer of copyhold estates.

(2.) This is effected by, 1. *Surrender* by the tenant into the hands of the lord to the use of another, according to the custom of the manor. 2. *Presentment*, by the tenants or homage, of such surrender. 3. *Admittance* of the surrenderee by the lord, according to the uses expressed in such surrender.

(3.) *Admittance* may also be had upon original grants to the tenant from the lord, and upon descents to the heir from the ancestor.

### SECT. XXIII. Of alienation by devise.

lxxxv.

(1.) *DEVISE* is a disposition of lands and tenements, contained in the last will and testament of the owner.

(2.) This was not permitted by the common law, as it stood since the conquest; but was introduced by the statute law, under Henry VIII. since made more universal by the statute of tenures under Charles II. with the introduction of additional solemnities by the statute of frauds and perjuries in the same reign.

(3.) The *construction* of all common assurances should be, 1. Agreeable to the intention. 2. To the words, of the parties. 3. Made upon the entire deed. 4. Bearing strongest against the contractor. 5. Conformable to law. 6. Rejecting the latter of two totally repugnant clauses in a deed, and the former in a will. 7. Most favourable in case of a devise.

### SECT. XXIV. Of things personal.

lxxxvi.

(1.) *THINGS personal* are comprehended under the general name of *chattels*; which includes whatever wants either the duration, or the immobility, attending things real.

(2.) In these are to be considered, 1. Their *distribution*. 2. The *property* of them. 3. The *title* to that property.

(3.) As to the *distribution* of chattels, they are, 1. *Chattels real*. 2. *Chattels personal*.

(4.) *Chattels real* are such quantities of interest, in things *immoveable*, as are short of the duration of freeholds; being limited to a time certain, beyond which they cannot subsist. (See Sect. 7.)

(5.) *Chattels personal* are things *moveable*; which may be transferred from place to place, together with the person of the owner.

### SECT. XXV. Of property in things personal.

lxxxvii.

(1.) *PROPERTY*, in chattels personal, is either in *possession*, or in *action*.

(2.) Property in *possession*, where a man has the actual enjoyment of the thing, is, 1. *Absolute*. 2. *Qualified*.

(3.) *Absolute* property is where a man has such an exclusive right in the thing, that it cannot cease to be his, without his own act or default.

(4.) *Qua-*

Law of  
England,  
analyzed.

Law of  
England,  
analyzed.

(4.) *Qualified* property is such as is not, in its nature, permanent; but may sometimes subsist, and at other times not subsist.

(5.) This may arise, 1. Where the subject is incapable of absolute ownership. 2. From the peculiar circumstances of the owners.

(6.) Property in *action*, is where a man hath not the actual *occupation* of the thing; but only a *right* to it, arising upon some contract, and recoverable by an action at law.

(7.) The property of chattels personal is liable to remainders, expectant on estates for life; to joint-tenancy; and to tenancy in common.

xxxvii. SECT. XXVI. *Of title to things personal by occupancy.*

(1.) THE *title* to things personal may be acquired or lost by, 1. *Occupancy*. 2. *Prerogative*. 3. *Forfeiture*. 4. *Custom*. 5. *Succession*. 6. *Marriage*. 7. *Judgment*. 8. *Gift*, or grant. 9. *Contract*. 10. *Bankruptcy*. 11. *Testament*. 12. *Administration*.

(2.) Occupancy still gives the first occupant a right to those few things, which have no legal owner, or which are incapable of permanent ownership. Such as, 1. Goods of alien enemies. 2. Things found. 3. The benefit of the elements. 4. Animals *feræ naturæ*. 5. Emblems. 6. Things gained by accession; or, 7. By confusion. 8. Literary property.

xxxix. SECT. XXVII. *Of title by prerogative, and forfeiture.*

(1.) By *prerogative* is vested in the crown, or its grantees, the property of the royal revenue; (see Chap. I. Sect. 8.) and also the property of all game in the kingdom, with the right of pursuing and taking it.

(2.) By *forfeiture*, for crimes and misdemeanours, the right of goods and chattels may be transferred from one man to another; either in part or totally.

(3.) Total forfeitures of goods arise from conviction of, 1. Treason, and misprison thereof. 2. Felony. 3. Excusable homicide. 4. Outlawry for treason or felony. 5. Flight. 6. Standing mute. 7. Assaults on a judge; and batteries, sitting the courts. 8. *Præsumere*. 9. Pretended prophecies. 10. Owling. 11. Residing abroad of artificers. 12. Challenges to fight, for debts at play.

xc. SECT. XXVIII. *Of title by custom.*

(1.) By *custom*, obtaining in particular places, a right may be acquired in chattels: the most usual of which customs are those relating to, 1. *Heriots*. 2. *Mortuaries*. 3. *Heir-looms*.

(2.) *Heriots* are either *heriot-service*, which differs little from a rent; or *heriot-custom*, which is a customary tribute, of goods and chattels, payable to the lord of the fee on the decease of the owner of lands.

(3.) *Mortuaries* are a customary gift, due to the minister in many parishes, on the death of his parishioners.

(4.) *Heir-looms* are such personal chattels, as descend by special custom to the heir, along with the inheritance of his ancestor.

SECT. XXIX. *Of title by succession, marriage, and judgment.*

(1.) By *succession* the right of chattels is vested in corporations *aggregate*; and likewise in such corporations *sole* as are the heads and representatives of bodies aggregate.

(2.) By *marriage* the chattels real and personal of the wife are vested in the husband, in the same degree of property, and with the same powers, as the wife when sole had over them; provided he reduces them to possession.

(3.) The wife also acquires, by *marriage*, a property in her *paraphernalia*.

(4.) By *judgment*, consequent on a suit at law, a man may in some cases, not only *recover*, but originally *acquire*, a right to personal property. As, 1. To penalties recoverable by action popular. 2. To damages. 3. To costs of suit.

SECT. XXX. *Of title by gift, grant, and contract.*

xc.

(1.) A *gift*, or *grant*, is a voluntary conveyance of a chattel personal in possession, without any consideration or equivalent.

(2.) A *contract* is an agreement, upon sufficient consideration, to do or not to do a particular thing; and, by such contract, any personal property (either in possession or in action) may be transferred.

(3.) Contracts may either be express or implied; either executed or executory.

(4.) The *consideration* of contracts is, 1. A good consideration. 2. A valuable consideration; which is, 1. *Do, ut des*. 2. *Facio, ut facias*. 3. *Facio, ut des*. 4. *Do, ut facias*.

(5.) The most usual species of personal contracts are, 1. *Sale* or *exchange*. 2. *Bailment*. 3. *Hiring* or *borrowing*. 4. *Debt*.

(6.) *Sale* or *exchange* is a transmutation of property from one man to another, in consideration of some recompense in value.

(7.) *Bailment* is the delivery of goods in trust; upon a contract, express or implied, that the trust shall be faithfully performed by the bailee.

(8.) *Hiring* or *borrowing* is a contract, whereby the possession of chattels is transferred for a particular time, on condition that the identical goods (or, sometimes, their value) be restored at the time appointed; together with (in case of *hiring*) a stipend or price for the use.

(9.) This price, being calculated to answer the hazard as well as inconvenience of lending, gives birth to the doctrine of *interest*, or *usury*, upon loans; and, consequently, to the doctrine of *bottomry* or *respondentia*, and *insurance*.

(10.) *Debt* is any contract, whereby a certain sum of money becomes due to the creditor. This is, 1. A debt of record. 2. A debt upon *special* contract. 3. A debt upon *simple* contract; which last includes paper credit, or bills of exchange, and promissory notes.

SECT. XXXI. *Of title by bankruptcy.*

xcii.

(1.) BANKRUPTCY (as defined in Sect. 18.) is the  
[ d z ] act

Law of  
England,  
analyzed.

Law of  
England,  
analyzed.

act of becoming a bankrupt.

(2.) Herein may be considered, 1. Who may become a bankrupt. 2. The *acts* whereby he may become a bankrupt. 3. The *proceedings* on a commission of bankrupt. 4. How his *property* is transferred thereby.

(3.) Persons of full age, *using the trade* of merchandize, by buying, and selling, and seeking their livelihood thereby, are liable to become bankrupts; for debts of a sufficient amount.

(4.) A trader, who endeavours to avoid his creditors, or evade their just demands, by any of the ways specified in the several statutes of bankruptcy, doth thereby commit an *act* of bankruptcy.

(5.) The *proceedings* on a commission of bankrupt, so far as they affect the bankrupt himself, are principally by, 1. Petition. 2. Commission. 3. Declaration of bankruptcy. 4. Choice of assignees. 5. The bankrupt's surrender. 6. His examination. 7. His discovery. 8. His certificate. 9. His allowance. 10. His indemnity.

(6.) The *property* of a bankrupt's personal estate is, immediately upon the act of bankruptcy, vested by construction of law in the assignees: and they, when they have collected, distribute the whole by equal dividends among all the creditors.

xciii. SECT. XXXII. *Of title by testament, and administration.*

(1.) CONCERNING *testaments* and *administrations*, considered jointly, are to be observed, 1. Their *original and antiquity*. 2. *Who* may make a testament. 3. Its *nature and incidents*. 4. What are *executors* and *administrators*. 5. Their *office and duty*.

(2.) *Testaments* have subsisted in England immemorially; whereby the deceased was at liberty to dispose of his personal estate, reserving anciently to his wife and children their *reasonable part* of his effects.

(3.) The goods of *intestates* belonged anciently to the king; who granted them to the prelates to be disposed in pious uses: but, on their abuse of this trust in the times of popery, the legislature compelled them to delegate their power to *administrators* expressly provided by law.

(4.) *All persons* may make a testament, unless disabled by, 1. Want of discretion. 2. Want of free-will. 3. Criminal conduct.

(5.) *Testaments* are the legal declaration of a man's intentions, which he wills to be performed after his death. These are, 1. Written. 2. Nuncupative.

(6.) An *executor* is he, to whom a man by his will commits the execution thereof.

(7.) *Administrators* are, 1. *Durante minore etate* of an infant executor or administrator; or *durante absentia*; or *pendente lite*. 2. *Cum testamento annexo*; when no executor is named, or the executor refuses to act. 3. General administrators; in pursuance of the statutes of Edward III. and Henry VIII. 4. Administrators *de bonis non*; when a former executor or administrator dies without completing his trust.

(8.) The *office and duty* of executors, (and, in many points, of administrators also,) are, 1. To bury the deceased. 2. To prove the will, or take out administration. 3. To make an inventory. 4. To collect the goods and chattels. 5. To pay debts; observing

the rules of priority. 6. To pay legacies, either general or specific; if they be vested, and not lapsed. 7. To distribute the undivided surplus, according to the statute of distributions.

C H A P. III.

O F P R I V A T E W R O N G S.

SECT. I. *Of the redress of private wrongs, by the mere act of the parties.* xciv.

(1.) *W* R O N G S are the privation of right; and are, 1. *Private*. 2. *Public*.

(2.) *Private wrongs*, or *civil injuries*, are an infringement, or privation, of the civil rights of individuals, considered as individuals.

(3.) The *redress* of civil injuries is one principal object of the laws of England.

(4.) This *redress* is effected, 1. By the mere *act* of the parties. 2. By the mere *operation of law*. 3. By both together, or *suit in court*.

(5.) *Redress*, by the mere *act* of the parties, is that which arises, 1. From the *sole act* of the party injured. 2. From the *joint act* of all the parties.

(6.) Of the first sort are, 1. Defence of one's self, or relations. 2. Recaption of goods. 3. Entry on lands and tenements. 4. Abatement of nuisances. 5. Distress; for rent, for suit or service, for amercements, for damage, or for divers statutable penalties; —made of such things only as are legally distrainable; —and taken and disposed of according to the due course of law. 6. Seizing of heriots, &c.

(7.) Of the second sort are, 1. Accord. 2. Arbitration.

SECT. II. *Of redress by the mere operation of law.* xcvi.

*REDESS*, effected by the mere *operation of law*, is, 1. In the case of *retainer*; where a creditor is executor or administrator, and is thereupon allowed to retain his own debt. 2. In the case of *remitter*; where one, who has a *good title* to lands, &c. comes into possession by a *bad one*, and is thereupon remitted to his ancient good title, which protects his ill-acquired possession.

SECT. III. *Of courts in general.* xcvi.

(1.) *REDESS*, that is effected by the *act* both of law and of the parties, is by *suit* or *action* in the courts of justice.

(2.) Herein may be considered, 1. The *courts* themselves. 2. The *cognizance* of wrongs, or injuries, therein. And, of *courts*, 1. Their *nature and incidents*. 2. Their several *species*.

(3.) A *court* is a place wherein justice is judicially administered, by officers delegated by the crown; being a court either of record, or not of record.

(4.) *Incident* to all courts are a plaintiff, defendant, and judge: and, with us, there are also usually attorneys; and advocates or counsel, viz. either barristers, or sergeants at law.

SECT. IV. *Of the public courts of common law and equity.* xcvi.

(1.) *Courts of justice*, with regard to their several *species*,

Law of  
England,  
analyzed.

*species*, are, 1. Of a *public*, or general, jurisdiction throughout the realm. 2. Of a *private*, or special, jurisdiction.

(2.) *Public* courts of justice are, 1. The courts of *common law* and *equity*. 2. The *ecclesiastical* courts. 3. The *military* courts. 3. The *maritime* courts.

(3.) The general and public courts of *common law* and *equity* are, 1. The court of *piepoudre*. 2. The court-baron. 3. The hundred court. 4. The county court. 5. The court of common pleas. 6. The court of king's bench. 7. The court of exchequer. 8. The court of chancery. (Which two last are courts of *equity* as well as *law*.) 9. The courts of exchequer-chamber. 10. The house of peers. To which may be added, as auxiliaries, 11. The courts of assize and *nisi prius*.

xcix. SECT. V. *Of courts ecclesiastical, military, and maritime.*

(1.) *ECCLIASTICAL* courts, (which were separated from the *temporal* by William the Conqueror,) or courts *Christianæ*, are, 1. The court of the archdeacon. 2. The court of the bishop's consistory. 3. The court of arches. 4. The court of peculiars. 5. The prerogative court. 6. The court of delegates. 7. The court of review.

(2.) The only permanent *military* court is that of chivalry; the courts martial, annually established by act of parliament, being only temporary.

(3.) *Maritime* courts are, 1. The court of admiralty and vice-admiralty. 2. The court of delegates. 3. The lords of the privy council, and others, authorised by the king's commission, for appeals in prize-causes.

c. SECT. VI. *Of courts of a special jurisdiction.*

COURTS of a special or private jurisdiction are, 1. The forest courts; including the courts of attachments, regard, *swienmote*, and justice-seat. 2. The court of commissioners of sewers. 3. The court of policies of assurance. 4. The court of the marshallsea and the palace court. 5. The courts of the principality of Wales. 6. The court of the duchy-chamber of Lancaster. 7. The courts of the counties palatine, and other royal franchises. 8. The stannery courts. 9. The courts of London, and other corporations:—To which may be referred the courts of requests, or courts of conscience; and the modern regulations of certain courts baron and county courts. 10. The courts of the two universities.

ci. SECT. VII. *Of the cognisance of private wrongs.*

(1.) ALL private wrongs or civil injuries are cognisable either in the courts *ecclesiastical*, *military*, *maritime*, or those of *common law*.

(2.) Injuries cognisable in the *ecclesiastical* courts are, 1. *Pecuniary*. 2. *Matrimonial*. 3. *Testamentary*.

(3.) *Pecuniary* injuries, here cognisable, are, 1. *Subtraction of tithes*. For which the remedy is by suit to compel their payment, or an equivalent; and also their double value. 2. *Nonpayment of ecclesiastical dues*. Remedy: by suit for payment. 3. *Spoilation*. Remedy: by suit for restitution. 4. *Dilapidations*. Remedy: by suit for damages. 5. *Non-repair of the church, &c.*; and *nonpayment of church-rates*. Re-

medy: by suit to compel them.

(4.) *Matrimonial* injuries are, 1. *Falsification of marriage*. Remedy: by suit for perpetual silence. 2. *Subtraction of conjugal rights*. Remedy: by suit for restitution. 3. *Inhabitation for the marriage state*. Remedy: by suit for divorce. 4. *Refusal of decent maintenance to the wife*. Remedy: by suit for alimony.

(5.) *Testamentary* injuries are, 1. *Disputing the validity of wills*. Remedy: by suit to establish them. 3. *Obstructing of administrations*. Remedy: by suit for the granting them. 5. *Subtraction of legacies*. Remedy: by suit for the payment.

(6.) The course of proceedings herein is much conformed to the civil and canon law: but their only compulsive process is that of excommunication; which is enforced by the temporal writ of *significavit*, or *de excommunicato capiendo*.

(7.) Civil injuries, cognisable in the court *military*, or court of chivalry, are, 1. Injuries in point of *honour*. Remedy: by suit for honourable amends. 2. *Encroachments in coat-armour, &c.* Remedy: by suit to remove them. The proceedings are in a summary method.

(8.) Civil injuries cognisable in the courts *maritime*, are injuries, in their nature of common-law cognisance, but arising wholly upon the sea, and not within the precincts of any county. The proceedings are herein also much conformed to the civil law.

(9.) All other injuries are cognisable only in the courts of *common law*: of which in the remainder of this chapter.

(10.) Two of them are, however, commisable by these, and other, inferior courts; viz. 1. *Resfals*, or *neglect*, of justice. Remedies: by writ of *procedendo*, or *mandamus*. 2. *Encroachment of jurisdiction*. Remedy: by writ of prohibition.

SECT. VIII. *Of wrongs, and their remedies, respecting the rights of persons,*

(1.) In treating of the cognisance of injuries by the courts of *common law*, may be considered, 1. The injuries themselves, and their respective remedies. 2. The pursuit of those remedies in the several courts.

(2.) Injuries between subject and subject, cognisable by the courts of *common law*, are in general remedied by putting the party injured into possession of that right whereof he is unjustly deprived.

(3.) This is effected, 1. By *delivery of the thing* detained to the rightful owner. 2. Where that remedy is either impossible or inadequate, by giving the party injured a *satisfaction in damages*.

(4.) The instruments, by which these remedies may be obtained, are *suits* or *actions*; which are defined to be the legal demand of one's right: and these are, 1. *Personal*. 2. *Real*. 3. *Mixed*.

(5.) Injuries (whereof some are with, others without, force), are, 1. Injuries to the rights of *persons*. 2. Injuries to the rights of *property*. And the former are, 1. Injuries to the *absolute*, 2. Injuries to the *relative*, rights of persons.

(6.) The *absolute* rights of individuals are, 1. *Personal security*. 2. *Personal liberty*. 3. *Private property*. (See Chap. I. Sect. 1.) To which the injuries must be correspondent.

Law of  
England,  
analyzed.

Law of  
England,  
analyzed.

Law of  
England,  
analyzed.

(7.) Injuries to *personal security* are, 1. Against a man's *life*. 2. Against his *limbs*. 3. Against his *body*. 4. Against his *health*. 5. Against his *reputation*.—The first must be referred to the next chapter.

(8.) Injuries to the *limbs and body* are, 1. *Threats*. 2. *Affault*. 3. *Battery*. 4. *Wounding*. 5. *Mayhem*. Remedy: by action of trespass, *vi et armis*; for damages.

(9.) Injuries to *health*, by any unwholesome practices, are remedied by a special action of trespass, on the case; for damages.

(10.) Injuries to *reputation* are, 1. Slanderous and malicious *words*. Remedy: by action on the case; for damages. 2. *Libels*. Remedy: the same. 3. Malicious *prosecutions*. Remedy: by action of conspiracy, or on the case; for damages.

(11.) The sole injury to *personal liberty* is *false imprisonment*. Remedies: 1. By writ of, 1st, *Main-prize*; 2dly, *Odio et atia*; 3dly, *Homine replegiando*. 4thly, *Habeas corpus*; to remove the wrong. 2. By action of trespass; to recover damages.

(12.) For injuries to *private property*, see the next section.

(13.) Injuries to *relative rights* affect, 1. *Husbands*. 2. *Parents*. 3. *Guardians*. 4. *Masters*.

(14.) Injuries to an *husband* are, 1. *Abduction*, or taking away his wife. Remedy: by action of trespass, *de uxore rapta et abducta*; to recover possession of his wife, and damages. 2. *Criminal conversation* with her. Remedy: by action on the case; for damages. 3. *Beating* her. Remedy: by action on the case, *per quod consortium amisit*; for damages.

(15.) The only injury to a *parent*, or *guardian*, is the *abduction* of their children or wards. Remedy: by action of trespass, *de filiis, vel custodiis, raptis vel abductis*; to recover possession of them, and damages.

(16.) Injuries to a *master* are, 1. *Retaining* his servants. Remedy: by action on the case; for damages. 2. *Beating* them. Remedy: by action on the case, *per quod servitium amisit*; for damages.

ciii.

#### SECT. IX. Of injuries to personal property.

(1.) INJURIES to the rights of *property* are either to those of *personal*, or *real*, property.

(2.) *Personal property* is either in *possession*, or in *action*.

(3.) Injuries to *personal property* in *possession* are, 1. By *dispossession*. 2. By *damage*, while the owner remains in possession.

(4.) *Dispossession* may be effected, 1. By an *unlawful taking*. 2. By an *unlawful detaining*.

(5.) For the *unlawful taking* of goods and chattels *personal*, the remedy is, 1. *Actual restitution*, which (in case of a wrongful distress) is obtained by action of *replevin*. 3. *Satisfaction* in damages: 1st, in case of *rescous*, by action of *rescous*, poundbreach, or on the case; 2dly, in case of other unlawful takings, by action of trespass, or trover.

(6.) For the *unlawful detaining* of goods lawfully taken, the remedy is also, 1. *Actual restitution*; by action of *replevin*, or *detinue*. 2. *Satisfaction* in damages: by action on the case, for *trover* and *conversion*.

(7.) For *damage* to *personal property*, while in the owner's possession, the remedy is in damages; by ac-

tion of trespass *vi et armis*, in case the act be immediately injurious; or by action of trespass on the case, to redress consequential damage.

(8.) Injuries to *personal property*, in *action*, arise by breach of *contracts*, 1. *Express*. 2. *Implied*.

(9.) Breaches of *express contracts* are, 1. By *nonpayment of debts*. Remedy: 1st, *Specific payment*; recoverable by action of debt. 2dly, *Damages* for nonpayment; recoverable by action on the case. 2. By *nonperformance of covenants*. Remedy: by action of covenant, 1st, to recover damages, in covenants *personal*; 2dly, to compel performance, in covenants *real*. 3. By *nonperformance of promises, or assumpsits*. Remedy: by action on the case; for damages.

(10.) *Implied contracts* are such as arise, 1. From the nature and constitution of *government*. 2. From *reason* and the construction of law.

(11.) Breaches of *contracts*, implied in the nature of *government*, are by the *nonpayment* of money which the laws have directed to be paid. Remedy: by action of debt; (which, in such cases, is frequently a *popular*, frequently a *qui tam*, action) to compel the specific payment: or, sometimes, by action on the case; for damages.

(12.) Breaches of *contracts*, implied in *reason* and construction of law, are by the *nonperformance* of legal presumptive *assumpsits*: for which the remedy is in damages; by an action on the case, on the implied *assumpsits*, 1. Of a *quantum meruit*. 2. Of a *quantum valebat*. 3. Of money expended for another. 4. Of receiving money to another's use. 5. Of an *informal computassent*, on an account stated; (the remedy on an account unstated being by action of account.) 6. Of performing one's duty, in any employment, with integrity, diligence, and skill. In some of which cases an action of deceit (or on the case, in nature of deceit,) will lie.

SECT. X. Of injuries to real property; and, first, of *dispossession*, or *ouster*, of the freehold. civ.

(1.) INJURIES affecting *real property* are, 1. *Ouster*. 2. *Trespass*. 3. *Nuisance*. 4. *Waste*. 5. *Subtraction*. 6. *Disturbance*.

(2.) *Ouster* is the amotion of possession; and is, 1. From *freeholds*. 2. From *chattels*; real.

(3.) *Ouster from freeholds* is effected by, 1. *Abatement*. 2. *Intrusion*. 3. *Disseisin*. 4. *Discontinuance*. 5. *Forfeiture*.

(4.) *Abatement* is the entry of a stranger, after the death of the ancestor, before the heir.

(5.) *Intrusion* is the entry of a stranger, after a particular estate of freehold is determined, before him in remainder or reversion.

(6.) *Disseisin* is a wrongful putting out of him that is seized of the freehold.

(7.) *Discontinuance* is where tenant in tail, or the husband of tenant in fee, makes a larger estate of the land than the law alloweth.

(8.) *Forfeiture* is any other detainer of the freehold from him who hath the property, but who never had the possession.

(9.) The universal remedy for all these is *restitution* or delivery of possession; and, sometimes, damages for the detention. This is effected, 1. By mere *entry*. 2. By action *possessory*. 3. By writ of *right*.

(10.) Mere entry on lands, by him who hath the apparent right of possession, will (if peaceable) devert the mere possession of a wrongdoer. But forcible entries are remedied by immediate restitution, to be given by a justice of the peace.

(11.) Where the wrongdoer hath not only mere possession, but also an apparent right of possession, this may be deverted by him who hath the actual right of possession, by means of the possessory actions of writ of entry, or assize.

(12.) A writ of entry is a real action, which improves the title of the tenant, by shewing the unlawful means under which he gained or continues possession. And it may be brought either against the wrongdoer himself, or in the degrees called the *per*, the *per* and *cui*, and the *post*.

(13.) An assize is a real action, which proves the title of the demandant, by shewing his own, or his ancestor's, possession. And it may be brought either to remedy abatements; viz. the assize of *mort d'ancestor*, &c.: Or to remedy recent disseins; viz. the assize of *novel disseisin*.

(14.) Where the wrongdoer hath gained the actual right of possession, he who hath the right of property can only be remedied by a writ of *right*, or some writ of a similar nature. As, 1. Where such right of possession is gained by the discontinuance of tenant in tail. Remedy, for the right of property: by writ of *formedon*. 2. Where gained by recovery in a possessory action, had against tenants of particular estates by their own default. Remedy: by writ of *quod ei deinceps*. 3. Where gained by recovery in a possessory action, had upon the merits.—4. Where gained by the *statute of limitations*. Remedy, in both cases: by a mere writ of *right*, the highest writ in the law.

cv.

#### SECT. XI. Of dispossession, or ouster, of chattels real.

(1.) OUSTER from chattels real is, 1. From estates by *statute and elegit*. 2. From an estate for years.

(2.) Ouster from estates by *statute or elegit*, is effected by a kind of *disseisin*. Remedy: restitution and damages; by assize of *novel disseisin*.

(3.) Ouster from an estate for years, is effected by a like disseisin, or *ejectment*. Remedy: restitution, and damages; 1. By writ of *ejectione firma*. 2. By writ of *quare ejecit infra terminum*.

(4.) A writ of *ejectione firma*, or action of trespass in ejectment, lieth where lands, &c. are let for a term of years, and the lessee is ousted or ejected from his term; in which case he shall recover possession of his term, and damages.

(5.) This is now the usual method of trying titles to land, instead of an action real: viz. By, 1. The claimant's making an actual (or supposed) lease upon the land to the plaintiff. 2. The plaintiff's actual (or supposed) entry thereupon. 3. His actual (or supposed) ouster and ejectment by the defendant. For which injury this action is brought, either against the tenant, or (more usually) against some casual, or fictitious, ejector; in whose stead the tenant may be admitted defendant, on condition that the lease, entry, and ouster be confessed, and that nothing else be disputed but the merits of the title claimed by the lessor of the plaintiff.

(6.) A writ of *quare ejecit infra terminum* is an action of a similar nature; only not brought against the wrongdoer or ejector himself, but such as are in possession under his title.

#### SECT. XII. Of trespass.

cvi.

TRESPASS is an entry upon, and damage done to, another's lands, by one's self, or one's cattle; without any lawful authority, or cause of justification: which is called a *breach of his close*. Remedy: damages; by action of trespass, *quare clausum fregit*: besides that of distress, damage feasant. But, unless the title to the land came chiefly in question, or the trespass was wilful or malicious, the plaintiff (if the damages be under forty shilling,) shall recover no more costs than damages.

#### SECT. XIII. Of nuisance.

cvii.

(1.) NUISANCE, or annoyance, is any thing that worketh damage or inconvenience: and it is either a public and common nuisance, of which in the next chapter; or, a private nuisance, which is any thing done to the hurt or annoyance of, 1. The corporeal, 2. The incorporeal, hereditaments of another.

(2.) The remedies for a private nuisance, (besides that of abatement,) are, 1. Damages; by action on the case; (which also lies for special prejudice by a public nuisance.) 2. Removal thereof, and damages; by assize of nuisance. 3. Like removal, and damages; by writ of *Quod permittat prosternere*.

#### SECT. XIV. Of waste.

cviii.

(1.) WASTE is a spoil and destruction in lands and tenements, to the injury of him who hath, 1. An immediate interest (as, by right of common) in the lands. 2. The remainder or reversion of the inheritance.

(2.) The remedies, for a commoner, are restitution, and damages; by assize of common: Or, damages only; by action on the case.

(3.) The remedy, for him in remainder, or reversion, is, 1. Preventive: by writ of *estrepement* at law, or injunction out of chancery; to stay waste. 2. Corrective: by action of waste; to recover the place wasted, and damages.

#### SECT. XV. Of subtraction.

cix.

(1.) SUBTRACTION is when one, who owes services to another, withdraws or neglects to perform them. This may be, 1. Of rents, and other services, due by tenure. 2. Of those due by custom.

(2.) For subtraction of rents and services, due by tenure, the remedy is, 1. By distress; to compel the payment, or performance. 2. By action of debt; 3. By assize. 4. By writ of *consecutionibus et servitiis*;—to compel the payment. 5. By writ of *cessavit*;—and, 6. By writ of right *sur disclaimer*;—to recover the land itself.

(3.) To remedy the oppression of the lord, the law has also given, 1. The writ of *Ne injuste vexes*: 2. The writ of *mesne*.

(4.) For subtraction of services, due by custom, the remedy is, 1. By writ of *Seila ad molendinum, furnum, torrale, &c.* to compel the performance, and recovery damages. 2. By action on the case; for damages only.

Law of  
England,  
analyzed.

Law of  
England,  
analyzed.

## SECT. XVI. Of disturbance.

(1.) DISTURBANCE is the hindering, or disquieting, the owners of an incorporeal hereditament, in their regular and lawful enjoyment of it.

(2.) Disturbances are, 1. Of *franchises*. 2. Of *commons*. 3. Of *ways*. 4. Of *tenure*. 5. Of *patronage*.

(3.) Disturbance of *franchises*, is remedied by a special action on the case; for damages.

(4.) Disturbance of *commons*, is, 1. *Intercommoning* without right. Remedy: Damages; by an action on the case, or of trespass: besides distress, damage feasant; to compel satisfaction. 2. *Surcharging* the common. Remedies: Distress, damage feasant; to compel satisfaction: Action on the case; for damages: or, Writ of *admesurement* of pasture; to apportion the common;—and writ of *secunda supererogatione*; for the supererogatory cattle, and damages. 3. *Inclosure*, or obstruction. Remedies: Restitution of the common, and damages; by assise of *novel disseisin*, and by writ of *quod permittat*: or, Damages only; by action on the case.

(5.) Disturbance of *ways*, is the obstruction, 1. Of a way in gross, by the owner of the land. 2. Of a way appendant, by a stranger. Remedy, for both: damages; by action on the case.

(6.) Disturbance of *tenure*, by driving away tenants, is remedied by a special action on the case; for damages.

(7.) Disturbance of *patronage*, is the hindrance of a patron to present his clerk to a benefice; whereof *usurpation*, within six months, is now become a species.

(8.) Disturbers may be, 1. The pseudo-patron, by his wrongful presentation. 2. His clerk, by demanding institution. 3. The ordinary, by refusing the clerk of the true patron.

(9.) The remedies are, 1. By assise of *darrein presentment*; 2. By writ of *quare impedit*;—to compel institution and recover damages: Consequent to which are the writs of *quare incumbravit*, and *quare non admittit*; for subsequent damages. 3. By writ of right of advowson; to compel institution, or establish the permanent right.

## SECT. XVII. Of injuries proceeding from, or affecting, the crown.

(1.) INJURIES to which the crown is a party are, 1. Where the crown is the aggressor. 2. Where the crown is the sufferer.

(2.) The crown is the aggressor, whenever it is in possession of any property to which the subject hath a right.

(3.) This is remedied, 1. By *petition of right*; where the right is grounded on facts disclosed in the petition itself. 2. By *monstrans de droit*; where the claim is grounded on facts, already appearing on record. The effect of both which is to remove the hands (or possession) of the king.

(4.) Where the crown is the sufferer, the king's remedies are, 1. By such common-law actions as are consistent with the royal dignity. 2. By *inquest of office*, to recover possession: which, when found, gives the king his right by solemn matter of record; but

may afterwards be traversed by the subject. 3. By writ of *scire facias*, to repeal the king's patent or grant. 4. By *information of intrusion*, to give damages for any trespass on the lands of the crown; or of *debt*, to recover moneys due upon contract, or forfeited by the breach of any penal statute; or sometimes (in the latter case) by *information in rem*: all filed in the exchequer *ex officio* by the king's attorney-general. 5. By writ of *quo warranto*, or information in the nature of such writ; to seize into the king's hands any franchise usurped by the subject, or to oust an usurper from any public office. 6. By writ of *mandamus*, unless cause; to admit or restore any person intitled to a franchise or office: to which if a false cause be returned, the remedy is by traverse, or by action on the case for damages; and, in consequence, a peremptory *mandamus*, or writ of restitution.

## SECT. XVIII. Of the pursuit of remedies by action; and, first, of the original writ.

(1.) THE pursuit of the several remedies furnished by the laws of England, is, 1. By *action* in the courts of common law. 2. By *proceedings* in the courts of equity.

(2.) Of an *action* in the court of *common pleas* (originally the proper court for prosecuting civil suits) the orderly parts are, 1. The *original writ*. 2. The *process*. 3. The *pleading*. 4. The *issue*, or *demurrer*. 5. The *trial*. 6. The *judgment*. 7. The *proceedings* in nature of appeal. 8. The *execution*.

(3.) The *original writ* is the beginning or foundation of a suit, and is either *optional* (called a *præcipe*), commanding the defendant to do something in certain, or otherwise shew cause to the contrary; or *peremptory*, (called a *fi fecerit te securum*), commanding, upon security given by the plaintiff, the defendant to appear in court, to shew wherefore he hath injured the plaintiff: both issuing out of chancery under the king's great seal, and returnable in bank during term-time.

## SECT. XIX. Of process.

(1.) PROCESS is the means of compelling the defendant to appear in court.

(2.) This includes, 1. *Summons*. 2. The writ of attachment, or *pone*; which is sometimes the first or original process. 3. The writ of *distingas*, or distress infinite. 4. The writs of *capias ad respondendum*, and *testatum capias*: or, instead of these, in the king's bench, the bill of Middlesex, and writ of *latitat*;—and, in the exchequer, the writ of *quo minus*. 5. The *alias* and *pluries* writs. 6. The exigent, or writ of *exigi facias*, proclamations, and outlawry. 7. Appearance, and common bail. 8. The arrest. 9. Special bail, first to the sheriff, and then to the action.

## SECT. XX. Of pleadings.

PLEADINGS are the mutual altercations of the plaintiff and defendant in writing; under which are comprised, 1. The declaration or count; (wherein, incidentally, of the vine, nonuit, retraxit, and discontinuance.) 2. The defence, claim of cognizance, impleading, view,oyer, ad-prayer, voucher, or age; 3. The plea; which is either a *dilatory* plea, (1st, to the jurisdiction; 2dly, in disability of the plaintiff; 3dly, in abatement;) or it is a plea to the action; sometimes

cx.

cxii.

cxlii.

cxli.

cxiv.

times commence the action, either in whole, or in part; (wherein of a tender, paying money into court, and set-off;) but usually denying the complaint, by pleading either, 1st, the general issue; or, 2dly, a special bar; (wherein of justifications, the statutes of limitation, &c.) 4. Replication, rejoinder, surrejoinder, rebutter, surrebutter, &c. Therein of estoppels, colour, duplicity, departure, new assignment, protraction, averment, and other incidents of pleading.

### SECT. XXI. *Of issue and demurrer.*

(1.) *Issue* is where the parties, in a course of pleading, come to a point affirmed on one side and denied on the other: which, if it be a matter of law, is called a *demurrer*; if it be a matter of fact, still retains the name of an *issue*, of fact.

(2.) *Continuance* is the detaining of the parties in court from time to time, by giving them a day certain to appear upon. And, if any new matter arises since the last continuance or adjournment, the defendant may take advantage of it, even after demurrer or issue, by alleging it in a plea *puis darrein continuance*.

(3.) The determination of an issue in law, or demurrer, is by the opinion of the judges of the court; which is afterwards entered on record.

### SECT. XXII. *Of the several species of trial.*

(1.) *TRIAL* is the examination of the matter of fact put in issue.

(2.) The species of trials are, 1. By the record. 2. By inspection. 3. By certificate. 4. By witnesses. 5. By wager of battel. 6. By wager of law. 7. By jury.

(3.) Trial by the record is had, when the existence of such record is the point in issue.

(4.) Trial by inspection or examination is had by the court, principally when the matter in issue is the evident object of the senses.

(5.) Trial by certificate is had in those cases, where such certificate must have been conclusive to a jury.

(6.) Trial by witnesses (the regular method in the civil law) is only used on a writ of dower, when the death of the husband is in issue.

(7.) Trial by wager of battel, in civil cases, is only had on a writ of right: but, in lieu thereof, the tenant may have, at his option, the trial by the grand assize.

(8.) Trial by wager of law is only had, where the matter in issue may be supposed to have been privily transacted, between the parties themselves, without the intervention of other witnesses.

### SECT. XXIII. *Of the trial by jury.*

(1.) *TRIAL* by jury is, 1. Extraordinary; as, by the grand assize, in writs of right; and by the grand jury, in writs of attain. 2. Ordinary.

(2.) The method and process of the ordinary trial by jury is, 1. The writ of *venire facias* to the sheriff, coroners, or elisors; with the subsequent compulsive process of *habeas corpora*, or *distingas*. 2. The carrying down of the record to the court of *nisi prius*. 3. The sheriff's return; or panel of, 1st, special, 2dly, common jurors. 4. The challenges; 1st, to the array; 2dly, to the polls of the jurors; either, *propter bonoris respectum*, *propter defectum*, *propter affectum*

(which is sometimes a principal challenge, sometimes to the favour,) or *propter delictum*. 5. The *tales de circumstantibus*. 6. The oath of the jury. 7. The evidence; which is either by proofs, 1st, written; 2dly, parol;—or, by the private knowledge of the jurors. 6. The verdict; which may be, 1st, privy; 2dly, public; 3dly, special.

### SECT. XXIV. *Of judgment; and its incidents.*

cxviii.

(1.) *WHATEVER* is transacted at the trial, in the court of *nisi prius*, is added to the record under the name of a *posse*; consequent upon which is the judgment.

(2.) Judgment may be *arrested* or *stayed* for causes, 1. Extrinsic, or *dehors* the record; as in the case of *new trials*. 2. Intrinsic, or within it; as where the declaration varies from the writ, or the verdict from the pleadings, and issue; or where the case, laid in the declaration, is not sufficient to support the action in point of law.

(3.) Where the issue is immaterial, or insufficient, the court may award a *repleader*.

(4.) Judgment is the sentence of the law, pronounced by the court, upon the matter contained in the record.

(5.) Judgments are, 1. Interlocutory; which are incomplete till perfected by a writ of inquiry. 2. Final.

(6.) *Costs*, or expences of suit, are now the necessary consequence of obtaining judgment.

### SECT. XXV. *Of proceedings, in the nature of appeals.*

cxix.

(1.) *PROCEEDINGS*, in the nature of appeals from judgment, are, 1. A writ of *attaint*; to impeach the verdict of a jury; which of late has been superseded by new trials. 2. A writ of *audita querela*; to discharge a judgment by matter that has since happened. 3. A writ of *error*, from one court of record to another; to correct judgments, erroneous in point of law, and not helped by the statutes of amendment and jeofails.

(2.) Writs of error lie, 1. To the court of king's bench, from all inferior courts of record; from the court of common-pleas at Westminster; and from the court of king's bench in Ireland. 2. To the courts of exchequer-chamber, from the law side of the court of exchequer; and from proceedings in the court of king's bench by bill. 3. To the house of peers, from proceedings in the court of king's bench by original, and on writs of error; and from the several courts of exchequer-chamber.

### SECT. XXVI. *Of execution.*

cxx.

*EXECUTION* is the putting in force of the sentence or judgment of the law. Which is effected, 1. Where possession of any hereditament is recovered: by writ of *habere facias seisinam, possessionem, &c.* 2. Where any thing is awarded to be done or rendered, by a special writ for that purpose: as, by writ of abatement, in case of nuisance; *retorno habendo*, and *capias in withernam*, in replevin; *distingas* and *scire facias*, in detinue. 3. Where money only is recovered; by writ of, 1st, *capias ad satisfaciendum*, against the body of the defendant; or, in default thereof, *scire facias*

[ c ] cias

cxv.

cxvi.

cxvii.

England,  
analyzed.

*cias* against his bail. 2dly, *Fieri facias*, against his goods and chattels. 3dly, *Levari facias*, against his goods and the profits of his lands. 4thly, *Elegit*, against his goods, and the possession of his lands. 5thly, *Extendi facias*, and other process, on statutes, recognizances, &c. against his body, lands, and goods.

cxli. SECT. XXVII. *Of proceedings in the courts of equity.*

(1.) MATTERS of equity which belong to the peculiar jurisdiction of the court of *chancery*, are, 1. The guardianship of infants. 2. The custody of idiots and lunatics. 3. The superintendence of charities. 4. Commisions of bankrupt.

(2.) The court of *exchequer* and the duchy-court of *Lancaster*, have also some peculiar causes, in which the interest of the king is more immediately concerned.

(3.) *Equity* is the true sense and sound interpretation of the rules of law; and, as such, is equally attended to by the judges of the courts both of common law and equity.

(4.) The essential differences, whereby the English courts of equity are distinguished from the courts of law, are, 1. The mode of *proof*, by a discovery on the oath of the party; which gives a jurisdiction in matters of account, and fraud. 2. The mode of *trial*; by depositions taken in any part of the world. 3. The mode of *relief*; by giving a more specific and extensive remedy than can be had in the courts of law; as, by carrying agreements into execution, staying waste or other injuries by injunction, directing the sale of incumbered lands, &c. 4. The true construction of *securities* for money, by considering them merely as a pledge. 5. The execution of *trusts*, or second uses, in a manner analogous to the law of legal estates.

(5.) The proceedings in the court of *chancery*, (to which those in the *exchequer*, &c. very nearly conform,) are, 1. Bill. 2. Writ of *subpœna*; and, perhaps, injunction. 3. Process of contempt; viz. (ordinarily) attachment, attachment with proclamations, commission of rebellion, serjeant at arms, and sequestration. 4. Appearance. 5. Demurrer. 6. Plea. 7. Answer. 8. Exceptions; amendments; cross, or supplemental, bills; bills of revivor, interpleader, &c. 9. Replication. 10. Issue. 11. Depositions, taken upon interrogatories; and subsequent publication thereof. 12. Hearing. 13. Interlocutory decree; feigned issue, and trial; reference to the master, and report; &c. 14. Final decree. 15. Rehearing, or bill of review. 16. Appeal to parliament.

CHAP. IV.

OF PUBLIC WRONGS.

cxliii. SECT. I. *Of the nature of crimes, and their punishment.*

(1.) IN treating of *public wrongs* may be considered, 1. The general nature of crimes and punishments. 2. The persons capable of committing crimes. 3. Their several degrees of guilt. 4. The several species of crimes, and their respective punishments. 5. The means of prevention. 6. The method of punishment.

(2.) A *crime*, or *misdemeanour*, is an act committed, or omitted, in violation of a public law either forbidding or commanding it.

(3.) Crimes are distinguished from civil injuries, in that they are a breach and violation of the public rights, due to the whole community, considered as a community.

(4.) *Punishments* may be considered with regard to, 1. The power; 2. The end; 3. The measure;—of their infliction.

(5.) The power, or right, of inflicting human punishments for natural crimes, or such as are *mala in se*, was by the law of nature vested in every individual: but, by the fundamental contract of society, is now transferred to the sovereign power; in which also is vested, by the same contract, the right of punishing positive offences, or such as are *mala prohibita*.

(6.) The end of human punishments is to prevent future offences; 1. By amending the offender himself. 2. By deterring others through his example. 3. By depriving him of the power to do future mischief.

(7.) The measure of human punishments must be determined by the wisdom of the sovereign power, and not by any uniform universal rule: though that wisdom may be regulated, and assisted, by certain general, equitable, principles.

SECT. II. *Of the persons capable of committing crimes.*

cxiv.

(1.) ALL persons are capable of committing crimes unless there be in them a *defect of will*: for, to constitute a legal crime, there must be both a vicious will, and a vicious act.

(2.) The will does not concur with the act, 1. Where there is a defect of understanding. 2. Where no will is exerted. 3. Where the act is constrained by force and violence.

(3.) A vicious will may therefore be wanting, in the cases of, 1. Infancy. 2. Idiocy, or lunacy. 3. Drunkenness; which doth not, however, excuse. 4. Misfortune. 5. Ignorance, or mistake of fact. 6. Compulsion, or necessity; which is, 1st, that of civil subjection; 2dly, that of duress *per minas*; 3dly, that of choosing the least pernicious of two evils, where one is unavoidable; 4thly, that of want, or hunger; which is no legitimate excuse.

(4.) The king, from his excellence and dignity, is also incapable of doing wrong.

SECT. III. *Of principals and accessories.*

cxv.

(1.) The different degrees of guilt in criminals are, 1. As principals. 2. As accessories.

(2.) A principal in a crime is, 1. He who commits the fact. 2. He who is present at, aiding, and abetting, the commission.

(3.) An accessory is he who doth not commit the fact, nor is present at the commission; but is in some sort concerned therein, either before or after.

(4.) Accessories can only be in petit treason, and felony: in high treason, and misdemeanours, all are principals.

(5.) An accessory, before the fact, is one who, being absent when the crime is committed, hath procured, counselled, or commanded, another to commit it.

(6.) An

Law of  
England,  
analyzed.Law of  
England,  
analyzed.

(6.) An accessory *after the fact*, is where a person, knowing a felony to have been committed, receives, relieves, comforts, or assists, the felon. Such accessory is usually entitled to the benefit of clergy; where the principal, and accessory *before the fact*, are excluded from it.

CXXVI.

#### SECT. IV. *Of offences against God and religion.*

(1.) CRIMES and misdemeanours cognizable by the laws of England are such as more immediately offend, 1. God, and his holy religion. 2. The law of nations. 3. The king, and his government. 4. The public, or commonwealth. 5. Individuals.

(2.) Crimes more immediately offending God and religion are, 1. *Apostasy*. For which the penalty is incapacity, and imprisonment. 2. *Heresy*. Penalty, for one species thereof: the same. 3. Offences against the established church:—Either, by *neglecting its ordinances*. Penalties: fine; deprivation; imprisonment; forfeiture.—Or, by *nonconformity to its worship*: 1st, *Three* total *irreligion*. Penalty: fine. 2dly, *Three* protestant *dissentings*. Penalty: suspended by the toleration act. 3dly, *Through popery*, either in professors of the popish religion, popish recusants, convict, or popish priests. Penalties: incapacity; double taxes; imprisonment; fines; forfeitures; abjuration of the realm; judgment of felony, without clergy; and judgment of high treason. 4. *Blasphemy*. Penalty: fine, imprisonment, and corporal punishment. 5. *Prophane swearing and cursing*. Penalty: fine, or house of correction. 6. *Witchcraft*; or, at least, the pretence thereto. Penalty: imprisonment, and pillory. 7. *Religious imposture*. Penalty: fine, imprisonment, and corporal punishment. 8. *Simony*. Penalties: forfeiture of double value; incapacity. 9. *Sabbath-breaking*. Penalty: fine. 10. *Drunkenness*. Penalty: fine, or stocks. 11. *Lewdness*. Penalties: fine; imprisonment; house of correction.

CXXVII.

#### SECT. V. *Of offences against the law of nations.*

(1.) The law of nations is a system of rules, deducible by natural reason, and established by universal consent, to regulate the intercourse between independent states.

(2.) In England, the law of nations is adopted in its full extent, as part of the law of the land.

(3.) Offences against this law are principally incident to whole states or nations; but, when committed by private subjects, are then the objects of the municipal law.

(4.) Crimes against the law of nations, animated on by the laws of England, are, 1. Violation of *safu-conducts*. 2. Infringement of the rights of *ambassadors*. Penalty, in both: arbitrary. 3. *Piracy*. Penalty: judgment of felony, without clergy.

CXXVIII.

#### SECT. VI. *Of high treason.*

(1.) CRIMES and misdemeanours more peculiarly offending the king and his government are, 1. *High treason*. 2. *Felonies* injurious to the prerogative. 3. *Præmunire*. 4. Other *misprisions and contempts*.

(2.) *High treason* may, according to the Statute of Edward III. be committed, 1. By *compassing or imagining the death of the king, or queen-consort, or their eldest son and heir; demonstrated by some overt act,*

2. By *violating the king's company; his eldest daughter, or the wife of his eldest son.* 3. By some overt act of *levying war against the king in his realm.* 4. By *adherence to the king's enemies.* 5. By *counterfeiting the king's great or privy seal.* 6. By *counterfeiting the king's money, or importing counterfeit money.* 7. By *killing the chancellor, treasurer, or king's justices, in the execution of their offices.*

(3.) *High treasons*, created by subsequent statutes, are such as relate, 1. To *papists*: as, the repeated defence of the Pope's jurisdiction; the coming from beyond sea of a natural-born Popish priest; the renouncing of allegiance, and reconciliation to the Pope or other foreign power. 2. To the *coinage*, or other sign, nature of the king: as, counterfeiting (or, importing and uttering counterfeit) foreign coins, here current; forging the sign manual, privy signet, or privy seal; falsifying, &c. the current coin. 3. To the *protestant succession*: as, corresponding with, or remitting to, the late Pretender's sons; endeavouring to impede the succession; writing or printing, in defence of any Pretender's title, or in derogation of the act of settlement, or of the power of parliament to limit the descent of the crown.

(4.) The punishment of high treason, in *males*, is (generally) to be, 1. Drawn. 2. Hanged. 3. Embowelled alive. 4. Beheaded. 5. Quartered. 6. The head and quarters to be at the king's disposal. But, in treasons relating to the coin, only to be drawn, and hanged till dead. *Females*, in both cases, are to be drawn, and burned alive.

#### SECT. VII. *Of felonies injurious to the king's prerogative.*

CXXIX.

(1.) FELONY is that offence which occasions the total forfeiture of lands or goods at common law; now usually also punishable with death, by hanging; unless through the benefit of clergy.

(2.) *Felonies* injurious to the king's prerogative (of which some are within, others without, clergy) are, 1. Such as relate to the *coin*: as, the wilful uttering of counterfeit money, &c.; (to which head some inferior misdemeanours affecting the coinage may be also referred). 2. Conspiring or attempting to kill a *privy counsellor*. 3. Serving *foreign states*, or enlisting soldiers for foreign service. 4. Embezzling the king's *armour or stores*. 5. *Desertion* from the king's *armies*, by land or sea.

#### SECT. VIII. *Of præmunire.*

CXXX.

(1.) PRÆMUNIRE, in its original sense, is the offence of adhering to the temporal power of the Pope, in derogation of the regal authority. Penalty: outlawry, forfeiture, and imprisonment: which hath since been extended to some offences of a different nature.

(2.) Among these are, 1. Importing Popish *trinkets*. 2. Contributing to the maintenance of Popish seminaries abroad, or Popish priests in England. 3. Molesting the possessors of *abbey-lands*. 4. Acting as broker in an usurious contract, for more than ten per cent. 5. Obtaining any *stay of proceedings* in suits for monopolies. 6. Obtaining an exclusive patent for gunpowder or arms. 7. Exertion of purveyance or pre-emption. 8. Asserting a legislative authority in both or either house of parliament. 9. Sending any subjects

subject a prisoner beyond sea. 10. Refusing the oaths of allegiance and supremacy. 11. Preaching, teaching, or advised speaking, in defence of the right of any pretender to the crown, or in derogation of the power of parliament to limit the succession. 12. Treating of other matters, by the assembly of peers of Scotland, convened for electing their representatives in parliament. 15. Unwarrantable undertakings by unlawful subscriptions to public funds.

cxxx.

### SECT. IX. *Of misprisions and contempts affecting the king and government.*

(1.) MISPRISIONS and contempts are all such high offences as are under the degree of capital.

(2.) These are, 1. *Negative*, in concealing what ought to be revealed. 2. *Positive*, in committing what ought not to be done.

(3.) *Negative* misprisions are, 1. Misprision of *treason*. Penalty: forfeiture and imprisonment. 2. Misprision of *felony*. Penalty: fine and imprisonment. 3. Concealment of *treasure trove*. Penalty: fine and imprisonment.

(4.) *Positive* misprisions, or high misdemeanors and contempts, are, 1. *Mal-administration* of public trusts, which includes the crime of *peculation*. Usual penalties: banishment; fines; imprisonment; disability. 2. Contempts against the king's *prerogative*. Penalty: fine, and imprisonment. 3. Contempt against his *person and government*. Penalty: fine, imprisonment, and infamous corporal punishment. 4. Contempts against his *title*. Penalties: fine, and imprisonment; or fine, and disability. 5. Contempts against his *palaces, or courts of justice*. Penalties: fine; imprisonment; corporal punishment; loss of right hand; forfeiture.

cxxxii.

### SECT. X. *Of offences against public justice.*

(1.) CRIMES especially affecting the *commonwealth* are offences, 1. Against the *public justice*. 2. Against the *public peace*. 3. Against the *public trade*. 4. Against the *public health*. 5. Against the *public police or economy*.

(2.) Offences against the *public justice*, are, 1. *Embezzling* or *vacating* records, and *personating* others in courts of justice. Penalty: judgment of felony, usually without clergy. 2. *Compelling* prisoners to become *approvers*. Penalty: judgment of felony.—3. *Obstructing* the execution of process. 4. *Escapes*. 5. *Breach* of prison. 6. *Refuse*.—Which four may, (according to the circumstances), be either felonies, or misdemeanors punishable by fine and imprisonment. 7. *Returning* from *transportation*. This is felony, without clergy. 8. Taking *rewards*, to help one to his stolen goods. Penalty: the same as for the theft. 9. *Receiving* stolen goods. Penalties: transportation; fine; and imprisonment.—10. *Theftbote*. 11. Common *barretry*, and suing in a feigned name. 12. *Maintenance*. 13. *Champerty*. Penalty, in these four: fine, and imprisonment. 14. *Compounding* prosecutions on penal statutes. Penalty: fine, pillory, and disability. 15. *Conspiracy*; and threats of accusation in order to extort money, &c. Penalties: the villenous judgment; fine; imprisonment; pillory; whipping; transportation. 16. *Perjury*, and subornation thereof. Penalties: infamy; imprisonment; fine, or pillory; and, sometimes, transportation or house of correction. 17. *Bri-*

*bery*. Penalty: fine, and imprisonment. 18. *Embracery*. Penalty: infamy, fine, and imprisonment. 19. *False verdict*. Penalty: the judgment in attaint. 20. *Negligence* of public officers, &c. Penalty: fine, and forfeiture of the office. 21. *Oppression* by magistrates. 22. *Extortion* of officers. Penalty, in both: imprisonment, fine, and sometimes forfeiture of the office.

### SECT. XI. *Of offences against the public peace.*

cxxxiii.

OFFENCES against the public peace are, 1. *Riotous assemblies* to the number of twelve. 2. Appearing armed, or hunting in *disguise*. 3. *Threatening*, or *demanding* any valuable thing, by letter.—All these are felonies, without clergy. 4. *Destruction* of *turnpikes*, &c. Penalties: whipping; imprisonment; judgment of felony, with and without clergy.—5. *Affrays*. 6. *Riots, routs*, and *unlawful assemblies*. 7. *Tumultuous petitioning*. 8. *Forcibly entry*, and *detainer*. Penalty, in all four: fine, and imprisonment. 9. *Going unusually armed*. Penalty: forfeiture of arms, and imprisonment. 10. *Spreading false news*. Penalty: fine, and imprisonment. 11. *Pretended prophecies*. Penalties: fine; imprisonment; and forfeiture. 12. *Challenges* to fight. Penalty: fine, imprisonment, and sometimes forfeiture. 13. *Libels*. Penalty: fine, imprisonment, and corporal punishment.

### SECT. XII. *Of offences against public trade.*

cxxxiv.

OFFENCES against the public trade, are, 1. *Swearing*. Penalties: fines; forfeiture; imprisonment; loss of left hand; transportation; judgment of felony. 2. *Smuggling*. Penalties: fines; loss of goods; judgment of felony, without clergy. 3. *Fraudulent bankruptcy*. Penalty: judgment of felony without clergy. 5. *Urgery*. Penalty: fine, and imprisonment. 5. *Cheating*. Penalties: fine; imprisonment; pillory; tumbrel; whipping; or other corporal punishment; transportation.—6. *Forestalling*. 7. *Regrating*. 8. *Engrossing*. Penalties, for all three: loss of goods; fine; imprisonment; pillory. 9. *Monopolies*, and combinations to raise the price of commodities. Penalties: fines; imprisonment; pillory; loss of ear; infamy; and, sometimes, the pains of *praemunire*. 10. *Exercising a trade*, not having served as an apprentice. Penalty; fine. 11. *Transporting*, or residing abroad, of *artificers*. Penalties: fine; imprisonment; forfeiture; incapacity; becoming aliens.

### SECT. XIII. *Of offences against the public health, and the public police or economy.*

cxxxv.

(1.) OFFENCES against the public health are, 1. *Irregularity*, in the time of the *plague*, or of *quarantine*. Penalties: whipping; judgment of felony, with and without clergy. 2. Selling *unwholesome provisions*. Penalties: amercement; pillory; fine; imprisonment; abjuration of the town.

(2.) Offences against the public police and economy or domestic order of the kingdom, are, 1. Those relating to *clandestine* and *irregular marriages*. Penalties: judgment of felony, with and without clergy. 2. *Bigamy*, or (more properly) *polygamy*. Penalty: judgment of felony.—3. *Wandering*, by *soldiers* or *mariners*. 4. *Remaining* in England, by *Egyptians*; or being in their *fellowship* one month. Both these are felonies, without clergy. 5. *Common nuisances*, 1st, by annoy-

Law of  
England,  
analyzed.

annoyances or purpessures in highways, bridges, and rivers; *adly*, by offensive trades and manufactures; *3dly*, by disorderly houses; *4thly*, by lotteries; *5thly*, by cottages; *6thly*, by fireworks; *7thly*, by eveldropping. Penalty, in all; fine.—*8thly*, By common scolding. Penalty: the cucking stool. 6. *Idleness, disorder, vagrancy, and incorrigible roguery*. Penalties: imprisonment; whipping; judgment of felony. 7. *Luxury*, in diet. Penalty, discretionary. 8. *Gaming*. Penalties: to gentlemen, fines; to others, fine and imprisonment; to cheating gamblers, fine, infamy, and the corporal pains of perjury. 9. *Destroying the game*. Penalties: fines, and corporal punishment.

#### SECT. XIV. *Of homicide.*

cxxxv.

(1.) CRIMES especially affecting individuals are, 1. Against their persons. 2. Against their habitations. 3. Against their property.

(2.) Crimes against the persons of individuals, are, 1. By homicide, or destroying life. 2. By other corporal injuries.

(3.) Homicide is, 1. Justifiable. 2. Excusable. 3. Felonious.

(4.) Homicide is justifiable, 1. By necessity, and command of law. 2. By permission of law; *1st*, for the furtherance of public justice; *adly*, for prevention of some forcible felony.

(5.) Homicide is excusable, 1. *Per infortunium*, or by misadventure. 3. *Se defendendo*, or in self-defence, by chance-medley. Penalty, in both: forfeiture of goods; which however is pardoned of course.

(6.) Felonious homicide is the killing of a human creature without justification or excuse. This is, 1. Killing one's self. 2. Killing another.

(7.) Killing one's self, or self-murder, is where one deliberately, or by any unlawful malicious act, puts an end to his own life. This is felony; punished by ignominious burial, and forfeiture of goods and chattels.

(8.) Killing another is, 1. Manslaughter. 2. Murder.

(9.) Manslaughter is the unlawful killing of another, without malice, express or implied. This is either, 1. Voluntary, upon a sudden heat. 2. Involuntary, in the commission of some unlawful act. Both are felony, but within clergy; except in the case of *stabbing*.

(10.) Murder is when a person, of sound memory and discretion, unlawfully killeth any reasonable creature, in being, and under the king's peace; with malice aforethought, either express or implied. This is felony, without clergy; punished with speedy death, and hanging in chains, or dissection.

(11.) Petit treason (being an aggravated degree of murder) is where the servant kills his master, the wife her husband, or the ecclesiastic his superior. Penalty: in men, to be drawn and hanged; in women, to be drawn and burned.

cxxxvii.

#### SECT. XV. *Of offences against the persons of individuals.*

CRIMES affecting the persons of individuals, by other corporal injuries not amounting to homicide, are, 1. *Mayhem*; and also *shooting* at another. Penalties: fine; imprisonment; judgment of felony, without cler-

gy. 2. *Forcible abduction, and marriage or defilement*, of an heiress; which is felony: also, *stealing, and deflowering or marrying*, any woman-child under the age of sixteen years; for which the penalty is imprisonment, fine, and temporary forfeiture of her lands.—3. *Rape*, and also *carnal knowledge*, of a woman-child under the age of ten years. 4. *Buggery*, with man or beast. Both these are felonies, without clergy.—5. *Assault*. 6. *Battery*; especially of clergymen. 7. *Wounding*. Penalties, in all three: fine; imprisonment; and other corporal punishment. 8. *False imprisonment*. Penalties: fine; imprisonment; and (in some atrocious cases) the pains of *premunire*, and incapacity of office or pardon. 9. *Kidnapping*, or forcibly stealing away the king's subjects. Penalty: fine; imprisonment; and pillory.

#### SECT. XVI. *Of offences against the habitations of individuals.*

cxxxviii.

(1.) CRIMES, affecting the habitation of individuals, are, 1. Arson. 2. Burglary.

(2.) Arson is the malicious and wilful burning of the house, or out-house, of another man. This is felony; in some cases within, in others without, clergy.

(3.) Burglary is the breaking and entering, by night, into a mansion-house; with intent to commit a felony. This is felony, without clergy.

#### SECT. XVII. *Of offences against private property.*

cxxxix.

(1.) CRIMES affecting the private property of individuals are, 1. Larceny. 2. Malicious mischief. 3. Forgery.

(2.) Larceny is, 1. Simple. 2. Mixed, or compound.

(3.) Simple larceny is the felonious taking, and carrying away, of the personal goods of another. And it is, 1. Grand larceny; being above the value of twelve pence. Which is felony; in some cases within, in others without, clergy. 2. Petit larceny; to the value of twelve pence or under. Which is also felony, but not capital; being punished with whipping, or transportation.

(4.) Mixed, or compound, larceny is that wherein the taking is accompanied with the aggravation of being, 1. From the house. 2. From the person.

(5.) Larcinies from the house, by day or night, are felonies without clergy, when they are, 1. Larcinies, above twelve pence, from a church;—or by breaking a tent or booth in a market or fair, by day or night, the owner or his family being therein;—or by breaking a dwelling-house by day, any person being therein;—or from a dwelling-house by day, without breaking, any person therein being put in fear;—or from a dwelling-house by night, without breaking, the owner or his family being therein and put in fear. 2. Larcinies, of five shillings, by breaking the dwelling-house, shop, or warehouse, by day, though no person be therein;—or, by privately stealing in any shop, warehouse, coach-house, or stable, by day or night, without breaking, and though no person be therein. 3. Larcinies, of forty shillings, from a dwelling-house or its out-houses, without breaking, and though no person be therein.

(6.) Larceny from the person is, 1. By privately stealing, from the person of another, above the value of twelve pence. 2. By robbery; or the felonious and forcible

Law of  
England,  
analyzed.

Law of  
England  
analyzed,

Law of  
England,  
analyzed.

forcible taking, from the person of another, in or near the highway, goods or money of any value, by putting him in fear. These are both felonies without clergy. An attempt to rob is also felony.

(7.) *Malicious mischief*, by destroying dikes, goods, cattle, ships, garments, fishpounds, trees, woods, churches, chapels, meeting-houses, houses, out-houses, corn, hay, straw, sea or river banks, hopbinds, coal-mines (or engines thereunto belonging), or any fences for inclosures by act of parliament, is felony; and, in most cases, without benefit of clergy.

(8.) *Forgery* is the fraudulent making or alteration of a writing, in prejudice of another's right. Penalties: fine; imprisonment; pillory; loss of nose and ears; forfeiture; judgment of felony, without clergy.

cxl. **SECT. XVIII. Of the means of preventing offences.**

(1.) CRIMES and misdemeanors may be prevented, by compelling suspected persons to give security: which is effected by binding them in a conditional recognizance to the king, taken in court, or by a magistrate.

(2.) These recognizances may be conditioned, 1. To keep the peace. 2. To be of the good behaviour.

(3.) They may be taken by any justice or conservator of the peace, at his own discretion; or, at the request of such as are intitled to demand the same.

(4.) All persons, who have given sufficient cause to apprehend an intended breach of the peace, may be bound over to keep the peace; and all those, that be not of good fame, may be bound to the good behaviour; and may, upon refusal in either case, be committed to gaol.

cxli. **SECT. XIX. Of courts of a criminal jurisdiction.**

(1.) Is the method of punishment may be considered, 1. The several courts of criminal jurisdiction. 2. The several proceedings therein.

(2.) The criminal courts are, 1. Those of a public and general jurisdiction throughout the realm. 2. Those of a private and special jurisdiction.

(3.) Public criminal courts are, 1. The high court of parliament; which proceeds by impeachment. 2. The court of the lord high steward; and the court of the king in full parliament: for the trial of capitally indicted peers. 3. The court of king's bench. 4. The court of chivalry. 5. The court of admiralty, under the king's commission. 6. The courts of oyer and terminer, and general goal-delivery. 7. The court of quarter-sessions of the peace. 8. The sheriff's tourn. 9. The court leet. 10. The court of the coroner. 11. The court of the clerk of the market.

(4.) Private criminal courts are, 1. The court of the lord steward, &c. by statute of Henry VII. 2. The court of the lord steward, &c. by statute of Henry VIII. 3. The university courts.

cxlii. **SECT. XX. Of summary convictions.**

(1.) PROCEEDINGS in criminal courts are, 1. Summary. 2. Regular.

(2.) Summary proceedings are such, whereby a man may be convicted of divers offences, without any formal process or jury, at the discretion of the judge or

judges appointed by act of parliament, or common law.

(3.) Such are, 1. Trials of offences and frauds against the laws of excise and other branches of the king's revenue. 2. Convictions before justices of the peace upon a variety of minute offences, chiefly against the public police. 3. Attachments for contempts to the superior courts of justice.

**SECT. XXI. Of arrests.**

cxliii.

(1.) REGULAR proceedings in the courts of common law, are, 1. Arrest. 2. Commitment and bail. 3. Prosecution. 4. Process. 5. Arraignment, and its incidents. 6. Plea and issue. 7. Trial and conviction. 8. Clergy. 9. Judgment, and its consequences. 10. Reversal of judgment. 11. Reprieve or pardon. 12. Execution.

(2.) An arrest is the apprehending, or restraining, of one's person; in order to be forthcoming to answer a crime whereof one is accused or suspected.

(3.) This may be done, 1. By warrant. 2. By an officer, without warrant. 3. By a private person, without warrant. 4. By hue and cry.

**SECT. XXII. Of commitment and bail.**

cxliv.

(1.) COMMITMENT is the confinement of one's person in prison, for safe custody, by warrant from proper authority; unless, in bailable offences, he puts in sufficient bail, or security for his future appearance.

(2.) The magistrate is bound to take reasonable bail, if offered; unless the offender be not bailable.

(3.) Such are, 1. Persons accused of treason; or, 2. Of murder; or, 3. Of manslaughter, by indictment; or if the prisoner was clearly the slayer. 4. Prison-breakers, when committed for felony. 5. Outlaws. 6. Those who have abjured the realm. 7. Approvers, and appellers. 8. Persons taken with the mainour. 9. Persons accused of arson. 10. Excommunicated persons.

(4.) The magistrate may, at his discretion, admit to bail, or otherwise, persons not of good fame, charged with other felonies, whether as principals or as accessories.

(5.) If they be of good fame, he is bound to admit them to bail.

(6.) The court of king's bench, or its judges in time of vacation, may bail in any case whatsoever.

**SECT. XXIII. Of the several modes of prosecution.**

cxlv.

(1.) PROSECUTION, or the manner of accusing offenders, is either by a previous finding of a grand jury; as, 1. By presentment. 2. By indictment. Or, without such finding, 3. By information. 4. By appeal.

(2.) A presentment is the notice taken by a grand jury of any offence, from their own knowledge or observation.

(3.) An indictment is a written accusation of one or more persons of a crime or misdemeanor, preferred to, and presented on oath by, a grand jury; expressing, with sufficient certainty, the person, time, place, and offence.

(4.) An information is, 1. At the suit of the king and a subject, upon penal statutes. 4. At the suit of the

Law of  
England,  
analyzed.

the king only. Either, 1. Filed by the attorney-general *ex officio*, for such misdemeanours as affect the king's person or government; or, 2. Filed by the master of the crown-office (with leave of the court of king's bench) at the relation of some private subject, for other gross and notorious misdemeanours. All differing from indictments in this; that they are exhibited by the informer, or the king's officer; and not on the oath of a grand jury.

(5.) An *appeal* is an accusation or suit, brought by one private subject against another, for larciny, rape, mayhem, arson, or homicide; which the king cannot discharge or pardon, but the party alone can release.

calvi. **SECT. XXIV. Of process upon an indictment.**

(1.) PROCESS to bring in an offender, when indicted in his absence, is, in misdemeanours, by *venire facias*, distress infinite, and *capias*; in capital crimes, by *capias* only; and, in both, by outlawry.

(2.) During this stage of proceedings, the indictment may be removed into the court of king's bench from any inferior jurisdiction, by writ of *certiorari facias*; and cognizance must be claimed in places of exclusive jurisdiction.

cxlvii. **SECT. XXV. Of arraignment, and its incidents.**

(1.) ARRAIGNMENT is the calling of the prisoner to the bar of the court, to answer the matter of the indictment.

(2.) Incident hereunto are, 1. The standing mute of the prisoner; for which, in petit treason, and felonies of death, he shall undergo the *peine fort & dure*. 2. His confession; which is either *simple*, or by way of *approvement*.

cxlviii. **SECT. XXVI. Of plea, and issue.**

(1.) THE *plea*, or defensive matter alleged by the prisoner, may be, 1. A plea to the jurisdiction. 2. A demurrer in point of law. 3. A plea in abatement. 4. A special plea in bar; which is, 1st, *Auterfoits acquit*; 2dly, *Auterfoits convict*; 3dly, *Auterfoits attaint*; 4thly, a pardon. 5. The general issue, not guilty.

2. Hereupon *issue* is joined by the clerk of the arraigns, on behalf of the king.

cxlix. **SECT. XXVII. Of trial, and conviction.**

(1.) TRIALS of offences, by the laws of England were and are, 1. By *ordeal*, of either fire or water. 2. By the *corfned*. Both these have been long abolished. 3. By *battel*, in appeals and approvements. 4. By the *peers* of Great Britain. 5. By *jury*.

(2.) The method and process of trial by *jury* is, 1. The impaneling of the jury. 2. Challenges; 1st, for cause; 2dly, peremptory. 3. *Tales de circumstantibus*. 4. The oath of the jury. 5. The evidence. 6. The verdict, either general or special.

(3.) *Conviction* is when the prisoner pleads, or is found, guilty: whereupon, in felonies, the prosecutor is intitled to, 1. His expenses. 2. Restitution of his goods.

cl. **SECT. XXVIII. Of the benefit of clergy.**

(1.) CLERGY, or the benefit thereof, was originally derived from the usurped jurisdiction of the Popish

ecclesiastics; but hath since been new-modelled by several statutes.

(2.) It is an exemption of the clergy from any other secular punishment for felony, than imprisonment for a year, at the court's discretion; and it is extended likewise, absolutely, to lay peers, for the first offence; and to all lay-commoners, for the first offence also, upon condition of branding, imprisonment, or transportation.

(3.) All felonies are intitled to the benefit of clergy, except such as are now ousted by particular statutes.

(4.) Felons, on receiving the benefit of clergy, (tho' they forfeit their goods to the crown,) are discharged of all clergyable felonies before committed, and restored in all capacities and credits.

**SECT. XXIX. Of judgment, and its consequences.**

cli.

(1.) JUDGMENT (unless any matter be offered in arrest thereof) follows upon conviction; being the pronouncing of that punishment which is expressly ordained by law.

(2.) *Attainder* of a criminal is the immediate consequence, 1. Of having judgment of death pronounced upon him. 2. Of outlawry for a capital offence.

(3.) The consequences of attainder are, 1. *Forfeiture* to the king. 2. *Corruption of blood*.

(4.) *Forfeiture* to the king, is, 1. Of real estates, upon attainder—in high treason, absolutely, till the death of the late Pretender's sons;—in felonies, for the king's year, day, and waste;—in misprison of treason, assaults on a judge, or battery sitting the courts; during the life of the offender. 2. Of personal estates, upon conviction; in all treason, misprison of treason, felony, excusable homicide, petit larciny, standing mute upon arraignment, the abovenamed contempts of the king's courts, and flight.

(5.) *Corruption of blood* is an utter extinction of all inheritable quality therein: so that, after the king's forfeiture is first satisfied, the criminal's lands escheat to the lord of the fee; and he can never afterwards inherit, be inherited, or have any inheritance derived through him.

**SECT. XXX. Of reversal of judgment.**

clii.

(1.) JUDGMENTS, and their consequences, may be avoided, 1. By *falsifying*, or *reversing*, the attainder. 2. By *reprieve*, or *pardon*.

(2.) Attainders may be *falsified*, or *reversed*, 1. Without a writ of error; for matter *dehors* the record. 2. By writ of error; for mistakes in the judgment, or record. 3. By act of parliament; for favour.

(3.) When an *outlawry* is reversed, the party is restored to the same plight as if he had appeared upon the *capias*. When a *judgment*, on conviction, is reversed, the party stands as if never accused.

**SECT. XXXI. Of reprieve and pardon.**

cliii.

(1.) A *REPRIEVE* is a temporary suspension of the judgment, 1. *Ex arbitrio judicis*. 2. *Ex necessitate legis*; for pregnancy, insanity, or the trial of identity of person, which must always be tried *instantly*.

(2.) A *pardon* is a permanent avoider of the judgment by the king's majesty, in offences against his crown and dignity; drawn in due form of law, allowed in

Law of  
England,  
analyzed.

Law of  
Scotland.

in open court, and thereby making the offender a new man.

(3.) The king cannot pardon, 1. Imprisonment of the subject beyond the seas. 2. Offences prosecuted by appeal. 3. Common nufances. 4. Offences against popular or penal statutes, after information brought by a subject. Nor is his pardon pleadable to an impeachment by the commons in parliament.

## PART III. THE LAW OF SCOTLAND.

### SECT. XXXII. Of execution.

Law of  
Scotland.  
cliv.

(1.) Execution is the completion of human punishment, and must be strictly performed in the manner which the law directs.

(2.) The warrant for execution is sometimes under the hand and seal of the judge; sometimes by writ from the king; sometimes by rule of court; but commonly by the judge's signing the calendar of prisoners, with their separate judgments in the margin.

cliv.

Municipal  
law.

### GENERAL OBSERVATIONS.

1. THE municipal law of Scotland, as of most other countries, consists partly of statutory or written law, which has the express authority of the legislative power; partly of customary or unwritten law, which derives force from its presumed or tacit consent.

Statutory  
law.  
Acts of par-  
liament.

2. Under our statutory or written law is comprehended, (1.) Our acts of parliament: not only those which were made in the reign of James I. of Scotland, and from thence down to our union with England in 1707, but such of the British statutes enacted since the union as concerned this part of the united kingdom.

Regiam  
Majestatem

3. The remains of our ancient written law were published by Sir John Skene clerk-register, in the beginning of the last century, by licence of parliament. The books of *Regiam Majestatem*, to which the whole collection owes its title, seem to be a system of Scots law, written by a private lawyer at the command of David I.; and though no express confirmation of that treatise by the legislature appears, yet it is admitted to have been the ancient law of our kingdom by express statutes. The borough-laws, which were also enacted by the same king David, and the statutes of William, Alexander II. David II. and the three Roberts, are universally allowed to be genuine. Our parliaments have once and again appointed commissions to revise and amend the *Regiam Majestatem*, and the other ancient books of our law, and to make their report: but, as no report appears to have been made, nor consequently any ratification by parliament, none of these remains are received, as of proper authority, in our courts; yet they are of excellent use in proving and illustrating our most ancient customs.

Acts of fe-  
derunt.

4. Our written law comprehends, (2.) The acts of federunt, which are ordinances for regulating the forms of proceeding before the court of session in the administration of justice, made by the judges, who have a delegated power from the legislature for that purpose. Some of these acts dip upon matter of right, which declare what the judges apprehend to be the law of Scotland, and what they are to observe afterwards as a rule of judgment.

Authority  
of the civil  
and canon  
laws.

5. The civil or Roman and cannon laws, though they are not perhaps to be deemed proper parts of our written law, have undoubtedly had the greatest influence in Scotland. The powers exercised by our sovereigns and judges have been justified upon no other ground, than that they were conformable to the civil

or canon laws; and a special statute was judged necessary, upon the reformation, to rescind such of their constitutions as were repugnant to the Protestant doctrine. From that period, the canon law has been little respected, except in questions of tithes, patronages, and some few more articles of ecclesiastical right; but the Roman continues to have great authority in all cases where it is not derogated from by statute or custom, and where the genius of our law suffers us to apply it.

6. Our unwritten or customary law, is that which, without being expressly enacted by statute, derives its force from the tacit consent of king and people; which consent is presumed from the ancient custom of the community. Custom, as it is equally founded in the will of the lawgiver with written law, has therefore the same effects: hence, as one statute may be explained or repealed by another, so a statute may be explained by the uniform practice of the community, and even go into disuse by a posterior contrary custom. But this power of custom to derogate from prior statutes, is generally confined by lawyers to statutes concerning private right, and does not extend to those which regard public policy.

Customary  
or common  
law.

7. An uniform tract of the judgments or decisions of the court of session, is commonly considered as part of our customary law; and without doubt, where a particular custom is thereby fixed or proved, such custom of itself constitutes law: but decisions, though they bind the parties litigating, have not, in their own nature, the authority of law in similar cases; yet, where they continue uniform, great weight is justly laid on them. Neither can the judgments of the house of peers of Great Britain reach farther than to the parties in the appeal, since in these the peers act as judges, not as lawyers.

Decisions  
of the session.

8. Though the laws of nature are sufficiently published by the internal suggestion of natural light, civil laws cannot be considered as a rule for the conduct of life, till they are notified to those whose conduct they are to regulate. The *Scots* acts of parliament were, by our most ancient custom, proclaimed in all the different shires, boroughs, and baron-courts, of the kingdom. But after our statutes came to be printed, that custom was gradually neglected; and at last, the publication of our laws, at the market-cross of Edinburgh, was declared sufficient; and they became obligatory forty days thereafter. British statutes are deemed sufficiently notified, without formal promulgation; either because the printing is truly a publication; or because every subject is, by a maxim of the English law, party to

Judgments  
of the house  
of peers.Promulga-  
tion of laws.

Law of Scotland.

to them, as being present in parliament, either by himself or his representative. After a law is published, no pretence of ignorance can excuse the breach of it.

9. As laws are given for the rule of our conduct, they can regulate future cases only; for past actions, being out of our power, can admit of no rule. Declaratory laws form no exception to this; for a statute, where it is declaratory of a former law, does no more than interpret its meaning; and it is included in the notion of interpretation, that it must draw back to the date of the law interpreted.

Interpretation of laws.

10. By the rules of interpreting statute law received in Scotland, an argument may be used from the title to the act itself, *a rubro ad nigrum*; at least, where the rubric has been either originally framed, or afterwards adopted by the legislature. The preamble or narrative, which recites the inconveniences that had arisen from the former law; and the causes inducing the enactment, may also lead a judge to the general meaning of the statute. But the chief weight is to be laid on the statutory words.

11. Laws, being directed to the unlearned as well as the learned, ought to be construed in their most obvious meaning, and not explained away by subtle distinctions; and no law is to suffer a figurative interpretation, where the proper sense of the words is as commodious, and equally fitted to the subject of the statute. Laws ought to be explained so as to exclude absurdities, and in the sense which appears most agreeable to former laws, to the intention of the lawgiver, and to the general frame and structure of the constitution. In prohibitory laws, where the right of acting is taken from a person, solely for the private advantage of another, the consent of him, in whose behalf the law was made, shall support the act done in breach of it; but the consent of parties immediately interested has no effect in matters which regard the public utility of a state. Where the words of a statute are capable but of one meaning, the statute must be observed, however hard it may bear on particular persons. Nevertheless, as no human system of laws can comprehend all possible cases, more may be sometimes meant by the lawgiver than is expressed; and hence certain statutes, where extension is not plainly excluded, may be extended beyond the letter, to similar and omitted cases: others are to be confined to the statutory words.

Strict.

12. A strict interpretation is to be applied, (1.) To corrective statutes, which repeal or restrict former laws; and to statutes which enact heavy penalties, or restrain the natural liberties of mankind. (2.) Laws, made on occasion of present exigencies in a state, ought not to be drawn to similar cases, after the pressure is over. (3.) Where statutes establish certain solemnities as requisite to deeds, such solemnities are not suppleable by equivalents; for solemnities lose their nature, when they are not performed specifically. (4.) A statute, which enumerates special cases, is, with difficulty, to be extended to cases not expressed; but, where a law does not descend to particulars, there is greater reason to extend it to similar cases. (5.) Statutes, which carry a dispensation or privilege to particular persons or societies, suffer a strict interpretation; because they derogate from the general law, and imply a burden upon the rest of the community. Ent at no rate can a privilege be explained to the prejudice of those in whose

behalf it was granted. As the only foundation of customary law is usage, which consists in fact, such law can go no farther than the particular usage has gone.

13. All statutes, concerning matters specially favoured by law, receive an ample interpretation; as laws for the encouragement of commerce, or of any useful public undertaking, for making effectual the wills of dying persons, for restraining fraud, for the security of creditors, &c. A statute, tho' its subject-matter should not be a favourite of the law, may be extended to similar cases, which did not exist when the statute was made; and for which, therefore, it was not in the lawgiver's power to provide.

14. Every statute, however unfavourable, must receive the interpretation necessary to give it effect; and, on the other hand, in the extension of favourable laws, scope must not be given to the imagination, in discovering remote resemblances; the extension must be limited to the cases immediately similar. Where there is ground to conclude that the legislature has omitted a case out of the statute purposely, the statute cannot be extended to that case, let it be ever so similar to the cases expressed.

15. The objects of the laws of Scotland, according to Mr Erskine, are, Persons, Things, and Actions.

## C H A P. I.

## O F P E R S O N S.

**A**MONG persons, judges, who are invested with jurisdiction, deserve the first consideration.

S E C T. I. *Of jurisdiction and judges in general.*

clvi.

Jurisdiction

**JURISDICTION** is a power conferred upon a judge or magistrate, to take cognizance of and decide causes according to law, and to carry his sentences into execution. That tract of ground, or district, within which a judge has the right of jurisdiction, is called his *territory*; and every act of jurisdiction exercised by a judge without his territory, either by pronouncing sentence, or carrying it into execution, is null.

2. The supreme power, which has the right of enacting laws, falls naturally to have the right of erecting courts, and appointing judges, who may apply these laws to particular cases; but, in Scotland, this right has been always intrusted with the crown, as having the executive power of the state.

King the fountain of jurisdiction.

3. Jurisdiction is either supreme, inferior, or mixed. That jurisdiction is supreme, from which there lies no appeal to a higher court. Inferior courts are those whose sentences are subject to the review of the supreme courts, and whose jurisdiction is confined to a particular territory. Mixed jurisdiction participates of the nature both of the supreme and inferior: thus, the judge of the high court of admiralty, and the commissaries of Edinburgh, have an universal jurisdiction over Scotland, and they can review the decrees of inferior admirals and commissaries; but since their own decrees are subject to the review of the courts of session or judiciary, they are, in that respect, inferior courts.

Distinctions of jurisdiction.

4. Jurisdiction is either civil or criminal: by the first, questions of private right are decided; by the other, crimes are punished. But, in all jurisdiction, though merely civil, there is a power inherent in the judge to

[ f ]

punish,

Law of  
Scotland.

punish, either corporally, or by a pecuniary fine, those who offend during the proceedings of the court, or who shall afterwards obstruct the execution of the sentence.

5. Jurisdiction is either private or cumulative. Private jurisdiction, is that which belongs only to one court, to the exclusion of all others. Cumulative, otherwise called *concurrent*, is that which may be exercised by any one of two or more courts, in the same cause. In civil cumulative jurisdiction, the private pursuer has the right of election before which of the courts he shall sue; but as, in criminal questions which are prosecuted by a public officer of court, a collision of jurisdiction might happen, through each of the judges claiming the exercise of their right, that judge, by whose warrant the delinquent is first cited or apprehended, (which is the first step of jurisdiction), acquires thereby (*jure preventivis*) the exclusive right of judging in the cause.

6. All rights of jurisdiction, being originally granted in consideration of the fitness of the grantee, were therefore personal, and died with himself. But, upon the introduction of the feudal system, certain jurisdictions were annexed to lands, and descended to heirs, as well as the lands to which they were annexed; but now all heritable jurisdictions, except those of admiralty and a small pittance reserved to barons, are either abolished, or resumed and annexed to the crown.

7. Jurisdiction is either proper or delegated. Proper jurisdiction, is that which belongs to a judge or magistrate himself, in virtue of his office. Delegated, is that which is communicated by the judge to another who acts in his name, called a *depute* or *deputy*. Where a deputy appoints one under him, he is called a *substitute*. No grant of jurisdiction, which is an office requiring personal qualifications, can be delegated by the grantee to another, without an express power in the grant.

Civil Juris-  
diction,  
wherein  
founded.

8. Civil jurisdiction is founded, 1. *Ratione domicilii*, if the defender has his domicile within the judge's territory. A domicile is the dwelling-place where a person lives with an intention to remain; and custom has fixed it as a rule, that residence for 40 days founds jurisdiction. If one has no fixed dwelling-place, e.g. a soldier, or a travelling-merchant, a personal citation against him within the territory is sufficient to found the judge's jurisdiction over him, even in civil questions. As the defender is not obliged to appear before a court to which he is not subject, the pursuer must follow the defender's domicile.

9. It is founded, 2. *Ratione rei sitæ*, if the subject in question lie within the territory. If that subject be immovable, the judge, whose jurisdiction is founded in this way, is the sole judge competent, excluding the judge of the domicile.

Letters of  
supplement

10. Where one, who has not his domicile within the territory, is to be sued before an inferior court *ratione rei sitæ*, the court of session must be applied to, whose jurisdiction is universal, and who, of course, grants letters of supplement to cite the defender to appear before the inferior judge. Where the party to be sued resides in another kingdom, and has an estate in this, the court of session is the only proper court, as the *commune forum* to all persons residing abroad; and the defender, if his estate be heritable, is considered as law-

Law of  
Scotland.

fully summoned to that court, by a citation at the market-cross of Edinburgh, and pier and shore of Leith; but where a stranger, not a native of Scotland, has only a moveable estate in this kingdom, he is deemed to be so little subject to the jurisdiction of our courts, that action cannot be brought against him till his effects be first attached by an arrestment *jurisdictionis fundandæ causæ*; which is laid on by a warrant issuing from the supreme courts of session, or admiralty, or from that within whose territory the subject is situated, at the suit of the creditor.

Arrestment  
of strangers.

11. A judge may, in special cases, arrest or secure the persons of such as have neither domicile nor estate within his territory, even for civil debts. Thus, on the border between Scotland and England, warrants are granted of course by the judge-ordinary of either side, against those who have their domicile upon the opposite side, for arresting their persons, till they give caution *judicio filii*; and even the persons of citizens or natives may be so secured, where there is just reason to suspect that they are in *meditatione fugæ*, i. e. that they intend suddenly to withdraw from the kingdom; upon which suspicion, the creditor who applies for the warrant must make oath. An inhabitant of a borough-royal, who has furnished one who lives without the borough in meat, clothes, or other merchandise, and who has no security for it but his own account-book, may arrest his debtor, till he give security *judicio filii*.

12. A judge may be declined, i. e. his jurisdiction disowned judicially, 1. *Ratione causæ*, from his incompetency to the special cause brought before him. 2. *Ratione suspecti judicis*; where either the judge himself, or his near kinsman, has an interest in the suit. No judge can vote in the cause of his father, brother, or son, either by consanguinity or affinity; nor in the cause of his uncle or nephew by consanguinity. 3. *Ratione privilegii*; where the party is by privilege exempted from their jurisdiction.

Grounds of  
declinature

13. Prorogated jurisdiction (*jurisdiction in consentienter*) is that which is, by the consent of parties, conferred upon a judge, who, without such consent, would be incompetent. Where a judge is incompetent, every step he takes must be null, till his jurisdiction be made competent by the parties actual submission to it. It is otherwise where the judge is competent, but may be declined by the party upon privilege.

Prorogated  
jurisdiction

14. In order to prorogation, the judge must have jurisdiction, such as may be prorogated. Hence, prorogation cannot be admitted where the judge's jurisdiction is excluded by statute. Yet where the cause is of the same nature with those to which the judge is competent, though law may have confined his jurisdiction within a certain sum, parties may prorogate it above that sum unless where prorogation is prohibited. Prorogation is not admitted in the king's causes; for the interest of the crown cannot be hurt by the negligence of its officers.

15. All judges must at their admission swear, 1. The Oaths of oath of allegiance, and subscribe the assurance; 2. The judges, oath of abjuration; 3. The oath of supremacy; lastly, The oath de *fidei administratione*.

16. A party who has either properly declined the jurisdiction of the judge before whom he had been cited, or who thinks himself aggrieved by any proceedings in the cause, may, before decree, apply to the court

Letters of  
advocation

Law of Scotland.

of session to issue letters of advocacy for calling the action from before the inferior court to themselves. The grounds therefore, upon which a party may pray for letters of advocacy, are incompetency and iniquity. Under incompetency, is comprehended not only defect of jurisdiction, but all the grounds of declining a jurisdiction, in itself competent, arising either from suspicion of the judge, or privilege in the parties. A judge is said to commit iniquity, when he either delays justice, or pronounces sentence, in the exercise of his jurisdiction, contrary to law.

Advocation  
show limit-  
ed.

17. That the court of session may not waste their time in trifles, no cause for a sum below twelve pound Sterling can be advocated to the court of session from the inferior judge competent; but if an inferior judge shall proceed upon a cause to which he is incompetent, the cause may be carried from him by advocacy, let the subject be ever so inconsiderable.

civii.

## SECT. II. *Of the supreme judges and courts of Scotland.*

King,

and

parliament.

1. THE king, who is the fountain of jurisdiction, might by our constitution have judged in all causes, either in his own person, or by those whom he was pleased to vest with jurisdiction.

parliament  
Great  
Britain.

2. The parliament of Scotland, as our court of the last resort, had the right of reviewing the sentences of all our supreme courts.

court of  
session.

3. By the treaty of union, 1707, the parliaments of Scotland and England are united into one parliament of Great Britain. From this period, the British house of peers, as coming in place of the Scots parliament, is become our court of the last resort, to which appeals lie from all the supreme courts of Scotland; but that court has no original jurisdiction in civil matters, in which they judge only upon appeal. By art. 22. of that treaty, the Scots share of the representation in the house of peers is fixed to 16 Scots peers elective; and in the house of commons, to 45 commoners, of which 30 are elected by the freeholders of counties, and 15 by the royal boroughs. The Scots privy council was also thereupon abolished, and sunk into that of Great Britain, which for the future is declared to have no other powers than the English privy council had at the time of the union.

4. A court was erected in 1425, consisting of certain persons to be named by the king, out of the three estates of parliament, which was vested with the jurisdiction formerly lodged in the council, and got the name of the *session*, because it was ordained to hold annually a certain number of sessions at the places to be specially appointed by the king. This court had a jurisdiction, cumulative with the judge ordinary, in spoliations, and other possessory actions, and in debts; but they had no cognisance in questions of property of heritable subjects. No appeal lay from its judgments to the parliament. The judges of this court served by rotation, and were changed from time to time, after having sat 40 days; and became so negligent in the administration of justice, that it was at last thought necessary to transfer the jurisdiction of this court to a council to be named by the king, called the *daily council*.

College of  
justice.

5. The present model of the court of session, or college of justice, was formed in the reign of James V.

Law of  
Scotland.

The judges thereof, who are vested with an universal civil jurisdiction, consisted originally of seven churchmen, seven laymen, and a president, whom it behoved to be a prelate; but spiritual judges were in 1584 partly, and in 1640 totally, prohibited. The judges of session have been always received by warrants from the crown. Anciently his majesty seems to have transferred to the court itself the right of choosing their own president; and in a federut recorded June 26. 1593, the king condescended to present to the lords, upon every vacancy in the bench, a list of three persons, out of which they were to chuse one. But his majesty soon resumed the exercise of both rights, which continued with the crown till the usurpation; when it was ordained, that the king should name the judges of the session, by the advice of parliament. After the restoration, the nomination was again declared to be solely in the sovereign.

Judges, by  
whom nam-  
ed.

6. Though judges may, in the general case, be named at the age of 21 years, the lords of session must be at least 25. No person can be named lord of session, who has not served as an advocate or principal clerk of session for five years, or as a writer to the signet for ten; and in the case of a writer to the signet, he must undergo the ordinary trials upon the Roman law, and be found qualified two years before he can be named. Upon a vacancy in the bench, the king presents the successor by a letter addressed to the lords, wherein he requires them to try and admit the person presented. The powers given to them to reject the pretence upon trial are taken away, and a bare liberty to remonstrate substituted in its place.

Their qua-  
lifications  
and trial.

7. Besides the 15 ordinary judges, the king was allowed to name three or four lords of his great council, who might sit and vote with them. These extraordinary lords were suppressed in the reign of Geo. I.

8. The appellation of the *college of justice* is not confined to the judges, who are distinguished by the name of *senators*; but comprehends advocates, clerks of session, writers to the signet, and others, as described, *Act S.* 23d Feb. 1687. Where, therefore, the college of justice is intitled to any privilege, it extends to all the members of the college. They are exempted from watching, warding, and other services within borough; and from the payment of minister's stipends, and of all customs, &c. imposed upon goods carried to or from the city of Edinburgh.

Privileges  
of the col-  
lege of ju-  
stice.

9. Though the jurisdiction of the session be properly limited to civil causes, the judges have always sustained themselves as competent to the crime of falsehood. Where the falsehood deserves death or demerabration, they, after finding the crime proved, remit the criminal to the court of judicatory. Special statute has given to the court of session jurisdiction in contraventions of law-burrows, forfeitures, and breach of arrestment; and they have been in use to judge in battery *pendente lite*, and in usury.

Jurisdiction  
of the ses-  
sion.

9. In certain civil causes, the jurisdiction of the session is exclusive of all inferior jurisdictions; as in declarators of property, and other competitions of heritable rights, provings of the tenor, *cessiones bonorum*, restitution of minors, reductions of decrees or of writings, sales of the estates of minors or bankrupts, &c. In a second class of causes, their jurisdiction can be only exercised in the way of review, after the cause is brought

from the inferior court; as in maritime and consistorial causes, which must be pursued in the first instance before the admiral or commissary; and in actions below twelve pounds Sterling, which must be commenced before the judge-ordinary. In all civil actions, which fall under neither of these classes, the jurisdiction of the session is concurrent, even in the first instance, with that of the judge-ordinary. The session may proceed as a court of equity by the rules of conscience, in abating the rigour of law, and giving aid in proper cases to such as in a court of law can have no remedy: and this power is inherent in the supreme court of every country, where separate courts are not established for law and for equity.

Judiciary  
court.

10. The supreme criminal judge was styled the Judiciary; and he had anciently an universal civil jurisdiction, even in matters of heritage. He was obliged to hold two justice courts or ayres yearly at Edinburgh or Peebles, where all the free-holders of the kingdom were obliged to attend. Besides this universal court, special justice-ayres were held in all the different shires of the kingdom twice in the year. These last having gone into disuse, eight deputies were appointed, two for every quarter of the kingdom, who should make their circuits over the whole in April and October.

11. The office of deputies was suppressed in 1672; and five lords of session were added, as commissioners of Judiciary, to the justice-general and justice-clerk. The justice-general, if present, is constant president of the court, and in his absence the justice-clerk. The kingdom is divided into three districts, and two of the judges are appointed to hold circuits in certain boroughs of each district twice in the year; one judge may proceed to business in the absence of his colleague.

12. By an old statute, the crimes of robbery, rape, murder, and wilful fire-raising, (the four pleas of the Crown), are said to be referred to the King's court of Judiciary; but the only crime in which, *de pravi*, the jurisdiction of Judiciary became at last exclusive of all inferior criminal jurisdiction, was that of high treason. The court of Judiciary, when sitting at Edinburgh, has a power of advocating causes from all inferior criminal judges, and of suspending their sentences.

13. The circuit-court can also judge in all criminal causes which do not infer death or demeritation, upon appeal from any inferior court within their district; and has a supreme civil jurisdiction, by way of appeal, in all causes not exceeding twelve pounds Sterling, in which their decrees are not subject to review; but no appeal is to lie to the circuit, till the cause be finally determined in the inferior court.

Court of  
exchequer.

14. The court of Exchequer, as the King's chamberlain court, judged in all questions of the revenue. In pursuance of the treaty of Union, that court was abolished, and a new court erected, consisting of the Lord High Treasurer of Great Britain, and a chief Baron, with four other Barons of Exchequer; which Barons are to be made of sergeants at law, English barristers, or Scots advocates of five years standing. This court has a privative jurisdiction conferred upon it, as to the duties of customs, excise, or other revenues appertaining to the king or prince of Scotland, and as to all honours and estates that may accrue to the crown; in which matters, they are to judge by the forms of pro-

ceeding used in the English court of exchequer, under the following limitations; that no debt due to the crown shall affect the debtor's real estate in any other manner than such estate may be affected by the laws of Scotland, and that the validity of the crown's titles to any honours or lands shall continue to be tried by the court of session. The barons have the powers of the Scots court transferred to them, of passing the accounts of sheriffs, or other officers who have the execution of writs issuing from or returnable to the court of exchequer, and of receiving resignations, and passing figures of charters, gifts of casualties, &c. But tho' all these must pass in exchequer, it is the court of session only who can judge of their preference after they are completed.

15. The jurisdiction of the admiral in maritime causes was of old concurrent with that of the session. The high-admiral is declared the king's justice-general upon the seas, on fresh water within flood-mark, and in all harbours and creeks. His civil jurisdiction extends to all maritime causes; and so comprehends questions of charter-parties, freights, salvages, bottomries, &c. He exercises this supreme jurisdiction by a delegate, the judge of the high court of admiralty; and he may also name inferior deputies, whose jurisdiction is limited to particular districts, and whose sentences are subject to the review of the high court. In causes which are declared to fall under the admiral's cognizance, his jurisdiction is sole; in so much that the session itself, though it may review his decrees by suspension or reduction, cannot carry a maritime question from him by advocacy. The admiral has acquired, by usage, a jurisdiction in mercantile causes, even where they are not strictly maritime, cumulative with that of the judge-ordinary.

Admiralty  
court.

16. All our supreme courts have seals or signets, proper to their several jurisdictions. The courts of session and judiciary used formerly the same signet, which was called the king's, because the writs issuing from thence run in the king's name; and though the judiciary got at last a separate signet for itself, yet that of the session still retains the appellation of the king's signet. In this office are sealed summonses for citation, letters of executorial diligence, or for staying or prohibiting of diligence, and generally whatever passes by the warrant of the session, and is to be executed by the officers of the court. All these must, before sealing, be signed by the writers or clerks of the signet: But letters of diligence, where they are granted in a depending process, merely for probation, though they pass by the signet, must be subscribed by a clerk of session. The clerks of the signet also prepare and subscribe all signatures of charters, or other royal grants, which pass in exchequer.

Signet.

### SECT. III. Of the inferior judges and courts of Scotland.

civili.

SHERIFF, from *reeve*, governor, and *sheer*, to cut or divide, is the judge-ordinary constituted by the crown over a particular division or county. The sheriff's jurisdiction, both civil and criminal, was, in ancient times, nearly as ample within his own territory as that of the supreme courts of session and judiciary was over the whole kingdom.

Sheriff.

2. His civil jurisdiction now extends to all actions upon contracts, or other personal obligations; forth-

comings,

comings, poundings of the ground, mails and duties; and to all possessory actions, as removings, ejections, spuilzies, &c.; to all grievances issuing from the chancery, as of inquest, terre, division, tutory, &c.; and even to adjudications of land-estates, when proceeding on the renunciation of the apparent heir. His present criminal jurisdiction extends to certain capital crimes, as theft, and even murder, though it be one of the pleas of the crown; and he is competent to most questions of public police, and has a cumulative jurisdiction with justices of the peace in all riots and breaches of the peace.

3. Sheriffs have a ministerial power, in virtue of which they return juries, in order to the trial of causes that require juries. The writs for electing members of parliament have been, since the union, directed to the sheriffs, who, after they are executed, return them to the crown-office from whence they issued. They also execute writs issuing from the court of exchequer; and in general, take care of all estates, duties, or casualties that fall to the crown within their territory, for which they must account to the exchequer.

4. A lord of regality was a magistrate who had a grant of lands from the sovereign, with royal jurisdiction annexed thereto. His civil jurisdiction was equal to that of a sheriff; his criminal extended to the four pleas of the crown. He had a right to repledge or reclaim all criminals, subject to his jurisdiction, from any other competent court, though it were the judiciary itself, to his own. He had also right, according to the most common opinion, to the single escape of all denounced persons residing within his jurisdiction, even though such privilege had not been expressed in the grant of regality.

5. The steward was the magistrate appointed by the king over such regality lands as happened to fall to the crown by forfeiture, &c. and therefore the steward's jurisdiction was equal to that of a regality. The two stewartries of Kircudbright, and of Orkney and Zetland, make shires or counties by themselves, and send each a representative to parliament.

6. Where lands not erected into a regality fell into the king's hands, he appointed a baillie over them, whose jurisdiction was equal to that of a sheriff.

7. By the late jurisdiction-act, 20 Geo. II. all heritable regalities and bailleries, and all such heritable sheriffships and stewartries as were only parts of a shire, are dissolved; and the powers formerly vested in them are made to devolve upon such of the king's courts as these powers would have belonged to if the jurisdictions dissolved had never been granted. All sheriffships and stewartries that were no part of a shire, where they had been granted, either heritably or for life, are resumed and annexed to the crown. No high sheriff or steward can hereafter judge personally in any cause. One sheriff or steward-depute is to be appointed by the king in every shire, who must be an advocate of three years standing; and after a certain term not yet expired, all commissions to these deputies are to be granted for life.

8. The appanage, or patrimony, of the prince of Scotland, has been long erected into a regality-jurisdiction, called the Principality. It is personal to the king's eldest son, upon whose death or succession it returns to the crown. The prince has, or may have, his

own chancery, from which his writs issue, and may name his own chamberlain and other officers for receiving and managing his revenue. The vassals of the prince are intitled to elect, or to be elected, members of parliament for counties, equally with those who hold of the crown.

9. Justices of the peace are magistrates named by the sovereign over the several counties of the kingdom, for the special purpose of preserving the public peace. Anciently their power reached little farther than to bind over disorderly persons for their appearance before the privy council or judiciary; afterwards they were authorized to judge in breaches of the peace, and in most of the laws concerning public policy. They may compel workmen or labourers to serve for a reasonable fee, and they can condemn masters in the wages due to their servants. They have power to judge in questions of highways, and to call out the tenants with their cottars and servants to perform six days work yearly for upholding them.

10. Since the Union, our justices of the peace, over and above the powers committed to them by the laws of Scotland, are authorized to exercise whatever belonged to the office of an English justice of the peace, in relation to the public peace. From that time, the Scots and the English commissions have run in the same style, which contain powers to inquire into and judge in all capital crimes, witchcrafts, felonies, and several others specially enumerated; with this limitation subjoined, *of which justices of the peace may lawfully inquire*. Two justices can constitute a court. Special statute has given the cognizance of several matters of excise to the justices, in which their sentences are final.

11. A borough is a body-corporate, made up of Boroughs the inhabitants of a certain tract of ground erected by the sovereign, with jurisdiction annexed to it. Boroughs are erected, either to be holden of the sovereign himself, which is the general case of royal boroughs; or of the superior of the lands erected, as boroughs of regality and barony. Boroughs royal have power, by their charters, to chuse annually certain office-bearers or magistrates; and in boroughs of regality and barony, the nomination of magistrates is, by their charter, lodged sometimes in the inhabitants, sometimes in the superior. Baillies of boroughs have jurisdiction in matters of debt, services, and questions of possession betwixt the inhabitants. Their criminal jurisdiction extends to petty riots, and reckless fire-raising. The dean of guild is that magistrate of a royal-borough who is head of the merchant-company: he has the cognizance of mercantile causes within borough; and the inspection of buildings, that they encroach neither on private property, nor on the public streets; and he may direct insufficient houses to be pulled down. His jurisdiction has no dependence on the court of the borough, or baillie-court.

12. A baron, in the large sense of that word, is one who holds his lauds immediately of the crown; and, as such, had, by our ancient constitution, right to a seat in parliament, however small his freehold might have been. The lesser barons were exempted from the burden of attending the service of parliament. This exemption grew insensibly into an utter disability in all the lesser barons from sitting in parliament, without election.

Law of  
Scotland.

lection by the county; though no statute is to be found expressly excluding them.

13. To constitute a baron in the strict law-sense, his lands must have been erected, or at least confirmed, by the king, *in liberam baroniam*; and such baron had a certain jurisdiction, both civil and criminal, which he might have exercised, either in his own person, or by his bailie.

14. By the late jurisdiction-act, the civil jurisdiction of a baron is reduced to the power of recovering, from his vassals and tenants, the rents of his lands, and of condemning them in mill-services; and of judging in causes where the debt and damages do not exceed 40s. Sterling. His criminal jurisdiction is, by the same statute, limited to assaults, batteries, and other smaller offences, which may be punished by a fine not exceeding 20s. Sterling, or by letting the offender in the stocks in the day-time not above three hours; the fine to be levied by poinding, or one month's imprisonment. The jurisdiction formerly competent to proprietors of mines, and coal or salt-works, over their workmen, is reserved; and also that which was competent to proprietors who had the right of fairs or markets, for correcting the disorders that might happen during their continuance; provided they shall exercise no jurisdiction inferring the loss of life or demeritation.

Constabularies.

15. The high constable of Scotland had no fixed territorial jurisdiction, but followed the court; and had, jointly with the marischal, the cognizance of all crimes committed within two leagues of it. All other constabularies were dependent on him: these had castles, and sometimes boroughs, subject to their jurisdiction, as Dundee, Montrose, &c. and among other powers, now little known, they had the right of exercising criminal jurisdiction within their respective territories during the continuance of fairs. By the late jurisdiction-act, all jurisdictions of constabulary are dissolved, except that of high-constable.

Lyon king  
at arms.

16. The office of the Lyon King of arms was chiefly ministerial, to denounce war, proclaim peace, carry public messages, &c. But he has also a right of jurisdiction, whereby he can punish all who usurp arms contrary to the law of arms, and deprive or suspend messengers, heralds, or pursuivants, (who are officers named by himself); but he has no cognizance of the damage arising to the private party through the messenger's fault. Messengers are subservient to the supreme courts of session and judiciary; and their proper business is to execute all the king's letters either in civil or criminal causes.

Sentence-money.

17. Our judges had, for a long time, no other salaries or appointments than what arose from the sentences they pronounced. Our criminal judges applied to their own use the fines or issues of their several courts; and regalities had a right to the single (cheat of all persons denounced, who resided within their jurisdiction; and our civil judges got a certain proportion of the sum contained in the decree pronounced. But these were all prohibited upon regular salaries being settled upon them.

elix.

#### SECT. V. Of ecclesiastical persons.

The pope.

THE POPE, or bishop of Rome, was long acknowledged, over the western part of Christendom, for the

head of the Christian church. The papal jurisdiction was abolished in Scotland *anno* 1560. The king was, by act 1669, declared to have supreme authority over all persons, and in all causes ecclesiastical; but this act was repealed by 1690, as inconsistent with Presbyterian church-government, which was then upon the point of being established.

Law of  
Scotland.

2. Before the reformation from Popery, the clergy was divided into secular and regular. The secular had a particular tract of ground given them in charge, within which they exercised the pastoral office of bishop, presbyter, or other church-officer. The regular clergy had no cure of souls; but were tied down to residence in their abbacies, priories, or other monasteries: and they got the name of *regular*, from the rules of mortification to which they were bound, according to the institution of their several orders. Upon the vacancy of any benefice, whether secular or regular, commendators were frequently appointed to levy the fruits, as factors or stewards during the vacancy. The Pope alone could give the higher benefices in *commendam*; and at last, from the plenitude of his power, he came to name commendators for life, and without any obligation to account. After the reformation, several abbacies and priories were given by James VI. *in perpetuam commendam*, to laics.

3. Upon abolishing the Pope's authority, the regular clergy were totally suppressed; and, in place of all the different degrees which distinguished the secular clergy, we had at first only parochial presbyters or ministers, and superintendents, who had the oversight of the church within a certain district: soon thereafter the church-government became episcopal by archbishops, bishops, &c.; and after some intermediate turns, is now presbyterian by kirk-sessions, presbyteries, synods, and general assemblies.

4. Prelate, in our statutes, signifies a bishop, abbot, or other dignified clergyman, who in virtue of his office had a seat in parliament. Every bishop had his chapter, which consisted of a certain number of the ministers of the diocese, by whose assistance he managed the affairs of the church within that district. The nomination of bishops to vacant sees has been in the crown since 1540, though under the appearance of continuing the ancient right of election, which was in the chapter. The confirmation by the crown under the great seal, of the chapter's election, conferred a right to the spirituality of the benefice; and a second grant, upon the consecration of the bishop-elect, gave a title to the temporality; but this second grant fell soon into disuse.

5. He who founded or endowed a church was in- Patrons. titled to the right of patronage thereof, or *advocatio ecclesie*; whereby, among other privileges, he might present a churchman to the cure, in case of a vacancy. The presentee, after he was received into the church, had a right to the benefice *proprio jure*; and if the church was parochial, he was called a *parson*. The Pope claimed the right of patronage of every kirk to which no third party could shew a special title; and, since the reformation, the crown, as coming in place of the Pope, is considered as universal patron, where no right of patronage appears in a subject. Where two churches are united, which had different patrons, each patron presents by turns.

6. Gentle-

6. Gentlemen of estates frequently founded colleges or collegiate churches; the head of which got the name of *provost*, under whom were certain prebendaries, or canons, who had their several stalls in the church, where they sung masses. Others of lesser fortunes founded chaplainries, which were donations granted for the singing of masses for deceased friends at particular altars in a church. Though all these were suppressed upon the reformation, their founders continued patrons of the endowments; out of which they were allowed to provide burars, to be educated in any of the universities.

7. Where a fund is gifted for the establishment of a second minister in a parish where the cure is thought too heavy for one, the patronage of such benefice does not belong to the donor, but to him who was patron of the church, unless either where the donor has reserved to himself the right of patronage in the donation, or where he and his successors have been in the constant use of presenting the second minister, without challenge from the patron. The right of presenting incumbents was by 1690, c. 23. taken from patrons, and vested in the heritors and elders of the parish, upon payment to be made by the heritors to the patron of 600 merks; but it was again restored to patrons, 10 An. c. 12. with the exception of the presentations fold in pursuance of the former act.

8. Patrons were not simply administrators of the church; for they held the fruits of the vacant benefice as their own, for some time after the reformation. But that right is now no more than a trust in the patron, who must apply them to pious uses within the parish, at the sight of the heritors, yearly as they fall due. If he fail, he loses his right of administering the vacant stipend for that and the next vacancy. The king, who is exempted from this rule, may apply the vacant stipend of his churches to any pious use, though not within the parish. If one should be ordained to a church, in opposition to the presentee, the patron, whose civil right cannot be affected by any sentence of a church-court, may retain the stipend as vacant. Patrons are to this day intitled to a seat and burial-place in the churches of which they are patrons, and to the right of all the teinds of the parish not heritably disposed.

9. That kirks may not continue too long vacant, the patron must present to the presbytery, (formerly to the bishop), a fit person for supplying the cure, within six months from his knowledge of the vacancy, otherwise the right of presentation accrues to the presbytery *jure devoluto*. Upon presentation by the patron, the bishop collated or conferred the benefice upon the presentee by a writing, in which he appointed certain ministers of the diocese to induce or institute him into the church; which induction completed his right, and was performed by their placing him in the pulpit, and delivering him the bible and keys of the church. The bishop collated to the churches of which himself was patron, *pleno jure*, or without presentation; which he also did in menial churches, whose patronages were sunk, by the churches being appropriated to him, as part of his patrimony. Since the revolution, a judicial act of admission by the presbytery, proceeding either upon a presentation, or upon a call from the heritors and elders, or upon their own *jus devolutum*, completes

the minister's right to the benefice.

10. Soon after the reformation, the Popish churches were prevailed upon to resign in the sovereign's hands, a third of their benefices; which was appropriated, in the first place, for the subsistence of the reformed clergy. To make this fund effectual, particular localities were assigned in every benefice, to the extent of a third, called the *assumption of thirds*; and for the farther support of ministers, Queen Mary made a grant in their favour of all the small benefices not exceeding 300 merks. Bishops, by the act which restored them to the whole of their benefices, were obliged to maintain the ministers within their dioceses, out of the thirds; and in like manner, the laic titulars, who got grants of the teinds, became bound, by their acceptance thereof, to provide the kirks within their erections in competent stipends.

11. But all these expedients for the maintenance of the clergy having proved ineffectual, a commission of parliament was appointed in the reign of James VI. for planting kirks, and modifying stipends to ministers out of the teinds; and afterwards several other commissions were appointed, with the more ample powers of dividing large parishes, erecting new ones, &c. all of which were, in 1707, transferred to the court of session, with this limitation, that no parish should be disjoined, nor new church erected, nor old one removed to a new place, without the consent of three-fourths of the heritors, computing the votes, not by their numbers, but by the valuation of their rents within the parish. The judges of session, when sitting in that court, are considered as a commission of parliament, and have their proper clerks, maces, and other officers of court, as such.

12. The lowest stipend that could be modified to a minister by the first commission, was 500 merks, or five chalders of victual, unless where the whole teinds of the parish did not extend so far; and the highest was 1600 merks, or ten chalders. The parliament 1633 raised the *minimum* to eight chalders of victual, and proportionably in silver; but as neither the commission appointed by that act, nor any of the subsequent ones, was limited as to the *maximum*, the commissioners have been in use to augment stipends considerably above the old *maximum*, where there is sufficiency of free teinds, and the cure is burdensome, or living expensive.

13. Where a certain quantity of stipend is modified to a minister out of the teinds of a parish, without proportioning that stipend among the several heritors, the decree is called a *decree of modification*; but where the commissioners also fix the particular proportions payable by each heritor, it is a *decree of modification and locality*. Where a stipend is only modified, it is secured on the whole teinds of the parish, so that the minister can insist against any one heritor to the full extent of his teinds; such heritor being always entitled to relief against the rest, for what he shall have paid above his just share; but where the stipend is also localised, each heritor is liable in no more than his own proportion.

14. Few of the reformed ministers were, at first, Manse, provided with dwelling-houses; most of the Popish clergy having, upon the first appearance of the reformation, let their manse in feu, or in long tacks: ministers

Law of Scotland.  
Provision for the reformed clergy.

on for planting kirks, valuing teinds, &c.

Stipends.

Law of Scotland.

Law of Scotland.

nisters therefore got a right, in 1563, to as much of these manes as would serve them, notwithstanding such feus or tacks. Where there was no parson's nor vicar's manse, one was to be built by the heritors, at the sight of the bishop, (now the presbytery), the charge not exceeding L. 1000 Scots, nor below 500 merks. Under a manse are comprehended stable, barn, and byre, with a garden; for all which, it is usual to allow half an acre of ground.

15. Every incumbent is intitled at his entry to have his manse put into good condition; for which purpose, the presbytery may appoint a visitation by tradesmen, and order estimates to be laid before them of the sums necessary for the repairing, which they may proportion among the heritors according to their valuations. The presbytery, after the manse is made sufficient, ought, upon application of the heritors, to declare it a free manse; which lays the incumbent under an obligation to uphold it in good condition during his incumbency, otherwise he or his executors shall be liable in damages, but they are not bound to make up the loss arising from the necessary decay of the building by the waste of time.

Glebe, and 16. All ministers, where there is any landward or country-parish, are, over and above their stipend, intitled to a glebe, which comprehends four acres of arable land, or sixteen fowms of pasture-ground where there is no arable land, (a fowm is what will graze ten sheep or one cow); and is to be designed or marked by the bishop or presbytery out of such kirk-lands within the parish as lie nearest to the kirk, and, in default of kirk-lands, out of temporal lands.

17. A right of relief is competent to the heritors, whose lands are set off for the manse or glebe, against the other heritors of the parish. Manes and glebes, being once regularly designed, cannot be feued or sold by the incumbent in prejudice of his successors, which is in practice extended even to the case where such alienation evidently appears profitable to the benefice.

Grafts.

18. Ministers, beside their glebe, are intitled to grafts for a horse and two cows. And, if the lands, out of which the grafts may be designed, either lie at a distance, or are not fit for pasture, the heritors are to pay to the minister L. 20 Scots yearly as an equivalent. Ministers have also freedom of faggage, pasturage, fewel, feal, divot, loaning, and free ish and entry, according to use and wont: what these privileges are, must be determined by the local custom of the several parishes.

Terms of payment of stipends.

19. The legal terms at which stipends become due to ministers are Whitunday and Michaelmas. If the incumbent be admitted to his church before Whitunday, till which term the corns are not presumed to be fully sown, he has right to that whole year's stipend; and, if he is received after Whitunday, and before Michaelmas, he is intitled to the half of that year; because, though the corns were sown before his entry, he was admitted before the term at which they are presumed to be reaped. By the same reason, if he dies or is transported before Whitunday, he has right to no part of that year; if before Michaelmas, to the half; and if not till after Michaelmas, to the whole.

Annat or ann.

20. After the minister's death, his executors have right to the annat; which, in the sense of the canon

law, was a right reserved to the Pope, of the first year's fruits of every benefice. Upon a threatened invasion from England anno 1547, the annat was given by our parliament, notwithstanding this right in the Pope, to the executors of such churchmen as should fall in battle in defence of their country; but the word *annat* or *ann*, as it is now understood, is the right which law gives to the executors of ministers, of half a year's benefice over and above what was due to the minister himself for his incumbency.

21. The executors of a minister need make up no title to the ann by confirmation: neither is the right assignable by the minister, or affectable with his debts; for it never belonged to him, but is a mere gratuity given by law to those whom it is presumed the deceased could not sufficiently provide; and law has given it expressly to *executors*; and if it were to be governed by the rules of succession in executory, the widow, in case of no children, would get one half, the other would go to the next of kin; and where there are children, the widow be entitled to a third, and the other two thirds would fall equally among the children. But the court of session, probably led by the general practice, have in this last case divided the ann into two equal parts, of which one goes to the widow, and the other among the children *in capita*.

Jurisdiction of bishops.

22. From the great confidence that was, in the first ages of Christianity, reposed in churchmen, dying persons frequently committed to them the care of their estates, and of their orphan children; but these were simply rights of trust, not of jurisdiction. The clergy soon had the address to establish to themselves a proper jurisdiction, not confined to points of ecclesiastical right, but extending to questions that had no concern with the church. They judged not only in tithes, patronages, testaments, breach of vow, scandal, &c.; but in questions of marriage and divorce, because marriage was a sacrament; in tithes, because these were given in consideration of marriage; in all questions where an oath intervened, on pretence that oaths were a part of religious worship, &c. As churchmen came, by the means of this extensive jurisdiction, to be diverted from their proper functions, they committed the exercise of it to their officials or commissaries: hence the commissary-court was called the *Bishop's Court*, and *Curia Christianitatis*; it was also styled the *Consistorial Court*; from *consistory*, a name first given to the court of appeals of the Roman emperors, and afterwards to the courts of judicature held by churchmen.

23. At the reformation, all episcopal jurisdiction, Commissary exercised under the authority of the bishop of Rome, &c. was abolished. As the course of justice in consistorial causes was thereby stopped, Q. Mary, besides naming a commissary for every diocese, did, by a special grant, establish a new commissary-court at Edinburgh, consisting of four judges or commissaries. This court is vested with a double jurisdiction; one diocesan, which is exercised in the special territory contained in the grant, *viz.* the counties of Edinburgh, Haddington, Linlithgow, Peebles, and a great part of Stirlingshire; and another universal, by which the judges confirm the testaments of all who die in foreign parts, and may reduce the decrees of all inferior commissaries, provided the reduction be pursued within a year after the decree:

crec : bishops, upon their re-establishment in the reign of James VI. were reitor to the right of naming their several commissaries.

24. As the clergy, in times of Popery, assumed a jurisdiction independent of the civil power or any secular court, their sentences could be reviewed only by the Pope, or judges delegated by him; so that, with regard to the courts of Scotland, their jurisdiction was supreme. But, by an act 1560, the appeals from our bishops courts, that were then depending before the Roman consistories, were ordained to be decided by the court of session : and by a posterior act, 1609, the session is declared the king's great consistory, with power to review all sentences pronounced by the commissaries. Nevertheless, since that court had no inherent jurisdiction in consistorial causes prior to this statute, and since the statute gives them a power of judging only by way of advocacy, they have not, to this day, any proper consistorial jurisdiction in the first instance; neither do they pronounce sentence in any consistorial cause brought from the commissaries, but remit it back to them with instructions. By the practice immediately subsequent to the act before quoted, they did not admit advocations from the inferior commissaries, till the cause was first brought before the commissaries of Edinburgh; but that practice is now in disuse.

25. The commissaries retain to this day an exclusive power of judging in declarators of marriage, and of the nullity of marriage; in actions of divorce and of non-adherence, of adultery, bastardy, and confirmation of testaments; because all these matters are still considered to be properly consistorial. Inferior commissaries are not competent to questions of divorce, under which are comprehended questions of bastardy and adherence, when they have a connection with the lawfulness of marriage, or with adultery.

26. Commissaries have now no power to pronounce decrees in absence for any sum above L. 40 Scots, except in causes properly consistorial: but they may authenticate tutorial and curatorial inventories; and all bonds, contracts, &c. which contain a clause for registration in the books of any judge competent, and protests on bills, may be registered in their books.

#### SECT. VI. Of marriage.

PERSONS, when considered in a private capacity, are chiefly distinguished by their mutual relations; as husband and wife, tutor and minor, father and child, master and servant. The relation of husband and wife is constituted by marriage; which is the conjunction of man and wife, vowing to live inseparably till death.

2. Marriage is truly a contract, and so requires the consent of parties. Idiots, therefore, and furious persons, cannot marry. As no person is presumed capable of consent within the years of pupillarity, which, by our law, lasts till the age of 14 in males, and 12 in females, marriage cannot be contracted by pupils; but if the married pair should cohabit after puberty, such acquiescence gives force to the marriage. Marriage is fully perfected by consent; which, without consummation, founds all the conjugal rights and duties. The consent requisite to marriage must be *de presenti*. A promise of marriage, (*stipulatio sponsalitia*), may be

resiled from, as long as matters are entire; but if any thing be done by one of the parties, whereby a prejudice arises from the non-performance, the party resiling is liable in damages to the other. The canonists, and after them our courts of justice, explain a *copula* subsequent to a promise of marriage into actual marriage.

3. It is not necessary, that marriage should be celebrated by a clergyman. The consent of parties may be declared before any magistrate, or simply before witnesses: and though no formal consent should appear, marriage is presumed from the cohabitation, or living together at bed and board, of a man and woman who are generally reputed husband and wife. One's acknowledgement of his marriage to the midwife whom he called to his wife, and to the minister who baptized his child, was found sufficient presumptive evidence of marriage, without the aid either of cohabitation, or of *habite et repute*. The father's consent was, by the Roman law, essential to the marriage of children in *familia*: but, by our law, children may enter into marriage, without the knowledge, and even against the remonstrances, of a father.

4. Marriage is forbidden within certain degrees of blood. By the law of Moses, *Leviticus* xviii. which is made ours, seconds in blood, and all remoter degrees, may all lawfully marry. By seconds in blood are meant first cousins. Marriage in the direct line is forbidden in *infinitum*; as it is also in the collateral line in the special case where one of the parties is *loco parentis* to the other, as grand-uncle, great grand-uncle, &c. with respect to his grand-niece, &c. The same degrees that are prohibited in consanguinity, are prohibited in affinity; which is the tie arising from marriage, betwixt one of the married pair, and the blood-relations of the other. Marriage also, where either of the parties is naturally unfit for generation, or stands already married to a third person, is *ipso jure* null.

5. To prevent bigamy and incestuous marriages, the church has introduced proclamation of banns; which is the ceremony of publishing the names and designations of those who intend to intermarry, in the churches where the bride and bridegroom reside, after the congregation is assembled for divine service; that all persons who know any objection to the marriage, may offer it. When the order of the church is observed, the marriage is called *regular*; when otherwise, *clandestine*.

6. By marriage, a society is created between the married pair, which draws after it a mutual communion of their civil interests, in as far as is necessary for maintaining it. As the society lasts only for the joint lives of the *socii*; therefore rights that have the nature of a perpetuity, which our law styles *heritable*, are not brought under the partnership or communion of goods; as a land-estate, or bonds bearing a yearly interest: it is only moveable subjects, or the fruits produced by heritable subjects during the marriage, that become common to man and wife.

7. The husband, as the head of the wife, has the sole right of managing the goods in communion, which is called *jus mariti*. This right is so absolute, that it bears but little resemblance to a right of administering a common subject. For the husband can, in virtue

Law of  
Scotland.

Law of  
Scotland.

thereof, full, or even gift, at his pleasure, the whole goods falling under communion; and his creditors may affect them for the payment of his proper debts: so that the *jus mariti* carries all the characters of an assignation, by the wife to her husband, of her moveable estate. It arises *ipso jure* from the marriage; and therefore needs no other constitution. But a stranger may convey an estate to a wife, so as it shall not be subject to the husband's administration; or the husband himself may, in the marriage-contract, renounce his *jus mariti* in all or any part of his wife's moveable estate.

Parapher-  
nalia.

8. From this right are excepted paraphernal goods, which, as the word is understood in our law, comprehends the wife's wearing apparel, and the ornaments proper to her person, as necklaces, ear-rings, breast or arm jewels, buckles, &c. These are neither alienable by the husband, nor affectable by his creditors. Things of promiscuous use to husband and wife, as plate, medals, &c. may become paraphernal, by the husband's giving them to the wife, at or before marriage; but they are paraphernal only in regard to that husband who gave them as such, and are esteemed common moveables, if the wife, whose *paraphernalia* they were, be afterwards married to a second husband; unless he shall in the same manner appropriate them to her.

Burdens af-  
fecting the  
*jus mariti*.

9. The right of the husband to the wife's moveable estate, is burdened by the moveable debts contracted by her before marriage: and as his right is universal, so is his burden; for it reaches to her whole moveable debts, though they should far exceed her moveable estate. Yet the husband is not considered as the true debtor in his wife's debts. In all actions for payment, she is the proper defender: the husband is only cited for his interest, that is, as curator to her, and administrator of the society-goods. As soon therefore as the marriage is dissolved, and the society-goods thereby suffer a division, the husband is no farther concerned in the share belonging to his deceased wife; and consequently is no longer liable to pay her debts, which must be recovered from her representatives, or her separate estate.

How ex-  
tended a-  
gainst the  
husband.

10. This obligation upon the husband is perpetuated against him, (1.) Where his proper estate, real or personal, has been affected, during the marriage, by complete legal diligence; in which case, the husband must, by the common rules of law, relieve his property from the burden with which it stands charged: but the utmost diligence against his person, is not sufficient to perpetuate the obligation; nor even incomplete diligence against his estate. (2.) The husband continues liable, even after the wife's death, in so far as he is *lucratus* or profited by her estate. As he was at no time the proper debtor in his wife's moveable debts; therefore, though he should be *lucratus*, he is, after the dissolution, only liable for them *subsidiarie*, i. e. if her own separate estate is not sufficient to pay them off.

11. Where the wife is debtor in that sort of debt, which, if it had been due to her, would have excluded the *jus mariti*, e. g. in bonds bearing interest, the husband is liable only for the bygone interests, and those that may grow upon the debt during the marriage; because his obligation for her debts must be commensu-

rated to the interest he has in her estate. It is the husband alone who is liable in personal diligence for his wife's debts, while the marriage subsists: the wife, who is the proper debtor, is free from all personal execution upon them while she is *vestita viro*.

12. The husband by marriage becomes the perpetual curator of the wife. From this right it arises, 1. That no suit can proceed against the wife, till the husband be cited for his interest. 2. All deeds, done by a wife without the husband's consent, are null; neither can she sue in any action without the husband's concurrence. Where the husband refuses, or by reason of forfeiture, &c. cannot concur; or where the action is to be brought against the husband himself, for performing his part of the marriage-articles; the judge will authorise her to sue in her own name. The effects arising from this curatorial power discover themselves even before marriage, upon the publication of banns; after which the bride, being no longer *sui juris*, can contract no debt, nor do any deed, either to the prejudice of her future husband, nor even to her own.

The hus-  
band is the  
wife's cura-  
tor.

13. If the husband should either withdraw from his wife, or turn her out of doors; or if, continuing in family with her, he should by severe treatment endanger her life; the commissaries will authorise a separation *a mensa et thoro*, and give a separate alimony to the wife, suitable to her husband's estate, from the time of such separation, until either a reconciliation or a sentence of divorce.

Separate  
alimony.

14. Certain obligations of the wife are valid, notwithstanding her being *sub cura mariti*; ex. gr. obligations arising from delict; for wives have no privilege to commit crimes. But if the punishment resolves into a pecuniary mulct, the execution of it must, from her incapacity to fulfil, be suspended till the dissolution of the marriage, unless the wife has a separate estate exempted from the *jus mariti*.

What ob-  
ligations of  
the wife  
bind.

15. Obligations arising from contract, affect either the person or the estate. The law has been so careful to protect wives while *sub cura mariti*, that all personal obligations granted by a wife, though with the husband's consent, as bonds, bills, &c. are null; with the following exceptions: (1.) Where the wife gets a separate *peculium* or stock, either from her father or a stranger, for her own or her children's alimony, she may grant personal obligations in relation to such stock; but by stronger reason, personal obligations granted by a wife are good, when her person is actually withdrawn from the husband's power by a judicial separation. (2.) A wife's personal obligation, granted in the form of a deed *inter vivos*, is valid, if it is not to take effect till her death. (3.) Where the wife is by the husband *præposita negotiis*, intrusted with the management, either of a particular branch of business, or of his whole affairs, all the contracts she enters into in the exercise of her *præpositura* are effectual, even though they be not reduced to writing, but should arise merely *ex re*, from furnishings made to her: but such obligations have no force against the wife; it is the husband only, by whose commission she acts, who is thereby obliged.

16. A wife, while she remains in family with her husband, is considered as *præposita negotiis domesticis*; and consequently may provide things proper for the family;

revocable  
and irrev-  
ocable.

Ratification  
by wives.

mily; for the price whereof the husband is liable, tho' they should be misapplied, or though the husband should have given her money to provide them elsewhere. A husband who suspects that his wife may hurt his fortune by high living, may use the remedy of inhibition against her; by which all persons are inter-  
pelled from contracting with her, or giving her credit. After the completing of this diligence, whereby the *praepostura* falls, the wife cannot bind the husband, un-  
less for such reasonable furnishings as he cannot in-  
struct that he provided her with *aliunde*. As every man, and consequently every husband, has a right to remove his managers at pleasure, inhibition may pass at the  
suit of the husband against the wife, though he should not offer to justify that measure by an actual proof of the extravagance or profusion of her temper.

17. As to rights granted by the wife affecting her estate; she has no moveable estate, except her *paraphernalia*; and these she may alien or impignorate, with consent of the husband. She can, without the husband, bequeath by testament her share of the goods in communion; but she cannot dispose of them *inter vivos*. A wife can lawfully oblige herself, in relation to her heritable estate, with consent of her husband: for though her person is in some sense sunk by the marriage, she continues capable of holding a real estate; and in such obligations, her estate is considered, and not her person. A husband, though he be curator to his wife, can, by his acceptance or intervention, authorise rights granted by her in his own favour: for a husband's curatory is not intended only for the wife's advantage, but is considered as a mutual benefit to both.

18. All donations, whether by the wife to the husband; or by the husband to the wife, are revocable by the donor; but if the donor dies without revocation, the right becomes absolute. Where the donation is not pure, it is not subject to revocation: thus, a grant made by the husband, in consequence of the natural obligation that lies upon him to provide for his wife, is not revocable, unless in so far as it exceeds the measure of a rational settlement; neither are remuneratory grants revocable, where mutual grants are made in consideration of each other, except where an onerous cause is simulated, or where what is given *hinc inde* bears no proportion to each other. All voluntary contracts of separation, by which the wife is provided in an yearly alimony, are effectual as to the time past, but revocable either by the husband or wife.

19. As wives are in the strongest degree subject to the influence of their husbands, third parties, in whose favours they had made grants, were frequently vexed with actions of reduction, as if the grant had been extorted from the wife through the force or fear of the husband. To secure the grantees against this danger, ratifications were introduced, whereby the wife, appearing before a judge, declares upon oath, her husband not present, that she was not induced to grant the deed *ex vi aut metu*. A wife's ratification is not absolutely necessary for securing the grantee: law indeed allows the wife to bring reduction of any deed she has not ratified, upon the head of force or fear; of which, if she brings sufficient evidence, the deed will be set aside; but if she fails in the proof, it will remain effectual to the receiver.

Law of  
Scotland.

Dissolution  
of marriage.

20. Marriage, like other contracts, might, by the Roman law, be dissolved by the contrary consent of parties; but, by the law of Scotland, it cannot be dissolved till death, except by divorce, proceeding either upon the head of adultery, or of wilful desertion.

21. Marriage is dissolved by death, either within year and day from its being contracted, or after year and day. If it is dissolved within year and day, all rights granted in consideration of the marriage (unless guarded against in the contract) become void, and things return to the same condition in which they stood before the marriage: with this restriction, that the husband is considered as a *bona fide* possessor, in relation to what he has consumed upon the faith of his right; but he is liable to repay the tocher, without any deduction in consideration of his family-expence during the marriage. If things cannot be restored on both sides, equity hinders the restoring of one party, and not the other.

22. Upon the dissolution of a marriage, after year and day, the surviving husband becomes the irrevocable proprietor of the tocher; and the wife, where she survives, is intitled to her jointure, or to her legal provisions. She has also right to mournings, suitable to the husband's quality; and to alimony from the day of his death, till the term at which her life rent provision, either legal or conventional, commences. If a living child be procreated of the marriage, the marriage has the same effect as if it had subsisted beyond the year. A day is adjoined to the year, in *majorum eodentiam*, that it may clearly appear that the year itself is elapsed; and therefore, the running of any part of the day, after the year, has the same effect as if the whole were elapsed. The legal right of courtesy competent to the surviving husband is explained below, No clxx. 28.

23. Divorce is such a separation of married persons, during their lives, as looses them from the nuptial tie, and leaves them at freedom to intermarry with others. But neither adultery, nor wilful desertion, are grounds which must necessarily dissolve marriage; they are only handles, which the injured party may take hold of to be free. Cohabitation, therefore, by the injured party, after being in the knowledge of the acts of adultery, implies a passing from the injury; and no divorce can proceed, which is carried on by collusion betwixt the parties, left, contrary to the first institution of marriage, they might disengage themselves by their own consent: and though, after divorce, the guilty person, as well as the innocent, may contract second marriages; yet, in the case of divorce upon adultery, marriage is by special statute prohibited betwixt the two adulterers.

24. Where either party has deserted from the other for four years together, that other may sue for adherence. If this has no effect, the church is to proceed, first by admonition, then by excommunication; all which previous steps are declared to be a sufficient ground for pursuing a divorce. *De praxi*, the commissaries pronounce sentence in the adherence, after one year's desertion; but four years must intervene between the first desertion and the decree of divorce.

25. The legal effects of divorce on the head of desertion are, that the offending husband shall restore the tocher, and forfeit to the wife all her provisions, legal

curatory.

and, conventional; and on the other hand, the offending wife shall forfeit to the husband her tocher, and all the rights that would have belonged to her in the case of her survivance. This was also esteemed the rule in divorces upon adultery. But by a decision of the court of session 1662, founded on a tract of ancient decisions recovered from the records, the offending husband was allowed to retain the tocher.

cixi. SECT. VII. *Of Minors, and their tutors and curators.*

Pupilarity,  
&c.

1. THE stages of life principally distinguished in law are, *pupilarity, puberty or minority, and majority*. A child is under pupilarity, from the birth to 14 years of age if a male, and till 12 if a female. Minority begins where pupilarity ends, and continues till majority; which, by the law of Scotland, is the age of 21 years complete, both in males and females: but minority, in a large sense, includes all under age, whether pupils or *puberes*. Because pupils cannot in any degree act for themselves, and minors seldom with discretion, pupils are put by law under the power of tutors, and minors may put themselves under the direction of curators. Tutory is a power and faculty to govern the person, and administer the estate, of a pupil. Tutors are either nominate, of law, or dative.

Tutors.

2. A tutor nominate is he who is named by a father, in his testament or other writing, to a lawful child. Such tutor is not obliged to give caution for the faithful discharge of his office; because his fidelity is presumed to have been sufficiently known to the father.

Agnates.

3. If there be no nomination by the father, or if the tutors nominate do not accept, or if the nomination falls by death or otherwise, there is place for a tutor of law. This sort of tutory devolves upon the next agnate; by which we understand he who is nearest related by the father, though females intervene.

4. Where there are two or more agnates equally near to the pupil, he who is intitled to the pupil's legal succession falls to be preferred to the others. But as the law suspects, that he may not be over careful to preserve a life which stands in the way of his own interest, this sort of tutory is excluded from the custody of the pupil's person; which is commonly committed to the mother, while a widow, until the pupil be seven years old; and, in default of the mother, to the next cognate, *i. e.* the nearest relation by the mother. The tutor of law must be at least 25 years of age. He is served or declared by a jury of sworn men, who are called upon a brief issuing from the chancery, which is directed to any judge having jurisdiction. He must give security before he enters upon the management.

5. If no tutor of law demands the office, any person, even a stranger, may apply for a tutory-dative. But because a tutor in law ought to be allowed a competent time to deliberate whether he will serve or not, no tutory-dative can be given till the elapsing of a year from the time at which the tutor of law had first a right to serve. It is the king alone, as the father of his country, who gives tutors-dative, by his court of exchequer; and no gift of tutory can pass in exchequer, without the citation or consent of the next of kin to the pupil, both by the father and mother, nor till the tutor give security, recorded in the books of exchequer. There is no room for a tutor of law, or

tutory-dative, while a tutor-nominate can be hoped for: and tutors of law, or dative, even after they have begun to act, may be excluded by the tutor-nominate, as soon as he offers to accept, unless he has expressly renounced the office. If a pupil be without tutors of any kind, the court of session will, at the suit of any kinsman, name a factor (Reward) for the management of the pupil's estate.

6. After the years of pupilarity are over, the minor is considered as capable of acting by himself, if he has confidence enough of his own capacity and prudence. The only two cases in which curators are imposed upon minors are, (1.) Where they are named by the father, in a state of health. (2.) Where the father is himself alive; for a father is *ipso jure*, without any service, administrator, that is, both tutor and curator of law, to his children, in relation to whatever estate may fall to them during their minority. This right in the father does not extend to grandchildren, nor to such even of his immediate children as are forisfamiliarized. Neither has it place in subjects which are left by a stranger to the minor, exclusive of the father's administration. If the minor chuses to be under the direction of the curators, he must raise and execute a summons, citing at least two of his next of kin to appear before his own judge-ordinary, upon nine days warning. At the day and place of appearance, he offers to the judge a list of those whom he intends for his curators: such of them as resolve to undertake the office, must sign their acceptance, and give caution; upon which an act of curatory is extracted.

7. These curators are styled *ad negotia*; to distinguish them from another sort called curators *ad litem*, who are authorized by the judge to concur with a pupil or minor in actions of law, either where he is without tutors and curators, or where his tutors and curators are parties to the suit. This sort is obliged to give caution, because they have no intermeddling with the minor's estate: they are appointed for a special purpose; and when that is over, their office is at an end. Women are capable of being tutors and curators, under the following restrictions: (1.) The office of a female tutor or curator falls by her marriage, even though the nomination should provide otherwise; (2.) No woman can be tutor of law. Pupils are declared incapable of tutory or curatory. Where the minor has more tutors and curators than one, who are called in the nomination to the joint management, they must all concur in every act of administration: where a certain number is named for a quorum, that number must concur: where any one is named *fine quo non*, no act is valid without that one's special concurrence. But if they are named without any of these limitations, the concurrence of the majority of the nominees then alive is sufficient.

8. In this, tutory differs from curatory, that as pupils are incapable of consent, they have no person capable of acting; which defect the tutor supplies: but a minor *pubes* can act for himself. Hence, the tutor subscribes alone all deeds of administration: but in curatory, it is the minor who subscribes as the proper party; the curator does no more than consent. Hence also, the persons of pupils are under the power either of their tutors or of their nearest cognates; but the minor, after pupilarity, has the disposal of his own person, and may reside where he pleases. In most other

par-

Law of Scotland.

Judicial inventories.

particulars, the nature, the powers, and the duties of the two offices coincide. Both tutors and curators must, previous to their administration, make a judicial inventory, subscribed by them and the next of kin, before the minor's judge-ordinary, of his whole estate personal and real; of which, one subscribed duplicate is to be kept by the tutors or curators themselves; another, by the next of kin on the father's side; and a third, by the next of kin on the mother's. If any estate belonging to the minor shall afterwards come to their knowledge, they must add it to the inventory within two months after their attaining possession thereof. Should they neglect this, the minor's debtors are not obliged to make payment to them: they may be removed from their offices as suspected; and they are entitled to no allowance for the sums disbursed by them in the minor's affairs, except the expense laid out upon the minor's entertainment, upon his lands and houses, and upon completing his titles.

Powers of tutors and curators.

9. Tutors and curators cannot grant leases of the minor's lands, to endure longer than their own office; nor under the former rental, without either a warrant from the court of session, or some apparent necessity.

10. They have power to sell the minor's moveables; but cannot sell their pupil's land-estate, without the authority of a judge. But the alienation of heritage by a minor, with consent of his curators, is valid.

11. Tutors and curators cannot, contrary to the nature of their trust, authorise the minor to do any deed for their own benefit; nor can they acquire any debt affecting the minor's estate: and, where a tutor or curator makes such acquisition, in his own name, for a less sum than the right is intitled to draw, the benefit thereof accrues to the minor.

Their obligations.

12. By the Roman law, tutory and curatory, being *munera publica*, might be forced upon every one who has not a relevant ground of excuse; but, with us, the persons named to these offices may either accept or decline: and where a father, in *liege pouste*, names certain persons both as tutors and curators to his children, though they have acted as tutors, they may decline the office of curatory. Tutors and curators having once accepted, are liable in *diligence*, that is, are accountable for the consequences of their neglect in any part of their duty from the time of their acceptance. They are accountable *singuli in solidum*, i. e. every one of them is answerable, not only for his own diligence, but for that of his co-tutors; and any one may be sued without citing the rest: but he who is condemned in the whole, has action of relief against his co-tutors.

13. From this obligation to diligence, we may except, (1.) Fathers or administrators in law, who, from the presumption that they act to the best of their power for their children, are liable only for actual intromissions. (2.) Tutors and curators named by the father, with the special provisos, that they shall be liable barely for intromissions, not for omissions; and that each of them shall be liable only for himself, and not in *solidum* for the co-tutor's: but this power of exemption from diligence, is limited to the estate descending from the father himself. Tutors or curators are not intitled to any salary or allowance for pains, unless a salary has been expressly contained in the testator's nomination; for their office is presumed gratuitous.

14. Though no person is obliged to accept the of-

fice of tutor or curator; yet having once accepted, he cannot throw it up or renounce it without sufficient cause; but, if he should be guilty of misapplying the minor's money, or fail in any other part of his duty, he may be removed at the suit of the minor's next of kin, or by a co-tutor or co-curator. Where the misconduct proceeds merely from indolence or inattention, the court, in place of removing the tutor, either join a curator with him, or, if he be a tutor-nominate, they oblige him to give caution for his past and future management.

15. The offices of tutory and curatory expire also by the pupil's attaining the age of puberty, or the minor's attaining the age of 21 years complete; and by the death either of the minor, or of his tutor and curator.

16. Deeds either by pupils, or by minors having curators without their consent, are null; but they oblige the granters, in as far as relates to sums profitably applied to their use. A minor under curators can indeed make a testament by himself; but whatever is executed in the form of a deed *inter vivos*, requires the curator's consent. Deeds by a minor who has no curators, are as effectual as if he had had curators, and signed them with their consent; he may even alien his heritage, without the interposition of a judge.

Effect of deeds by minors.

17. Minors may be restored against all deeds granted in their minority, that are hurtful to them. Deeds, in themselves void, need not the remedy of restitution; but where hurtful deeds are granted by a tutor in his pupil's affairs, or by a minor who has no curators, as these deeds subsist in law, restitution is necessary: and even where a minor, having curators, executes a deed hurtful to himself with their consent, he has not only action against the curators, but he has the benefit of restitution against the deed itself. The minor cannot be restored, if he does not raise and execute a summons for reducing the deed, *ex capite minorennitatis et lesionis*, before he be 25 years old. These four years, between the age of 21 and 25, called *quadrimum utile*, are indulged to the minor, that he may have a reasonable time, from that period, when he is first presumed to have the perfect use of his reason, to consider with himself what deeds done in his minority have been truly prejudicial to him.

Restitution.

18. Questions of restitution are proper to the court of session. Two things must be proved by the minor, *its requisites*.

in order to the reduction of the deed: (1.) That he was minor when it was signed; (2.) That he is hurt or lesed by the deed. This lesion must not proceed merely from accident; for the privilege of restitution was not intended to exempt minors from the common misfortunes of life; it must be owing to the imprudence or negligence of the minor, or his curator.

19. A minor cannot be restored against his own delict or fraud. (2.) Restitution is excluded, if the minor, at any time after majority, has approved of the deed, either by a formal ratification, or tacitly by payment of interest, or by other acts inferring approbation. (3.) A minor, who has taken himself to business, as a merchant-shopkeeper, &c. cannot be restored against any deed granted by him in the course of that business, especially if he was *proximus majorenitate* at signing the deed. (4.) According to the more common opinion, a minor cannot be restored in a question against a minor, unless some gross unfairness shall be qualified.

qualified in the bargain.

20. The privilege of restitution does not always die with the minor himself. (1.) If a minor succeeds to a minor, the time allowed for restitution is governed by the minority of the heir, not of the ancestor. (2.) If a minor succeeds to a major, who was not full 25, the privilege continues with the heir during his minority; but he cannot avail himself of the *anni utiles*, except in so far as they were unexpired at the ancestor's death. (3.) If a major succeeds to a minor, he has only the *quadrimum utile* after the minor's death; and if he succeeds to a major dying within the *quadrimum*, no more of it can be profitable to him than what remained when the ancestor died.

21. No minor can be compelled to state himself as a defender, in any action, whereby his heritable estate flowing from ascendants may be evicted from him, by one pretending a preferable right.

22. This privilege is intended merely to save minors from the necessity of disputing upon questions of preference. It does not therefore take place, (1.) Where the action is pursued on the father's falsehood or delict. (2.) Upon his obligation to convey heritage. (3.) On his liquid bond for a sum of money, though such action should have the effect to carry off the minor's estate by adjudication. (4.) Nor in actions pursued by the minor's superior, upon feudal casualties. (5.) This privilege cannot be pleaded in bar of an action which had been first brought against the father, and is only continued against the minor; nor where the father was not in the peaceable possession of the heritable subject at his death. Before the minor can plead it, he must be served heir to his father. The persons of pupils are protected from imprisonment on civil debts.

23. Curators are given, not only to minors, but in general to every one who, either through defect of judgment, or unfitness of disposition, is incapable of rightly managing his own affairs. Of the first sort, are idiots and furious persons. Idiots, or *fatui*, are entirely deprived of the faculty of reason. The distemper of the furious person does not consist in the defect of reason; but in an overheated imagination, which obstructs the application of reason to the purposes of life. Curators may be also granted to lunatics; and even to persons dumb and deaf, though they are of sound judgment, where it appears that they cannot exert it in the management of business. Every person, who is come of age, and is capable of acting rationally, has a natural right to conduct his own affairs. The only regular way, therefore, of appointing this sort of curators, is by a jury summoned upon a brief from the chancery; which is not, like the brief of common tutory, directed to any judge-ordinary, but to the judge of the special territory where the person alleged to be fatuous or furious resides; that, if he is truly of sound judgment, he may have an opportunity to oppose it: and, for this reason, he ought to be made a party to the brief. The curatory of idiots and furious persons belongs to the nearest agnate; but a father is preferred to the curatory of his fatuous son, and the husband to that of his fatuous wife, before the agnate.

24. A clause is inserted in the brief, for inquiring how long the fatuous or furious person has been in that condition; and the verdict to be pronounced by the inquest, is declared a sufficient ground, without farther

evidence, for reducing all deeds granted after the period at which it appeared by the proof that the fatuity or furiosity began. But, as fatuous and furious persons are, by their very state, incapable of being obliged, all deeds done by them may be declared void, upon proper evidence of their fatuity at the time of signing, though they should never have been cognosed idiots by an inquest.

25. We have some few instances of the sovereign's giving curators to idiots, where the next agnate did not claim; but such gifts are truly deviations from our law, since they pass without any inquiry into the state of the person upon whom the curatory is imposed. Hence the curator of law to an idiot, serving *quandocunque*, is preferred, as soon as he offers himself, before the curator-dative. This sort of curatory does not determine by the lucid intervals of the person *sub cura*; but it expires by his death, or perfect return to a sound judgment; which last ought regularly to be declared by the sentence of a judge.

26. Persons, let them be ever so profuse, or liable to be imposed upon, if they have the exercise of reason, can effectually oblige themselves, till they are fettered by law. Interdiction is a legal restraint laid upon such persons from signing any deed to their own prejudice, without the consent of their curators or interdictors.

27. There could be no interdiction, by our ancient practice, without a previous inquiry into the person's condition. But as there were few who could bear the shame that attends judicial interdiction, however necessary the restraint might have been, voluntary interdiction has received the countenance of law; which is generally executed in the form of a bond, whereby the grantor obliges himself to do no deed that may affect his estate, without the consent of certain friends therein mentioned. Though the reasons inductive of the bond should be but gently touched in the recital, the interdiction stands good. Voluntary interdiction, tho' it be imposed by the sole act of the person interdicted, cannot be recalled at his pleasure: but it may be taken off, (1.) By a sentence of the court of session, declaring, either that there was, from the beginning, no sufficient ground for the restraint; or that the party is, since the date of the bond, become *rei sui providus*. (2.) It falls, even without the authority of the lords, by the joint act of the person interdicted, and his interdictors, concurring to take it off. (3.) Where the bond of interdiction requires a certain number as a quorum, the restraint ceases, if the interdictors shall be by death reduced to a lesser number.

28. Judicial interdiction is imposed by a sentence of the court of session. It commonly proceeds on an action brought by a near kinsman to the party; and sometimes from the *nobile officium* of the court, when they perceive, during the pendency of a suit, that any of the litigants is, from the facility of his temper, subject to imposition. This sort must be taken off by the authority of the same court that imposed it.

29. An interdiction need not be served against the person interdicted; but it must be executed, or published by a messenger, at the market-cross of the jurisdiction where he resides, by publicly reading the interdiction there, after three oyessees made for convocation the lieges. A copy of this execution must be affixed to the crosses; and thereafter, the interdiction, with

its

its execution, must be registrated in the books, both of the jurisdiction where the person interdicted resides and where his lands lie, or in the general register of the session, within 40 days from the publication. An interdiction, before it is registrated, has no effect against third parties, tho' they should be in the private knowledge of it; but it operates against the interdictors themselves, as soon as it is delivered to them.

30. An interdiction, duly registrated, has this effect, that all deeds done thereafter, by the persons interdicted, without the consent of his interdictors, affecting his heritable estate, are subject to reduction. Registrature in the general register secures all his lands from alienation, wherever they lie; but where the interdiction is recorded in the register of a particular shire, it covers no lauds except those situated in that shire. But persons interdicted have full power to dispose of their moveables, not only by testament, but by present deeds of alienation: And creditors, in personal bonds granted after interdiction, may use all execution against their debtor's person and moveable estate: such bonds being only subject to reduction in so far as diligence against the heritable estate may proceed upon them.

31. All onerous or rational deeds granted by the person interdicted, are as effectual, even without the consent of the interdictors, as if the granter had been laid under no restraint; but he cannot alter the succession of his heritable estate, by any settlement, let it be ever so rational. No deed, granted with consent of the interdictors, is reducible, though the strongest lesion or prejudice to the granter should appear: the only remedy competent, in such case, is an action by the granter against his interdictors, for making up to him what he has lost through their undue consent. It is no part of the duty of interdictors, to receive sums or manage any estate; they are given merely *ad auctoritatem præstandam*, to interpose their authority to reasonable deeds: and so are accountable for nothing but their fraud or fault, in consenting to deeds hurtful to the person under their care.

32. The law concerning the state of children falls next to be explained. Children are either born in wedlock, or out of it. All children, born in lawful marriage or wedlock, are presumed to be begotten by the person to whom the mother is married; and consequently to be lawful children. This presumption is so strongly founded, that it cannot be defeated but by direct evidence that the mother's husband could not be the father of the child, *e. g.* where he is impotent, or was absent from the wife till within six lunar months of the birth. The canonists indeed maintain, that the concurring testimony of the husband and wife that the child was not procreated by the husband, is sufficient to elide this legal presumption for legitimacy: but it is an agreed point, that no regard is to be paid to such testimony, if it be made after they have owned the child to be theirs. A father has the absolute right of disposing of his children's person, of directing their education, and of moderate chastisement; and even after they become *puberes*, he may compel them to live in family with him, and to contribute their labour and industry, while they continue there, towards his service. A child who gets a separate stock from the father for carrying on any trade or employment, even though he

should continue in the father's house, may be said to be emancipated or forisfamiliarized, in so far as concerns that stock; for the profits arising from it are his own. Forisfamiliarization, when taken in this sense, is also inferred by the child's marriage, or by his living in a separate house, with his father's permission or good-will. Children, after their full age of twenty-one years, become, according to the general opinion, their own masters; and from that period are bound to the father only by the natural ties of duty, affection, and gratitude. The mutual obligations between parents and children to maintain each other, are explained afterwards, N<sup>o</sup> clxxiii. 4.

33. Children born out of wedlock, are styled natural children, or bastards. Bastards may be legitimated or made lawful, either, (1.) By the subsequent intermarriage of the mother of the child with the father. And this sort of legitimation intitles the child to all the rights of lawful children. The subsequent marriage, which produces legitimation, is considered by the law to have been entered into when the child legitimated was begotten: and hence, if he be a male, he excludes, by his right of primogeniture, the sons procreated after the marriage, from the succession of the father's heritage, though these sons were lawful children from the birth. Hence, also, those children only can be thus legitimated, who are begotten of a woman whom the father might at that period have lawfully married. (2.) Bastards are legitimated by letters of legitimation from the sovereign. N<sup>o</sup> clxxiii. 3.

34. As to the power of masters over their servants: Servants. All servants now enjoy the same rights and privileges with other subjects, unless in so far as they are tied down by their engagements of service. Servants are either necessary or voluntary. Necessary are those whom law obliges to work without wages, of whom immediately. Voluntary servants engage without compulsion, either for mere subsistence, or also for wages. Those who earn their bread in this way, if they should stand off from engaging, may be compelled to it by the justices of the peace, who have power to fix the rate of their wages.

35. Colliers, coal-bearers, and salters, and other persons necessary to collieries and saltworks, as they are particularly described by act 1661, were formerly tied down to perpetual service at the works to which they had once entered. Upon a sale of the works, the right of their service was transferred to the new proprietor. All persons were prohibited to receive them into their service, without a testimonial from their last master; and if they deserted to another work, and were redemanded within a year thereafter, he who had received them was obliged to return them within twenty-four hours, under a penalty. But though the proprietor should neglect to require the deserter within the year, he did not, by that short prescription, lose his property in him. Colliers, &c. where the colliery to which they were restricted was either given up, or not sufficient for their maintenance, might lawfully engage with others; but if that work should be again set a-going, the proprietor might reclaim them back to it.

36. By 15 Geo. III. c. 28. these restraints, the only remaining vestiges of slavery in the law of Scotland, are abrogated; and, after the 18 July 1775, all colliers, coal-bearers, and salters, are declared to be upon the

Bastards.

Servants.

off.

Law of Scotland.

the same footing with other servants or labourers. The act subjects those who were bound prior to the 1st July 1775, to a certain number of years service for their freedom, according to the age of the person.

The poor.

37. The poor make the lowest class or order of persons. Indigent children may be compelled to serve any of the king's subjects without wages, till their age of thirty years. Vagrants and sturdy beggars may be also compelled to serve any manufacturer. And because few persons were willing to receive them into their service, public work-houses are ordained to be built for setting them to work. The poor who cannot work, must be maintained by the parishes in which they were born; and where the place of their nativity is not known, that burden falls upon the parishes where they have had their most common resort, for the three years immediately preceding their being apprehended or their applying for the public charity. Where the contributions collected at the churches to which they belong, are not sufficient for their maintenance, they are to receive badges from the minister and kirk-session, in virtue of which they may ask alms at the dwelling-houses of the inhabitants of the parish.

## C H A P. II.

## OF THINGS.

THE things, or subjects, to which persons have right, are the second object of law.

cxlii.

SECT. I. *Of the division of rights, and the several ways by which a right may be acquired.*

Property.

THE right of enjoying and disposing of a subject at one's pleasure, is called property. Proprietors are restrained by law from using their property emulously to their neighbour's prejudice. Every state or sovereign has a power over private property, called, by some lawyers, *dominium eminens*, in virtue of which, the proprietor may be compelled to sell his property for an adequate price, where an evident utility on the part of the public demands it.

Things incapable of appropriation.

2. Certain things are by nature itself incapable of appropriation; as the air, the light, the ocean, &c.: none of which can be brought under the power of any one person, though their use be common to all. Others are by law exempted from private commerce, in respect of the uses to which they are destined. Of this last kind are, (1.) *Res publicæ*, as navigable rivers, highways, bridges, &c.: the right of these is vested in the king, chiefly for the benefit of his people, and they are called *regalia*. (2.) *Res universitatis*, things which belong in property to a particular corporation or society, and whose use is common to every individual in it, but both property and use are subject to the regulations of the society; as town-houses, corporation-halls, market-places, church-yards, &c. The lands or other revenue belonging to a corporation do not fall under this class, but are *juris privati*.

Ways of acquiring Property.

3. Property may be acquired, either by occupation or accession; and transferred by tradition or prescription: but prescription, being also a way of losing property, falls to be explained under a separate title. Occupation, or occupancy, is the appropriating of things which have no owner, by apprehending them, or seiz-

ing their possession. This was the original method of acquiring property; and continued, under certain restrictions, the doctrine of the Roman law, *Quod nullius est, fit occupantis*: but it can have no room in the feudal plan, by which the king is looked on as the original proprietor of all the lands within his dominions.

4. Even in that sort of moveable goods which are presumed to have once had an owner, this rule obtains by the law of Scotland, *Quod nullius est, fit domini regis*. Thus, the right of treasures hid under ground, is not acquired by occupation, but accrues to the king. Thus also, where one finds strayed cattle or other moveables, which have been lost by the former owner, the finder acquires no right in them, but must give public notice thereof; and if, within year and day after such notice, the proprietor does not claim his goods, they fall to the king, sheriff, or other person to whom the king has made a grant of such escheats.

5. In that sort of moveables which never had an owner, as wild-beasts, fowls, fishes, or pearls found on the shore, the original law takes place, that he who first apprehends, becomes proprietor; in so much, that though the right of hunting, fowling, and fishing, be restrained by statute, under certain penalties, yet all game, even what is caught in contravention of the law, becomes the property of the catcher, unless where the confiscation thereof is made part of the penalty: but whales thrown in or killed on our coasts, belong neither to those who kill them, nor to the proprietor of the grounds on which they are cast; but to the king, providing they are so large as that they cannot be drawn by a wane with six oxen.

6. Accession is that way of acquiring property, by which, in two things which have a connection with or dependence on one another, the property of the principal thing draws after it the property of its accessory. Thus the owner of a cow becomes the owner of the calf; a house belongs to the owner of the ground on which it stands, though built with materials belonging to and at the charge of another; trees taking root in our ground, though planted by another, become ours. Thus also, the insensible addition made to one's ground by what a river washes from other grounds, which is called *alluvio*, accrues to the master of the ground which receives the addition. The Romans excepted from this rule the case of paintings drawn on another man's board or canvas, in consideration of the excellency of the art; which exception our practice has for a like reason extended to similar cases.

7. Under accession is comprehended SPECIFICATION; Specification, by which is meant, a person's making a new species or subject, from materials belonging to another. Where the new species can be again reduced to the matter of which it was made, law considers the former mass as still existing; and therefore, the new species, as an accessory to the former subject, belongs to the proprietor of that subject: but where the thing made cannot be so reduced, as in the case of wine, which cannot be again turned into grapes, there is no place for the *res juris*; and therefore the workmanship draws after it the property of the materials.

8. Though the new species should be produced from Commixtion, or confusion of different substances belonging to different proprietors, the same rule holds; but where the mixture is made by the common consent

Law of Scotland.

Accession.

Specification.

of

of the owners, such consent makes the whole a common property, according to the shares that each proprietor had formerly in the several subjects. Where things of the same sort are mixed without the consent of the proprietors, which cannot again be separated, *e.g.* two hogheads of wine, the whole likewise becomes a common property; but, in the after-division, regard ought to be had to the different quality of the wines: if the things so mixed admit of a separation, *e.g.* two flocks of sheep, the property continues distinct.

Tradition.

9. Property is carried from one to another by **TRADITION**; which is the delivery of possession by the proprietor, with an intention to transfer the property to the receiver. Two things are therefore requisite, in order to the transmitting of property in this way: 1. The intention or consent of the former owner to transfer it on some proper title of alienation, as sale, exchange, gift, &c. (2.) The actual delivery in pursuance of that intention. The first is called the *causa*, the other the *modus transferendi domini*: which last is so necessary to the acquiring of property, that he who gets the last right, with the first tradition, is preferred, according to the rule, *Traditionibus, non nudis pactis, transferuntur rerum dominia*.

10. Tradition is either real, where the *ipsa corpora* of moveables are put into the hands of the receiver; or symbolical, which is used where the thing is incapable of real delivery, or even when actual delivery is only inconvenient. Where the possession or custody of the subject has been before with him to whom the property is to be transferred, there is no room for tradition.

Possession;

11. Possession, which is essential both to the acquisition and enjoyment of property, is defined, the detention of a thing, with a design or *animus*; in the detainer of holding it as his own. It cannot be acquired by the sole act of the mind, without real detention; but, being once acquired, it may be continued *solo animo*. Possession is either natural, or civil. Natural possession is, when one possesses by himself: thus, we possess lands by cultivating them and reaping their fruits, houses by inhabiting them, moveables by detaining them in our hands. Civil possession is our holding the thing, either by the sole act of the mind, or by the hands of another who holds it in our name: thus, the owner of a thing lent possesses it by the borrower; the proprietor of lands, by his tackman, trustee, or steward; &c. The same subject cannot be possessed entirely, or *in solidum*, by two different persons at one and the same time; and therefore possession by an act of the mind ceases, as soon as the natural possession is so taken up by another, that the former possessor is not suffered to re-enter. Yet two persons may, in the judgment of law, possess the same subject, at the same time, on different rights: thus, in the case of a pledge, the creditor possesses it in his own name, in virtue of the right of impignoration; while the proprietor is considered as possessing, in and through the creditor, in so far as necessary for supporting his right of property. The same doctrine holds in liciters, tackmen, and, generally, in every case where there are rights affecting a subject, distinct from the property.

Bona fide.

12. A *bona fide* possessor is he, who, though he is not really proprietor of the subject, yet believes himself proprietor on probable grounds. A *mala fide* possessor knows, or is presumed to know, that what he possesses

is the property of another. A possessor *bona fide* acquired right, by the Roman law, to the fruits of the subject possessed, that had been reaped and consumed by himself, while he believed the subjects his own. By our customs, perception alone, without contumption, secures the possessor: nay, if he has sown the ground, while his *bona fides* continued, he is intitled to reap the crop, *propter curam et culturam*. But this doctrine does not reach to civil fruits, *e.g.* the interest of money, which the *bona fide* receiver must restore, together with the principal, to the owner.

13. *Bona fides* necessarily ceaseth by the *consentientia rei alienæ* in the possessor, whether such conscientiousness should proceed from legal interpellation, or private knowledge. *Mala fides* is sometimes induced, by the true owner's bringing his action against the possessor, sometimes not till litigation, and, in cases uncommonly favourable, not till sentence be pronounced against the possessor.

14. The property of moveable subjects is presumed by the bare effect of possession, until the contrary be proved; but possession of an immoveable subject, tho' for a century of years together, if there is no feisin, does not create even a presumptive right to it: *Nulla sasina, nulla terra*. Such subject is considered as caducuary, and so accrues to the sovereign. Where the property of a subject is contested, the lawful possessor is intitled to continue his possession, till the point of right be discussed; and, if he has lost it by force or stealth, the judge will, upon summary application, immediately restore it to him.

15. Where a possessor has several rights in his person, affecting the subject possessed, the general rule is, that he may ascribe his possession to which of them he pleases; but one cannot ascribe his possession to a title other than that on which it commenced, in prejudice of him from whom his title flowed.

## SECT. II. Of heritable and moveable rights.

cxlili.

For the better understanding the doctrine of this title, it must be known, that by the law of Scotland, and indeed of most nations of Europe since the introduction of feus, where-ever there are two or more in the same degree of consanguinity to one who dies intestate, and who are not all females, such rights belonging to the deceased as are either properly feudal, or have any resemblance to feudal rights, descend wholly to one of them, who is considered as his proper heir; the others, who have the name of next of kin or executors, must be contented with that portion of the estate which is of a more perishable nature. Hence has arisen the division of rights to be explained under this title: the subjects descending to the heir, are styled heritable; and those that fall to the next of kin, moveable.

2. All rights of, or affecting lands, under which are comprehended houses, mills, fishings, teinds; and all rights of subjects that are *fundo annexæ*, whether completed by *seisin* or not; are heritable *ex sua natura*. On the other hand, every thing that moves itself or can be moved, and in general whatever is not united to land, is moveable: as household-furniture, corns, cattle, cash, arrears of rent and of interest, even tho' they should be due on a right of annualrent: for though the arrears last mentioned are secured on land, yet being presently payable, they are considered as cash.

[ h ]

3. Debts,

Law of  
Scotland.

3. Debts, (*nomina debitorum*), when due by bill, promissory note, or account, are moveable. When constituted by bond, they do not all fall under any one head; but are divided into heritable and moveable, by the following rules. All debts constituted by bond bearing an obligation to infect the creditor in any heritable subject in security of the principal sum and annualrent, or annualrent only, are heritable; for they not only carry a yearly profit, but are secured upon land.

4. Bonds merely personal, though bearing a clause of interest, are moveable as to succession; i. e. they go not to the heir, but to the next of kin or executors; but they are heritable with respect to the filk, and to the rights of husband and wife; that is, though, by the general rule, moveable rights fall under the communion of goods consequent upon marriage, and the moveables of denounced persons fall to the crown or filk, by single escheat, yet such bonds do neither, but are heritable in both respects.

5. Bonds taken payable to heirs and assignees, secluding executors, are heritable in all respects, from the destination of the creditor. But a bond, which is made payable to heirs, without mention of executors, descends, not to the proper heir in heritage, though heirs are mentioned in the bond, but to the executor; for the word *heir*, which is a generic term, points out him who is to succeed by law in the right; and the executor, being the heir *in mobilibus*, is considered as the person to whom such bond is taken payable. But where a bond is taken to heirs-male, or to a series of heirs, one after another, such bond is heritable, because its destination necessarily excludes executors.

6. Subjects originally moveable become heritable, (1.) By the proprietor's destination. Thus, a jewel, or any other moveable subject, may be provided to the heir, from the right competent to every proprietor to settle his property on whom he pleases. (2.) Moveable rights may become heritable, by the supervening of an heritable security: Thus, a sum due by a personal bond becomes heritable, by the creditor's accepting an heritable right for securing it, or by adjudging upon it.

7. Heritable rights do not become moveable by accessory moveable securities; the heritable right being in such case the *jus nobiliss*, which draws the other after it.

8. Certain subjects partake, in different respects, of the nature both of heritable and moveable. Personal bonds are moveable in respect of succession; but heritable as to the filk, and husband and wife. All bonds, whether merely personal, or even heritable, on which no *seisin* has followed, may be affected at the suit of creditors, either by adjudication, which is a diligence proper to heritage; or by arrestment, which is peculiar to moveables. Bonds secluding executors, though they descend to the creditor's heir, are payable by the debtor's executors, without relief against the heir; since the debtor's succession cannot be affected by the destination of the creditor.

9. All questions, whether a right be heritable or moveable, must be determined according to the condition of the subject at the time of the ancestor's death. If it was heritable at that period, it must belong to the heir; if moveable, it must fall to the executor, without

regard to any alterations that may have affected the subject in the intermediate period between the ancestor's death and the competition.

## I. HERITABLE RIGHTS.

### SECT. III. Of the constitution of heritable rights by charter and *seisin*.

clxiv.

HERITABLE rights are governed by the feudal law, which owed its origin, or at least its first improvements, to the Longobards; whose kings, upon having penetrated into Italy, the better to preserve their conquests, made grants to their principal commanders of great part of the conquered provinces, to be again subdivided by them among the lower officers, under the conditions of fidelity and military service.

Origin of the feudal law.

2. The feudal constitutions and usages were first reduced into writing, about the year 1150, by two lawyers of Milan, under the title of *Constitutiones Feudorum*. None of the German Emperors appear to have expressly confirmed this collection by their authority; but it is generally agreed, that it had their tacit approbation, and was considered as the customary feudal law of all the countries subject to the empire. No other country has ever acknowledged these books for their law; but each state has formed to itself such a system of feudal rules, as best agreed with the genius of its own constitution. In feudal questions, therefore, we are governed, in the first place, by our own statutes and customs; where these fail us, we have regard to the practice of neighbouring countries, if the genius of their law appears to be the same with ours; and should the question still remain doubtful, we may have recourse to those written books of the feus, as to the original plan on which all feudal systems have proceeded.

3. This military grant got the name, first of *beneficium*, and afterwards of *feudum*; and was defined a gratuitous right to the property of lands, made under the conditions of fealty and military service, to be performed to the grantor by the receiver; the radical right of the lands still remaining in the grantor. Under lands, in this definition, are comprehended all rights or subjects so connected with land, that they are deemed a part thereof; as houses, mills, fishings, jurisdictions, patronages, &c. Though feus in their original nature were gratuitous, they soon became the subject of commerce; services of a civil or religious kind were frequently substituted in place of military; and now, of a long time, services of every kind have been entirely dispensed with, in certain feudal tenures. He who makes the grant is called the *superior*, and he who receives it the *vassal*. The subject of the grant is commonly called the *feus*; though that word is at other times, in our law, used to signify one particular tenure. See Sect. iv. 2. The interest retained by the superior in the feus is styled *dominium directum*, or the superiority; and the interest acquired by the vassal, *dominium utile*, or the property. The word *fee* is promiscuously applied to both.

Definition of feus.

4. Allodial goods are opposed to feus; by which are Allodial understood, goods enjoyed by the owner, independent goods of a superior. All moveable goods are allodial; lands only are so when they are given without the condition of fealty or homage. By the feudal system, the sovereign, who is the fountain of feudal rights, reserves to himself

How moveable rights become heritable.

Rights partly heritable, partly moveable.

What period makes a subject heritable or moveable.

Law of  
Scotland.

himself the superiority of all the lands of which he makes the grant ; so that, with us, no lands are allodial, except those of the king's own property, the superiorities which the king reserves in the property-lands of his subjects, and manes and glebes, the right of which is completed by the presbytery's designation, without any feudal grant.

Who can  
grant feudal  
rights.

5. Every person who is in the right of an immovable subject, provided he has the free administration of his estate, and is not debarred by statute, or by the nature of his right, may dispose of it to another. Nay, a vassal, though he has only the *dominium utile*, can subfeu his property to a subvassal by a subaltern right, and thereby raise a new *dominium directum* in himself, subordinate to that which is in his superior ; and so *in infinitum*. The vassal who thus subfeus is called the subvassal's immediate superior, and the vassal's superior is the subvassal's mediate superior.

Who can  
receive  
them.

6. All persons who are not disabled by law, may acquire and enjoy feudal rights. Papists cannot purchase a land estate by any voluntary deed. Aliens, who owe allegiance to a foreign prince, cannot hold a feudal right without naturalization: and therefore, where such privilege was intended to be given to favoured nations or persons, statutes of naturalization were necessary, either general or special; or at least, letters of naturalization by the sovereign.

What sub-  
jects can be  
granted in  
feu.

7. Every heritable subject, capable of commerce, may be granted in feu. From this general rule is excepted, 1. The annexed property of the Crown, which is not alienable without a previous dissolution in parliament. 2. Tailized lands, which are devised under condition that they shall not be aliened. 3. An estate in *hereditate jacente* cannot be effectually aliened by the heir-apparent (*i. e.* not entered); but such alienation becomes effectual upon his entry, the supervening right accruing in that case to the purchaser; which is a rule applicable to the alienation of all subjects not belonging to the vender at the time of the sale.

Feudal  
charter.

8. The feudal right, or, as it is called, *investiture*, is constituted by charter and seisin. By the charter, we understand that writing which contains the grant of the feudal subject to the vassal, whether it be executed in the proper form of a charter, or of a disposition. Charters by subject-superiors are granted, either, 1. *A me de superiore meo*, when they are to be holden, not of the grantor himself, but of his superior. This sort is called a *public holding*, because vassals were in ancient times publicly received in the superior's court before the *pares curie* or co-vassals. Or, 2. *De me*, where the lands are to be holden of the grantor. These were called sometimes *base rights*, from *bas*, *lower*: and sometimes *private*, because, before the establishment of our records, they were easily concealed from third parties; the nature of all which will be more fully explained, Sect. vii. An original charter is that by which the fee is first granted; A charter by progress is a renewed disposition of that fee to the heir or assigney of the vassal. All doubtful clauses in charters by progress ought to be construed agreeably to the original grant; and all clauses in the original charter are understood to be implied in the charters by progress, if there be no express alteration.

Its consti-  
tuent parts.

9. The first clause in an original charter, which follows immediately after the name and designation of the

grantor, is the narrative or recital, which expresses the causes inductive of the grant. If the grant be made for a valuable consideration, it is said to be onerous; if for love and favour, gratuitous. In the dispositive clause of a charter, the subjects made over are described either by special boundaries or marches-stones, (which is called a *bounding charter*), or by such other characters as may sufficiently distinguish them. A charter regularly carries right to no subjects but what are contained in this clause, though they should be mentioned in some other clause of the charter.

Law of  
Scotland.

10. The clause of *tenendas* (from its first words *tenendas predictas terras*) expresses the particular tenure by which the lands are to be holden. The clause of *reddendo* (from the words, *reddendo inde annuatim*) specifies the particular duty or service which the vassal is to pay or perform to the superior.

11. The clause of warrandice is that by which the grantor obliges himself that the right conveyed shall be effectual to the receiver. Warrandice is either personal or real. Personal warrandice, where the grantor is only bound personally, is either, 1. Simple, that he shall grant no deed in prejudice of the right; and this sort, which is confined to future deeds, is implied even in donations. 2. Warrandice from fact and deed, by which the grantor warrants that the right neither has been, nor shall be, hurt by any fact of his. Or, 3. Absolute warrandice *contra omnes mortales*, whereby the right is warranted against all legal defects in it which may carry it off from the receiver either wholly or in part. Where a sale of lands proceeds upon an onerous cause, the grantor is liable in absolute warrandice, though no warrandice be expressed; but in assignments to debts or decrees, no higher warrandice than from fact and deed is implied.

Warran-  
dice.

12. Gratuitous grants by the Crown imply no warrandice; and though warrandice should be expressed, the clause is ineffectual, from a presumption that it has crept in by the negligence of the Crown's officers. But where the Crown makes a grant, *not jure coronæ*, but for an adequate price, the sovereign is in the same case with his subjects.

13. Absolute warrandice, in case of eviction, affords an action to the grantee, against the grantor, for making up to him all that he shall have suffered through the defect of the right; and not simply for his indemnification, by the grantor's repayment of the price to him. But as warrandice is penal, and consequently *stricti juris*, it is not easily presumed, nor is it incurred from every light servitude that may affect the subject, far less does it extend to burdens which may affect the subject posterior to the grant, nor to those imposed by public statute, whether before or after, unless specially warranted against.

Effects of  
warrandice.

14. Real warrandice is either, 1. Express, whereby, in security of the lands principally conveyed, other lands called *warrandice-lands*, are also made over, to which the receiver may have recourse in case the principal lands be evicted. Or, 2. Tacit, which is constituted by the exchange or exambion of one piece of ground with another; for, if the lands exchanged are carried off from either of the parties, the law itself, without any paction, gives that party immediate recourse upon his own first lands, given in exchange for the lands evicted.

Real war-  
randice.

Exambi-  
ground.

**Law of Scotland.** 15. The charter concludes with a precept of feisin, which is the command of the superior grantor of the right to his bailie, for giving feisin or possession to the vassal, or his attorney, by delivering to him the proper symbols. Any person, whose name may be inserted in the blank, left in the precept for that purpose, can execute the precept as bailie; and whoever has the precept of feisin in his hands, is presumed to have a power of attorney from the vassal for receiving possession in his name.

**Instrument of feisin.** 16 A feisin is the instrument or attestation of a notary, that possession was actually given by the superior or his bailie, to the vassal or his attorney; which is considered as so necessary a solemnity, as not to be suppliable, either by a proof of natural possession, or even of the special fact that the vassal was duly entered to the possession by the superior's bailie.

**Symbols used in feisins.** 17. The symbols by which the delivery of possession is expressed, are, for lands, earth and stone; for rights of annualrent payable forth of land, it is also earth and stone with the addition of a penny money; for parsonage teinds, a sheaf of corn; for jurisdictions, the book of the court; for patronages, a psalm-book, and the keys of the church; for fishings, net and coble; for mills, clap and happer, &c. The feisin must be taken upon the ground of the lands, except where there is a special dispensation in the charter from the Crown.

**Registration of feisins.** 18. All feisins must be registered within sixty days after their date, either in the general register of feisins at Edinburgh, or in the register of the particular shire appointed by the act 1617; which, it must be observed, is not, in every case, the shire within which the lands lie. Burgage feisins are ordained to be registered in the books of the burrough.

19. Unregistered feisins are ineffectual against third parties, but they are valid against the grantors and their heirs. Feisins regularly recorded, are preferable, not according to their own dates, but the dates of their registration.

**One feisin serves in contiguous and in united tenements.** 20. Feisin necessarily supposes a superior by whom it is given; the right therefore which the sovereign, who acknowledges no superior, has over the whole lands of Scotland, is constituted, *jure coronæ*, without feisin. In several parcels of land that lie contiguous to one another, one feisin serves for all, unless the right of the several parcels be either held of different superiors, or derived from different authors, or enjoyed by different tenures under the same superior. In discontinuous lands, a separate feisin must be taken on every parcel, unless the sovereign has united them into one tenantry by a charter of union; in which case, if there is no special place expressed, a feisin taken on any part of the united lands will serve for the whole, even though they be situated in different shires. The only effect of union is, to give the discontinuous lands the same quality as if they had been contiguous or naturally united; union, therefore, does not take off the necessity of separate feisins, in lands holden by different tenures, or the rights of which flow from different superiors, these being incapable of natural union.

**Barony implies union.** 21. The privilege of barony carries a higher right than union does, and consequently includes union in it as the lesser degree. This right of barony can neither be given, nor transmitted, unless by the Crown; but the quality of simple union, being once conferred on

lands by the sovereign, may be communicated by the vassal to a subvassal. Though part of the lands united or erected into a barony be sold by the vassal to be holden *a me*, the whole union is not thereby dissolved: what remains unsold retains the quality.

22. A charter, not perfected by feisin, is a right merely personal, which does not transfer the property, (see N<sup>o</sup> clxxiii. 1.); and a feisin of itself bears no faith, without its warrant: It is the charter and feisin joined together that constitutes the feudal right, and secures the receiver against the effect of all posterior feisins, even though the charters on which they proceed should be prior to his.

23. No quality which is designed as a lien or real burden on a feudal right, can be effectual against singular successors, if it be not inserted in the investiture. If the creditors in the burden are not particularly mentioned, the burden is not real; for no perpetual unknown incumbrance can be created upon lands. Where the right itself is granted with the burden of the sum therein mentioned, or where it is declared void if the sum be not paid against a day certain, the burden is real; but where the receiver is simply obliged by his acceptance to make payment, the clause is effectual only against him and his heirs.

#### SECT. IV. *Of the several kinds of Holding.*

**F**EUDAL subjects are chiefly distinguished by their different manners of holding, which were either ward, blanch, feu, or burgage. Ward-holding, which is now abolished by 20 Geo. II. c. 50. was that which was granted for military service. Its proper *reddendo* was, *services*, or *services used and wont*; by which last was meant the performance of service whenever the superior's occasions required it. As all feudal rights were originally held by this tenure, ward-holding was in *dubio* presumed. Hence, though the *reddendo* had contained some special service, or yearly duty, the holding was presumed ward, if another holding was not particularly expressed.

2. Feu-holding is that whereby the vassal is obliged to pay to the superior a yearly rent in money or grain, and sometimes also in services proper to a farm, as ploughing, reaping, carriages for the superior's use, &c. *nomine feudi firmæ*. This kind of tenure was introduced for the encouragement of agriculture, the improvement of which was considerably obstructed by the vassal's obligation to military service. It appears to have been a tenure known in Scotland as far back as *leges burgorum*.

3. Blanch-holding is that whereby the vassal is to pay to the superior an ensory yearly duty, as a penny money, a rose, a pair of gilt spurs, &c. merely in acknowledgment of the superiority, *nomine alba firmæ*. This duty, where it is a thing of yearly growth, if it be not demanded within the year, cannot be exacted thereafter; and where the words, *si petatur tantum*, are subjoined to the *reddendo*, they imply a release to the vassal, whatever the quality of the duty may be; if it is not asked within the year.

4. Burgage-holding is that, by which borough-royal hold of the sovereign the lands which are contained in their charters of erection. This, in the opinion of *Craig*, does not constitute a separate tenure, but

**Law of Scotland.**

A charter becomes real only after feisin.

All burden must be inserted in the investiture.

clxv.

Ward-holding.

Feu-holding.

Blanch-holding.

Burgage-holding.

but is a species of ward-holding; with this speciality, that the vassal is not a private person, but a community; and indeed, watching and warding, which is the usual service contained in the *reddendo*: of such charters, might be properly enough said, some centuries ago, to have been of the military kind. As the royal borough is the king's vassal, all burghage-holders hold immediately of the crown: the magistrates therefore, when they receive the reliquians of the particular burghesses, and give seisin to them, act, not as superiors, but as the king's bailies specially authorized thereto.

5. Feudal subjects, granted to churches, monasteries, or other societies for religious or charitable uses, are said to be mortified, or granted *ad manum mortuam*; either because all casualties must necessarily be lost to the superior, where the vassal is a corporation, which never dies; or because the property of these subjects is granted to a dead hand, which cannot transfer it to another. In lands mortified in times of Popery to the church, whether granted to prelates for the behoof of the church, or *in puram elemosinam*; the only services prestable by the vassals were prayers, and singing of masses for the souls of the deceased, which approaches nearer to blanch-holding than ward. The purposes of such grants having been, upon the reformation, declared superstitious, the lands mortified were annexed to the crown: but mortifications to universities, hospitals, &c. were not affected by that annexation; and lands may, at this day, be mortified to any lawful purpose, either by blanch or by feu holding.

### SECT. V. Of the casualties due to the superior.

THE right of the superior continues unimpaired, notwithstanding the feudal grant, unless in so far as the *dominium utile*, or property, is conveyed to his vassal. The superiority carries a right to the services and annual duties contained in the *reddendo* of the vassal's charter. The duty payable by the vassal is a *debitum fundi*; i. e. it is recoverable, not only by a personal action against himself, but by a real action against the lands.

2. Besides the constant fixed rights of superiority, there are others, which, because they depend upon uncertain events, are called *casualties*.

3. The casualties proper to a ward-holding, while that tenure subsisted, were ward, recognition, and marriage, which it is now unnecessary to explain, as by the late statutes 20 and 25 Geo. II. for abolishing ward-holdings, the tenure of the lands holden ward of the crown or prince is turned into *blanch*, for payment of one penny Scots yearly, *si petatur tantum*; and the tenure of those holden of subjects, into *feu*, for payment of such yearly feu-duty in money, victual, or cattle, in place of all services, as shall be fixed by the court of session. And accordingly that court, by act of federunt, Feb. 8. 1749, laid down rules for ascertaining the extent of these feu-duties.

4. The only casualty, or rather forfeiture, proper to feu-holdings, is the loss or tinsel of the feu-right, by the neglect of payment of the feu-duty for two full years. Yet where there is no conventional irritancy in the feu-right, the vassal is allowed to purge the legal irritancy at the bar; that is, he may prevent the for-

feiture, by making payment before sentence: but where the legal irritancy is forfeited by a conventional, he is not allowed to purge, unless where he can give a good reason for the delay of payment.

5. The casualties common to all holdings are, non-entry, relief, liferent-echeat, disclamation, and purpresture. NON-ENTRY is that casualty which arises to the superior out of the rents of the feudal subject, through the heir's neglecting to renew the investiture after his ancestor's death. The superior is intitled to this casualty, not only where the heir has not obtained himself seisin, but where his retour is set aside upon nullities. The heir, from the death of the ancestor, till he be cited by the superior in a process of general declarator of non-entry, loses not only the retoured duties of his lands, (see next parag.) ; and he forfeits these, though his delay should not argue any contempt of the superior, because the casualty is considered to fall, as a condition implied in the feudal right, and not as a penalty of transgression: but, where the delay proceeds not from the heir, but from the superior, nothing is forfeited.

6. For understanding the nature of retoured duties, it must be known, that there was anciently a general valuation of all the lands in Scotland, designed both for regulating the proportions of public subsidies, and for ascertaining the quantity of non-entry and relief-duties payable to the superior; which appears, by a contract between K. R. Bruce and his subjects anno 1327, preserved in the library of the Faculty of Advocates, to have been settled at least as far back as the reign of Alexander III. This valuation became in the course of time, by the improvement of agriculture, and perhaps also by the heightening of the nominal value of our money, from the reign of Robert I. downwards to that of James III. much too low a standard for the superior's casualties: wherefore, in all services of heirs, the inquest came at last to take proof likewise of the present value of the lands contained in the brief (*quantum nunc valent*) in order to fix these casualties.

The Old and first was called the *old*, and the other the *new*, extent. Though both extents were ordained to be specified in all retours made to the chancery upon briefs of inquest; yet by the appellation of retoured duties in a question concerning casualties, the new extent is always understood. The old extent continued the rule for levying public subsidies, till a tax was imposed by new proportions, by several acts made during the usurpation. By two acts of Cromwell's parliament, held at Westminster in 1656, imposing taxations on Scotland, the rates laid upon the several counties are precisely fixed. The subsidy granted by the act of convention 1667 was levied on the several counties, nearly in the same proportions that were fixed by the usurper in 1656; and the sums to which each county was subjected were subdivided among the individual land-holders in that county, according to the valuations already settled, or that should be settled by the commissioners appointed to carry that act into execution. The rent fixed by these valuations is commonly called the *valued rent*; Valued according to which the land-tax, and most of the other rent public burdens, have been levied since that time.

7. In feu-holdings, the feu-duty is retoured as the rent, because the feu-duty is presumed to be, and truly was at first, the rent. The superior therefore of a feu-

Law of  
Scotland.

holding gets no non-entry, before citation in the general declarator; for he would have been intitled to the yearly feu-duty, though the fee had been full, *i. e.* though there had been a vassal infest in the lands. The superior of teinds gets the fifth part of the retoured duty as non-entry, because the law considers teinds to be worth a fifth part of the rent. In rights of annualrent which are holden of the granter, the annualrenter becomes his debtor's vassal; and the annualrent contained in the right is retoured to the blanch or other duty contained in the right before declarator.

8. It is because the retoured duty is the presumed rent, that the non-entry is governed by it. If therefore no retour of the lands in non-entry can be produced, nor any evidence brought of the retoured duty, the superior is intitled to the real, or at least to the valued, rent, even before citation. In lands formerly holden ward of the King, the heir, in place of the retoured duties, is subjected only to the annual payment of one *per cent.* of the valued rent.

9. The heir, after he is cited by the superior in the action of general declarator, is subjected to the full rents till his entry, because his neglect is less excusable after citation. The decree of declarator, proceeding on this action, intitles the superior to the possession, and gives him right to the rents downward from the citation. As this sort of non-entry is properly penal, our law has always restricted it to the retoured duties, if the heir had a probable excuse for not entering.

In what  
cases non-  
entry is not  
due.

10. Non-entry does not obtain in burgh-holdings, because the incorporation of inhabitants holds the whole incorporated subjects of the King; and there can be no non-entry due in lands granted to communities, because there the vassal never dies. This covers the right of particulars from non-entry: for if non-entry be excluded with regard to the whole, it cannot obtain with regard to any part. It is also excluded, as to a third of the lands, by the *terce*, during the widow's life; and as to the whole of them, by the courtesy during the life of the husband. But it is not excluded by a precept of *seisin* granted to the heir, till *seisin* be taken thereupon.

Relief.

11. RELIEF is that casualty which intitles the superior to an acknowledgment or consideration from the heir, for receiving him as vassal. It is called *relief*, because, by the entry of the heir, his fee is relieved out of the hands of the superior. It is not due in feu-holdings flowing from subjects, unless where it is expressed in the charter by a special clause for doubling the feu-duty at the entry of an heir; but, in feu-rights holden of the crown, it is due, though there should be no such clause in the charter. The superior can recover this casualty, either by a pointing of the ground, as a *debitum fundi*, or by a personal action against the heir. In blanch and feu holdings, where this casualty is expressly stipulated, a year's blanch or feu duty is due in name of *relief*, beside the current year's duty payable in name of *blanch* or *feu farm*.

Escheat.

12. ESCHIEAT (from *escheoir*, to happen or fall) is that forfeiture which falls through a person's being denounced rebel. It is either single or liferent. Single escheat, though it does not accrue to the superior, must be explained in this place, because of its coincidence with liferent.

13. After a debt is constituted, either by a formal

decree, or by registration of the ground of debt, which, to the special effect of execution, is in law accounted a decree; the creditor may obtain letters of horning, issuing from the signet, commanding messengers to charge the debtor to pay or perform his obligation, within a day certain. Where horning proceeds on a formal decree of the Session, the time indulged by law to the debtor is fifteen days; if upon a decree of the commission of teinds or admiral, it is ten; and upon the decrees of all inferior judges, fifteen days. Where it proceeds on a registered obligation, which specifies the number of days, that number must be the rule; and, if no precise number be mentioned, the charge must be given on fifteen days, which is the term of law, unless where special statute interposes; as in bills, upon which the debtor may be charged on six days.

Law of  
Scotland.  
Letters of  
horning.

14. The messenger must execute these letters (and indeed all summonses) against the debtor, either personally or at his dwelling-house; and, if he get not access to the house, he must strike six knocks at the gate, and thereafter affix to it a copy of his execution. If payment be not made within the days mentioned in the horning, the messenger, after proclaiming three o'yes at the market-cross of the head borough of the debtor's domicile, and reading the letters there, blows three blasts with a horn, by which the debtor is understood to be proclaimed rebel to the king for contempt of his authority; after which, he must affix a copy of the execution to the market-cross: This is called the publication of the diligence, or a denunciation at the horn. Where the debtor is not in Scotland, he must be charged on sixty days, and denounced at the market-cross of Edinburgh, and pier and shore of Leith.

Denun-  
tiation.

15. Denunciation, if registered within 15 days, either in the sheriff's books, or in the general register, drew after it the rebel's single escheat, *i. e.* the forfeiture of his moveables to the crown. Persons denounced rebels have not a *persona standi in judicio*; they can neither sue nor defend in any action. But this incapacity being unfavourable, is personal to the rebel, and cannot be pleaded against his assignee.

Confes-  
sion of  
guilt.

16. Persons cited to the court of judicatory may be also denounced rebels, either for appearing there with too great a number of attendants; or, if they fail to appear, they are declared fugitives from the law. Single escheat falls, without denunciation, upon sentence of death pronounced in any criminal trial: and, by special statute, upon one's being convicted of certain crimes, though not capital; as perjury, bigamy, deforcement, breach of arrestment, and usury. By the late act abolishing wardholdings, the casualties both of single and liferent escheat are discharged, when proceeding upon denunciation for civil debts; but they still continue, when they arise from criminal causes. All moveables belonging to the rebel at the time of his rebellion, (whether proceeding upon denunciation, or sentence in a criminal trial), and all that shall be afterwards acquired by him until relaxation, fall under single escheat. Bonds bearing interest, because they continue heritable *quoad fructum*, fall not under it, nor such fruits of heritable subjects as become due after the term next ensuing the rebellion, these being reserved for the liferent escheat.

Denun-  
tiation in  
criminal  
cases.

17. The king never retains the right of escheat to himself,

himself, but makes it over to a donatory, whose gift is not perfected, till, upon an action of general declarator, it be declared that the rebel's escheat has fallen to the crown by his denunciation, and that the right of it is now transferred to the pursuer by the gift in his favour. Every creditor therefore of the rebel, whose debt was contracted before rebellion, and who has used diligence before declarator, is preferable to the donatory. But the escheat cannot be affected by any debt contracted, nor by any voluntary deed of the rebel after rebellion.

18. The rebel, if he either pays the debt charged for, or suspends the diligence, may procure letters of relaxation from the horn, which, if published in the same place, and registered 15 days thereafter in the same register with the denunciation, have the effect to restore him to his former state; but they have no retrospect as to the moveables already fallen under escheat, without a special clause for that purpose.

19. The rebel, if he continues unrelaxed for year and day after rebellion, is construed to be civilly dead: and therefore, where he holds any feudal right, his superiors, as being without a vassal, are entitled, each of them, to the rents of such of the lands belonging to the rebel as hold of himself, during all the days of the rebel's natural life, by the casualty of *LIFERENT ESCHIEAT*; except where the denunciation proceeds upon treason or proper rebellion, in which case the liferent falls to the king.

20. It is that estate only, to which the rebel has a proper right of liferent in his own person, that falls under his liferent escheat.

21. Though neither the superior nor his donatory can enter into possession in consequence of this casualty, till decree of declarator; yet that decree, being truly declaratory, has a retrospect, and does not so properly confer a new right, as declare the right formerly constituted to the superior, by the civil death of his vassal. Hence, all charters or heritable bonds, though granted prior to the rebellion, and all adjudications, though led upon debts contracted before that period, are ineffectual against the liferent escheat, unless seisin be taken thereon within year and day after the grantor's rebellion.

22. Here, as in single escheat, no debt contracted after rebellion can hurt the donatory, nor any voluntary right granted after that period, though in security or satisfaction of prior debts.

23. *DISCLAMATION* is that casualty whereby a vassal forfeits his whole feu to his superior, if he disowns or disclaims him, without ground, as to any part of it. *PURFEISTURE* draws likewise a forfeiture of the whole feu after it; and is incurred by the vassal's encroaching upon any part of his superior's property, or attempting by building, inclosing, or otherwise, to make it his own. In both these feudal delinquencies, the least colour of excuse saves the vassal.

24. All grants from the crown, whether charters, gifts of casualties, or others, proceed on signatures which pass the signet. When the king resided in Scotland, all signatures were superscribed by him; but, on the accession of James VI. to the crown of England, a cachet or seal was made, having the king's name engraved on it, in pursuance of an act of the privy-council, April 4. 1603. with which all signatures were to

be afterwards sealed, that the lords of exchequer were empowered to pass; and these powers are transferred to the court of exchequer, which was established in Scotland after the union of the two kingdoms in 1707. Grants of higher consequence, as remissions of crimes, gifts proceeding upon forfeiture, and charters of *novodamus*, must have the king's sign-manual for their warrant.

25. If lands holding of the crown were to be conveyed, the charter passed, before the union of the kingdoms in 1707, by the great seal of Scotland; and now by a seal substitute in place thereof. Grants of church-dignities, during episcopacy, passed also by the great seal; and the commissions to all the principal officers of the crown, as Justice-Clerk, King's Advocate, Solicitor, &c. do so at this day. All rights which subjects may transmit by simple assignation, the king transmits by the privy-seal: as gifts of moveables, or of casualties that require no seisin. The quarter seal, otherwise called the *testimonial of the great seal*, is appended to gifts of tutory, commissions of briefs issuing from the chancery, and letters of presentation to lands holding of a subject, proceeding upon forfeiture, *ballardy*, or *ultimus hæres*.

26. Seals are to royal grants, what subscription is to rights derived from subjects, and give them authority; they serve also as a check to gifts procured (*subreptione vel obreptione*) by concealing the truth, or expressing a falsehood; for, where this appears, the gift may be stopped before passing the seals, tho' the signature should have been signed by the king. All rights passing under the great or privy seal must be registered in the registers of the great or privy seal *respectively*, before appending the seal.

# SECT. VI. Of the right which the vassal acquires by getting the feu. clxvii.

UNDER the *dominium utile* which the vassal acquires by the feudal right, is comprehended the property of *utile*. whatever is considered as part of the lands, whether of houses, woods, inclosures, &c. above ground; or of coal, limestone, minerals, &c. under ground. Mills have, by the generality of our lawyers, been deemed a separate tenement, and so not carried by a charter or disposition, without either a special clause conveying mills, or the erection of the lands into a barony. Yet it is certain, that, if a proprietor builds a mill on his own lands, it will be carried by his entail, or by a retour, without mentioning it, although the lands are not erected into a barony. If the lands disposed bestricted, or thirled to another mill, the purchaser is not allowed to build a new corn-mill on his property, even though he should offer security that it shall not hurt the thirle; which is introduced for preventing daily temptations to fraud.

2. Proprietors are prohibited to hold dove-cotes, unless their yearly rent, lying within two miles thereof, extend to ten chalders of victual. A purchaser of lands, with a dove-cote, is not obliged to pull it down, though he should not be qualified to build one; but, if it becomes ruinous, he cannot rebuild it. The right of brewing, though not expressed in the grant, is implied in the nature of property; as are also the rights of fishing, fowling, and hunting, in so far as they are not restrained by statute.

Law of  
Scotland.  
Regalia.

3. There are certain rights naturally consequent on property, which are deemed to be preferred by the crown as *regalia*; unless they be specially conveyed. Gold and silver mines are of this sort: the first universally; and the other, where three half-pennies of silver can be extracted from the pound of lead, by act 1424, (three half-pennies at that time was equal to about two shillings five pennies of our present Scots money.) These were by our ancient law annexed to the crown; but they are now dissolved from it; and every proprietor is intitled to a grant of the mines within his own lands, with the burden of delivering to the crown a tenth of what shall be brought up.

4. Salmon-fishing is likewise a right understood to be reserved by the crown, if it be not expressly granted; but 40 years possession thereof, where the lands are either erected into a barony, or granted with the general clause of fishings, establishes the full right of the salmon-fishing in the vassal. A charter of lands, within which any of the king's forests lie, does not carry the property of such forest to the vassal.

5. All the subjects which were by the Roman law accounted *res publica*, as rivers, high-ways, ports, &c. are, since the introduction of feus, held to be *inter regalia*, or *in patrimonio principis*; and hence encroachment upon a highway is laid to infer purpresture. No person has the right of a free port without a special grant, which implies a power in the grantee to levy anchorage and thore dues, and an obligation upon him to uphold the port in good condition. In this class of things, our forefathers reckoned fortalices, or small places of strength, originally built for the defence of the country, either against foreign invasions, or civil commotions; but these now pass with the lands in every charter.

Pertinents.

6. The vassal acquires right by his grant, not only to the lands specially contained in the charter, but to those that have been possessed 40 years as pertinent thereof. But, 1. If the lands in the grant are marked out by special limits, the vassal is circumscribed by the tenor of his own right, which excludes every subject without these limits from being pertinent of the lands.

2. A right possessed under an express investment is preferable, *ceteris paribus*, to one possessed only as pertinent.

3. Where neither party is *infest per expressum*, the mutual promiscuous possession by both, of a subject as pertinent, resolves into a community of the subject possessed: but if one of the parties has exercised all the acts of property of which the subject was capable, while the possession of the other was confined to pasturage only, or to casting seal and divot, the first is to be deemed sole proprietor, and the other to have merely a right of servitude.

Privileges  
of barony.

7. As barony is a *nomen universitatis*, and unites the several parts contained in it into one individual right, the general conveyance of a barony carries with it all the different tenements of which it consists, tho' they should not be specially enumerated; (and this holds, even without creation into a barony, in lands that have been united under a special name.) Hence, likewise, the possession by the vassal of the smallest part of the barony-lands preserves to him the right of the whole.

8. The vassal is intitled, in consequence of his property, to levy the rents of his own lands, and to reco-

ver them from his tenants by an action for rent before his own court; and from all other possessors and intruders, by an action of mails and duties before the sheriff. He can also remove from his lands, tenants Tack or who have no leases; and he can grant tacks or leases to others. A tack is a contract of location, whereby the use of land, or any other immovable subject, is set to the lessee or tackman for a certain yearly rent, either in money, the fruits of the ground, or services. It ought to be reduced into writings, as it is a right concerning lands: tacks therefore, that are given verbally, to endure for a term of years, are good against neither party for more than one year. An obligation to grant a tack is as effectual against the grantor, as a formal tack. A liferenter, having a temporary property in the fruits, may grant tacks to endure for the term of his own life-tenet.

9. The tackman's right is limited to the fruits which spring up annually from the subject set, either naturally, or by the industry of the tackman; he is not therefore intitled to any of the growing timber above ground, and far less to the minerals, coal, clay, &c. under ground, the use of which consumes the substance. Tacks are, like other contracts, personal rights in their own nature, and consequently inefficual against singular successors in the lands; but, for the encouragement of agriculture, they were, by act 1449, declared effectual to the tackman for the full time of their endurance, into whose hands soever the lands might come.

10. To give a written tack the benefit of this statute, it must mention the special tack-duty payable to the proprietor, which though small, if it be not clausory, secures the tackman; and it must be followed by possession, which supplies the want of a seisin. If a tack does not express the term of entry, the entry will commence at the next term after its date, agreeable to the rule, *Quid pure debetur, presentis die debetur*. If it does not mention the *isth*, i. e. the term at which it is to determine, it is good for one year only; but, if the intention of parties to continue it for more than one year, should appear from any clause in the tack, it is sustained for two years as the *minimum*. Tacks granted to perpetuity, or with an indefinite *isth*, have not the benefit of the statute. Tacks of houses within borough do not fall within this act.

11. Tacks necessarily imply a *delectus persone*, a Tacks choice by the fetter of a proper person for his tenant. *stricti* Hence the conveyance of a tack, which is not granted to assignees, is inefficual without the landlord's consent. A right of tack, though it be heritable, falls under the *jus mariti*, because it cannot be separated from the labouring cattle and implements of tillage, which are moveable subjects. A tack, therefore, granted to a single woman, without the liberty of assigning, falls by her marriage; because the marriage, which is a legal conveyance thereof to the husband, cannot be annulled. This implied exclusion of assignees is however limited to voluntary, and does not extend to necessary assignments; as an adjudication of a tack by the tackman's creditor: but a tack, expressly excluding assignees, cannot be carried even by adjudication. But tackmen may sublet, unless subtenants are expressly excluded; and liferent tacks, because they import a higher degree of right in the tackman than tacks for

Law of  
Scotlandtacit relo-  
cation.tacit  
tacks.

arising.

Law of  
Scotland.Actions of  
removing.Violent  
profits.Effect of  
warning not  
insisted in.

a definite term, may be assigned, unless assignees be specially excluded.

12. If neither the fetter nor tackman shall properly discover their intention to have the tack dissolved at the term fixed for its expiration, they are understood, or presumed, to have entered into a new tack upon the same terms with the former, which is called *tacit relocation*; and continues till the landlord warns the tenant to remove, or the tenant renounces his tack to the landlord: this obtains also in the case of moveable tenants, who possess from year to year without written tacks.

13. In tacks of land, the fetter is commonly bound to put all the houses and office-houses, necessary for the farm, in good condition at the tenant's entry; and the tenant must keep them and leave them so at his removal. But, in tacks of houses, the fetter must not only deliver to the tenant the subject set, in tenantable repair at his entry, but uphold it in that repair during the whole years of the tack.

14. If the inclemency of the weather, inundation, or calamity of war, should have brought upon the crop an extraordinary damage, (*plus quam tolerabile*), the landlord had, by the Roman law, no claim for any part of the tack-duty: if the damage was more moderate, he might exact the full rent. It is nowhere defined, what degree of sterility or devastation makes a loss not to be borne; but the general rule of the Roman law seems to be made ours. Tenants are obliged to pay no public burdens to which they are not expressly bound by their tack, except mill-services.

15. Tacks may be evacuated during their currency, (1.) In the same manner as feu-rights, by the tackman's running in arrear of his tack-duty for two years together. This irritancy may be prevented by the tenant's making payment at the bar before sentence. (2.) Where the tenant either runs in arrear of one year's rent, or leaves his farm uncultivated at the usual season; in which case he may be ordained to give security for the arrears, and for the rent of the five following crops, if the tack shall subsist so long; otherwise, to remove, as if the tack were at an end. (3.) Tacks may be evacuated at any time, by the mutual consent of parties.

16. The landlord, when he intends to remove a tenant whose tack is expiring, or who possesses without a tack, must, upon a precept signed by himself, warn the tenant forty days preceding the term of Whitfunday, or at immediately preceding the ish, personally, or at his dwelling-house, to remove at that term, with his family and effects. This precept must be also executed on the ground of the lands, and thereafter read in the parish-church where the lands lie, after the morning service, and affixed to the most patent door thereof. Whitfunday, though it be a moveable feast, is, in questions of removing, fixed to the 15th of May. In warnings from tenements within borough, it is sufficient that the tenant be warned forty days before the ish of the tack, whether it be Whitfunday or Martinmas; and in these the ceremony of chalking the door is sustained as warning, when proceeding upon a verbal order from the proprietor.

17. This process of warning was precisely necessary for founding an action of removing against tenants, till act of federunt of the court of session, Dec. 14. 1756,

which leaves it in the option of the proprietor, either to use the former method, or to bring his action of removing before the judge-ordinary; which, if it be called forty days before the said term of Whitfunday, shall be held as equal to a warning. Where the tenant is bound, by an express clause of his tack, to remove at the ish without warning, such obligation is, by the said act, declared to be a sufficient warrant for letters of horning, upon which, if the landlord charge his tenant forty days before the said Whitfunday, the judge is authorised to eject him within six days after the term of removing expressed in the tack.

18. Actions of removing might, even before this act of federunt, have been pursued without any previous warning, (1.) Against vicious possessors, *i. e.* persons who had seized the possession by force, or who, without any legal title, had intruded into it, after the last possessor had given it up. (2.) Against possessors who had a naked tolerance. (3.) Against tenants who had run in arrear of rent, during the currency of their tacks. (4.) Against such as had sold their lands, and yet continued to possess after the term of the purchaser's entry. Upon the same ground, warning was not required, in removing against possessors of liferented lands, after the death of the liferenter who died in the natural possession; but if he possessed by tenants, these tenants could not be disturbed in their possessions till the next Whitfunday, that they might have time to look out for other farms; but they might be compelled to remove at that term, by an action of removing, without warning.

19. A landlord's title in a removing, let it be ever so lame, cannot be brought under question by a tenant whose tack flows immediately from him; but, if he is to insist against tenants not his own, his right must be perfected by infestment, unless it be such as requires no infestment; as terce, &c.

20. The defender, in a removing, must, before offering any defence which is not instantly verified, give security to pay to the fetter the *violent profits*, if they should be awarded against him. These are so called, because the law considers the tenant's possession after the warning as violent. They are estimated, in tenements within borough, to double the rent; and in lands, to the highest profits the pursuer could have made of them, by possessing them either by a tenant, or by himself.

21. If the action of removing shall be passed from, or if the landlord shall, after using warning, accept of rent from the tenant, for any term subsequent to that of the removal, he is presumed to have changed his mind, and tacit relocation takes place. All actions of removing against the principal or original tackman, and decrees thereupon, if the order be used, which is set forth *supra*, (17.) are, by the act of federunt 1756, declared to be effectual against the assignees to the tack, or subtenants.

22. The landlord has, in security of his tack-duty, Hypothec over and above the tenant's personal obligation, a tacit pledge or hypothec, not only in the fruits, but in the cattle pasturing on the ground. The corn, and other fruits, are hypothecated for the rent of that year whereof they are the crop; for which they remain affected, though the landlord should not use his right for years together.

Law of  
Scotland.Law of  
Scotland.

23. The whole cattle on the ground, considered as a quantity, are hypothecated for a year's rent, one after another successively. The landlord may apply this hypothec for payment of the past year's rent, at any time within three months from the last conventional term of payment, after which it ceases for that year. As the tenant may increase the subject of this hypothec, by purchasing oxen, sheep, &c. so he can impair it, by selling part of his stock; but if the landlord suspects the tenant's management, he may, by sequestration or pointing, make his right, which was before general upon the whole flock, special upon every individual. A superior has also a hypothec for his feu-duty, of the same kind with that just explained.

24. In tacks of houses, breweries, shops, and other tenements, which have no natural fruits, the furniture and other goods brought into the subject set are hypothecated to the landlord for one year's rent. But the tenant may by sale impair this hypothec, as he might that of cattle in rural tenements; and indeed, in the particular case of a shop, the tenant rents it for no other purpose than as a place of sale.

cixviii. SECT. VII. *Of the transmission of rights, by confirmation and resignation.*

Transmis-  
sion of feu-  
dal rights.

A VASSAL may transmit his feu either to universal successors, as heirs; or to singular successors, *i. e.* those who acquire by gift, purchase, or other singular title. This last sort of transmission is either voluntary, by disposition; or necessary, by adjudication.

2. By the first feudal rules, no superior could be compelled to receive any vassal in the lands, other than the heir expressed in the investiture; for the superior alone had the power of ascertaining to what order of heirs the fee granted by himself was to descend. But this right of refusal in the superior did not take place, (1.) In the case of creditors appraisers or adjudgers, whom superiors were obliged to receive upon payment of a year's rent. (2.) In the case of purchasers of bankrupt estates, who were put on the same footing with adjudgers. The crown refuses no voluntary dispositive, on his paying a composition to the exchequer of a sixth part of the valued rent. Now superiors are directed to enter all singular successors (except incorporations) who shall have got from the vassal a disposition, containing procuratory of resignation; they always receiving the fees or casualties that law entitles them to on a vassal's entry, *i. e.* a year's rent.

Base rights.

3. Base rights, *i. e.* dispositions to be holden of the disposer, are transmissions only of the property, the superiority remaining as formerly. As this kind of right might, before establishing the registers, have been kept quite concealed from all but the grantor and receiver, a public right was preferable to it, unless clothed with possession: but as this distinction was no longer necessary after the establishment of the records, all investments are declared preferable, according to the dates of their several registrations; without respect to the former distinction of base and public, or of being clothed and not clothed with possession.

Public  
rights.

4. Public rights, *i. e.* dispositions to be holden of the grantor's superior, may be perfected either by confirmation or resignation; and therefore, they generally contain both precept of seisin and procuratory of resignation. When the receiver is to complete his right in

the first way, he takes seisin upon the precept: but such seisin is ineffectual without the superior's confirmation; for the dispositive cannot be deemed a vassal, till the superior receive him as such, or confirm the holding. By the usual style in the transmission of lands, the disposition contains an obligation and precept of investiture, both *a me* and *de me*, in the option of the dispositive; upon which, if seisin is taken indefinitely, it is construed in favour of the dispositive to be a base investiture, because a public right is null without confirmation: but, if the receiver shall afterwards obtain the superior's confirmation, it is considered as if it had been from the beginning a public right.

5. Where two several public rights of the same subject are confirmed by the superior, their preference is governed by the dates of the confirmations, not of the investments confirmed; because it is the confirmation which completes a public right.

Preference  
in confir-  
mation.

6. Though a public right becomes, by the superior's confirmation, valid from its date; yet if any mid impediment intervene betwixt that period and the confirmation, to hinder the two from being conjoined, *e. g.* if the grantor of a public right should afterwards grant a base right to another, upon which seisin is taken before the superior's confirmation of the first, the confirmation will have effect only from its own date; and consequently the base right first completed, will carry the property of the lands preferable to the public one.

7. Resignation is that form of law, by which a vassal surrenders his feu to his superior; and it is either *ad perpetuam remanentiam*, or *in favorem*. In resignations *ad remanentiam*, where the feu is resigned, to the effect that it may remain with the superior, the superior, who before had the superiority, acquires, by the resignation, the property also of the lands resigned: and as his investiture in the lands still subsisted, notwithstanding the right by which he had given his vassal the property; therefore, upon the vassal's resignation, the superior's right of property revives, and is consolidated with the superiority, without the necessity of a new investiture; but the instrument of resignation must be recorded.

Resigna-  
tions.

8. Resignations *in favorem* are made, not with an intention that the property resigned should remain with the superior, but that it should be again given by him, in favour either of the resigner himself, or of a third party; consequently the fee remains in the resigner, till the person in whose favour resignation is made gets his right from the superior perfected by seisin. And because resignations *in favorem* are but incomplete personal deeds, our law has made no provision for recording them. Hence, the first seisin on a second resignation is preferable to the last seisin upon the first resignation; but the superior, accepting a second resignation, whereupon a prior seisin may be taken in prejudice of the first resignatory, is liable in damages.

9. By our former decisions, one who was vested with a personal right of lands, *i. e.* a right not completed by seisin, effectually divested himself by disposing it to another; after which, no right remained in the disposer, which could be carried by a second disposition, because a personal right is no more than a *jus obligatio- nis*, which may be transferred by any deed sufficiently expressing the will of the grantor. But this doctrine, at the same time that it rendered the security of the records extremely uncertain, was not truly applicable to such

Such

Law of Scotland.

Law of Scotland.

such rights as required feisin to complete them; and therefore it now obtains, that the grantor even of a personal right of lands, is not so divested by conveying the right to one person, but that he may effectually make it over afterwards to another; and the preference between the two does not depend on the dates of the dispositions, but on the priority of the feisins following upon them.

cut out of it by prescription.

5. If the reverfer would redeem his lands, he must use an order of redemption against the wadsetter: the first step of which is premonition (or notice given under form of instrument) to the wadsetter, to appear at the time and place appointed by the reverfer, then and there to receive payment of his debt, and thereupon to renounce his right of wadset. In the voluntary redemption of a right of wadset holden base, a renunciation duly registered re-establishes the reverfer in the full right of the lands. Where the wadset was granted to be holden of the grantor's superior, the superior must receive the reverfer, on payment of a year's rent, if he produce a disposition from the wadsetter, containing procuratory of resignation. If, at executing the wadset, the superior has granted letters of regrefs, *i. e.* an obligation again to enter the reverfer upon redemption of the lands, he will be obliged to receive him, without payment of the year's rent. But letters of regrefs will not have this effect against singular successors in the superiority, if they are not registered in the register of reversions. All wadsets that remain personal rights, are extinguished by simple discharges, though they should not be recorded.

SECT. VIII. Of Redeemable Rights.

AN heritable right is said to be redeemable, when it contains a right of reversion, or return, in favour of the person from whom the right flows. Reversions are either legal, which arise from the law itself, as in adjudications, which law declares to be redeemable within a certain term after their date; or conventional, which are constituted by the agreement of parties, as in wadsets, rights of annualrent, and rights in security. A wadset (from wad or pledge) is a right, by which lands, or other heritable subjects, are impignored by the proprietor to his creditor, in security of his debt; and, like other heritable rights, is perfected by feisin. The debtor, who grants the wadset, and has the right of reversion, is called the reverfer; and the creditor, receiver of the wadset, is called the wadsetter.

2. Wadsets, by the present practice, are commonly made out in the form of mutual contracts, in which one party sells the land, and the other grants the right of reversion. When the right of reversion is thus incorporated in the body of the wadset, it is effectual without registration; because the singular successor in the wadset is, in that case, sufficiently certified of the reversion, though it be not registered, by looking into his own right, which bears it *in gremio*. But where the right of reversion is granted in a separate writing, it is ineffectual against the singular successor of the wadsetter, unless it be registered in the register of feisins within 60 days after the date of the feisin upon the wadset.

3. Rights of reversion are generally esteemed *stricti juris*; yet they go to heirs, though heirs should not be mentioned, unless there be some clause in the right, discovering the intention of parties, that the reversion should be personal to the reverfer himself. In like manner, though the right should not express a power to redeem from the wadsetter's heir, as well as from himself, redemption will be competent against the heir. All our lawyers have affirmed, that reversions cannot be assigned, unless they are taken to assignees; but from the favour of legal diligence, they may be adjudged.

4. Reversions commonly leave the reverfer at liberty to redeem the lands *quandocunque*, without restriction in point of time; but a clause is adjoined to some reversions, that if the debt be not paid against a determinate day, the right of reversion shall be irritated, and the lands shall become the irredeemable property of the wadsetter. Nevertheless, the irritancy being penal, as in wadsets, the sum lent falls always short of the value of the lands, and the right of redemption is by indulgence continued to the reverfer, even after the term has expired, while the irritancy is not declared. But the reverfer, if he does not take the benefit of this indulgence within 40 years after the lapse of the term, is

6. If the wadsetter either does not appear at the time and place appointed, or refuses the redemption-money, the reverfer must consign it under form of instrument, in the hands of the person thereto appointed in the right of reversion; or, if no person be named, in the hands of the clerk to the bills, a clerk of session, or any responal person. An instrument of consignation, with the consignatory's receipt of the money consigned, completes the order of redemption, stops the farther currency of interest against the reverfer, and founds him in an action for declaring the order to be formal, and the lands to be redeemed in consequence of it.

7. After decree of declarator is obtained, by which the lands are declared to return to the debtor, the consigned money, which comes in place of the lands, becomes the wadsetter's, who therefore can charge the consignatory upon letters of horning to deliver it up to him; but, because the reverfer may, at any time before decree, pass from his order, as one may do from any other step of diligence, the consigned sums continue to belong to the reverfer, and the wadsetter's interest in the wadset continues heritable till that period.

8. If the wadsetter chuses to have his money rather than the lands, he must require from the reverfer, under form of instrument, the sums due by the wadset, in terms of the right. The wadset sums continue heritable, notwithstanding requisition, which may be passed from by the wadsetter even after the reverfer has consigned the redemption-money in consequence thereof.

9. Wadsets are either proper or improper. A proper wadset is that whereby it is agreed, that the use of the land shall go for the use of the money; so that the wadsetter takes his hazard of the rents, and enjoys them without accounting, in satisfaction, or *in solutum* of his interest.

Wadsets.

10. In an improper wadset, the reverfer, if the rent should fall short of the interest, is taken bound to make up the deficiency; if it amounts to more, the wadsetter is obliged to impute the excrecence towards extinction

Law of Scotland

Law of Scotland.

of the capital: And, as soon as the whole sum, principal and interest, are extinguished by the wadsetter's possession, he may be compelled to renounce, or divest himself in favour of the reverfer.

11. If the wadsetter be intitled by his right to enjoy the rents without accounting, and if at the same time the reverfer be subjected to the hazard of their deficiency, such contract is justly declared usurious: and also in all proper wadsets wherein any unreasonable advantage has been taken of the debtor, the wadsetter must, during the not requisition of the sum lent, either quit his possession to the debtor, upon his giving security to pay the interest, or subject himself to account for the surplus-rents, as in improper wadsets.

Rights of annualrent.

12. Infeftments of annualrent, the nature of which has been explained, are also redeemable rights. A right of annualrent does not carry the property of the lands; but it creates a real *nexus* or burden upon the property, for payment of the interest or annualrent contained in the right; and consequently the bygone interests due upon it are *debita fundi*. The annualrenter may therefore either infest in a real action for obtaining letters of poiding the ground, or sue the tenant in a personal action towards the payment of his past interest: and in a competition for those rents, the annualrenter's preference will not depend on his having used a poiding of the ground, for his right was completed by the feisin; and the power of poiding the ground, arising from that antecedent right, is *mere facultatis*, and need not be exercised, if payment can be otherwise got. As it is only the interest of the sum lent which is a burden upon the lands, the annualrenter, if he wants his principal sum, cannot recover it either by poiding or by a personal action against the debtor's tenants; but must demand it from the debtor himself, on his personal obligation in the bond, either by requisition, or by a charge upon letters of horning, according as the right is drawn.

13. Rights of annualrent, being servitudes upon the property, and consequently consistent with the right of property in the debtor, may be extinguished without resignation.

Rights of security.

14. Infeftments in security are another kind of redeemable rights (now frequently used in place of rights of annualrent, by which the receivers are infest in the lands themselves, and not simply in an annualrent forth of them, for security of the principal sum, interest, and penalty, contained in the rights. If an infeftment in security be granted to a creditor, he may thereupon enter into the immediate possession of the lands or annualrent for his payment. They are extinguished as rights of annualrent.

15. All rights of annualrent, rights in security, and generally whatever constitutes a real burden on the fee, may be the ground of an adjudication, which is preferable to all adjudications, or other diligences, intervening between the date of the right and of the adjudication deduced on it; not only for the principal sum contained in the right, but also for the whole past interest contained in the adjudication. This preference arises from the nature of real debts, or *debita fundi*: but in order to obtain it for the interest of the interest accumulated in the adjudication, such adjudication must proceed on a process of poiding the ground.

## SECT. IX. Of Servitudes.

SERVITUDE is a burden affecting lands, or other heritable subjects, whereby the proprietor is either restrained from the full use of what is his own, or is obliged to suffer another to do something upon it. Servitudes are either natural, legal, or conventional. Nature itself may be said to constitute a servitude upon inferior tenements, whereby they must receive the water that falls from those that stand on higher ground. Legal services are established by statute or custom, from considerations of public policy; among which may be numbered the restraints laid upon the proprietors of tenements within the city of Edinburgh. There is as great a variety of conventional servitudes, as there are ways by which the exercise of property may be restrained by paction in favour of another.

clxx. Different kinds of servitude.

2. Conventional servitudes are constituted, either by grant, where the will of the party burdened is expressed in writing; or by prescription, where his consent is presumed from his acquiescence in the burden for 40 years. A servitude constituted by writing, or grant, is not effectual against the grantor's singular successors, unless the grantee has been in the use or exercise of his right: but they are valid against the grantor and his heirs, even without use. In servitudes that may be acquired by prescription, 40 years exercise of the right is sufficient, without any title in writing, other than a character and feisin of the lands to which the servitude is claimed to be due.

3. Servitudes constituted by grant are not effectual, in a question with the superior of the tenement burdened with the servitude, unless his consent be admitted; for a superior cannot be hurt by his vassal's deed: but where the servitude is acquired by prescription, the consent of the superior, whose right afforded him a good title to interrupt, is implied. A servitude by grant, though followed only by a partial possession, must be governed, as to its extent, by the tenor of the grant; but a servitude by prescription is limited by the measure or degree of the use had by him who prescribes: agreeably to the maxim, *tantum prescriptum quantum possessum*.

4. Servitudes are either predial or personal. Predial servitudes are burdens imposed upon one tenement, in favour of another tenement. That to which the servitude is due is called the *dominant*, and that which owes it is called the *servient tenement*. No person can have right to a predial servitude, if he is not proprietor of some dominant tenement that may have benefit by it; for that right is annexed to a tenement, and so cannot pass from one person to another, unless some tenement goes along with it.

Predial servitudes.

5. Predial servitudes are divided into *rural* servitudes, or of lands; and *urban* servitudes, or of houses. The rural servitudes of the Romans were *iter*, *actus*, *via*, *aqueductus*, *aqueductus*, and *jus pascendi pecoris*. Similar servitudes may be constituted with us, of a foot-road, horse-road, cart-road, dams, and aqueducts, watering of cattle, and pasturage. The right of a highway is not a servitude constituted in favour of a particular tenement, but is a right common to all travellers. The care of high-ways, bridges, and ferries, is committed to the sheriffs, justices of peace, and commissioners of supply in each shire.

thirlage.

6. Common pasturage, or the right of feeding one's cattle upon the property of another, is sometimes constituted by a general clause of pasturage in a charter or disposition, without mentioning the lands burdened; in which case, the right comprehends whatever had been formerly appropriated to the lands disposed out of the granter's own property, and likewise all pasturage due to them out of other lands. When a right of pasturage is given to several neighbouring proprietors, on a moor or common belonging to the granter, indefinite as to the number of cattle to be pastured, the extent of their several rights is to be proportioned according to the number that each of them can fodder in winter upon his own dominant tenement.

7. The chief servitudes of honks among the Romans were those of support, viz. *tigni immittendi*, and *eneris ferendi*. The first was the right of fixing in our neighbour's wall a joist or beam from our house: the second was that of resting the weight of one's house upon his neighbour's wall.

8. With us, where different floors or stories of the same house belong to different persons, as is frequent in the city of Edinburgh, the property of the house cannot be said to be entirely divided; the roof remains a common roof to the whole, and the area on which the house stands supports the whole; so that there is a communication of property, in consequence of which the proprietor of the ground-floor must, without the constitution of any servitude, uphold it for the support of the upper, and the owner of the highest story must uphold that as a cover to the lower. When the highest floor is divided into garrets among the several proprietors, each proprietor is obliged, according to this rule, to uphold that part of the roof which covers his own garret.

9. No proprietor can build, so as to throw the rain-water falling from his own house, immediately upon his neighbour's ground, without a special servitude, which is called *stillicide*; but, if it falls within his own property, though at the smallest distance from the march, the owner of the inferior tenement must receive it.

10. The servitudes *altius non tollendi*, et *non officiendi luminibus vel prospectui*, restrain proprietors from raising their houses beyond a certain height, or from making any building whatsoever that may hurt the light or prospect of the dominant tenement. These servitudes cannot be constituted by prescription alone: for, though a proprietor should have his house ever so low, or should not have built at all upon his grounds for 40 years together, he is presumed to have done so for his own convenience or profit; and therefore cannot be barred from afterwards building a house on his property, or raising it to what height he pleases, unless he be tied down by his own consent.

11. We have two predial servitudes to which the Romans were strangers, viz. that of fewel or feal and divot, and of thirlage. The first is a right, by which the owner of the dominant tenement may turn up peats, turfs, feals, or divots, from the ground of the servient, and carry them off either for fewel, or thatch, or the other uses of his own tenement.

12. THIRLAGE is that servitude, by which lands are afflicted, or thirled, to a particular mill; and the possessors bound to grind their grain there, for payment

of certain multure and sequels as the agreed price of grinding. In this servitude, the mill is the dominant tenement, and the lands afflicted (which are called also the *thirl* or *fucken*) the servient. Multure is the quantity of grain or meal payable to the proprietor of the mill, or to the multuree his tackman. The sequels are the small quantities given to the servants, under the name of *knave'ship*, *bannock*, and *lock* or *gouspen*. The quantities paid to the mill by the lands not afflicted, are generally proportioned to the value of the labour, and are called *out-town* or *out-fucken multure*; but those paid by the thirl are ordinarily higher, and are called *in-town* or *in-fucken multure*.

13. Thirlage may be constituted by a land-holder, when, in the disposition of certain lands, he afflicts them to his own mill; or when, in the disposition of a mill, he afflicts his own lands to the mill disposed; or when, in letting his lands, he makes it a condition in the tacks. The grant of a mill with the general clause of multure, without specifying the lands afflicted, conveys the thirlage of all the lands formerly afflicted to that mill, whether they were the property of the granter, or of a third party.

14. A less formal constitution serves to afflict barony-lands to the mill of the barony, than is necessary in any other thirlage; which perhaps proceeds from the effects of the union betwixt the two. Hence, if a baron makes over the mill of a barony, *cum multuris*, or *cum afflictis multuris*, it infers an affliction of the barony lands to the mill conveyed, even of such as had been before sold to another for a certain duty *pro omni alio onere*. But if, prior to the baron's conveyance of his mill *cum multuris*, he had sold any part of the barony-lands to another *cum multuris*, the first purchaser's lands are not afflicted by the posterior grant; for a right of lands with the multure, implies a freedom of these lands from thirlage.

15. Thirlage is either, 1. Of grindable corns; or, 2. Of all growing corns; or, 3. Of the *investa et illata*, i. e. of all the grain brought within the thirl, though of another growth. Where the thirlage is of grindable grain, it is in practice restricted to the corns which the tenants have occasion to grind, either for the support of their families, or for other uses; the surplus may be carried out of the thirl unmanufactured, without being liable in multure. Where it is of the *grana crescentia*, the whole grain growing upon the thirl is afflicted, with the exceptions, 1. Of seed and horse-corn, which are destined to uses inconsistent with grinding; and, 2. Of the farm-duties due to the landlord, if they are delivered in grain not grinded. But, if the rent be payable in meal, flour, or malt, the grain of which these are made must be manufactured in the dominant mill.

16. The thirlage of *investa et illata* is seldom constituted but against the inhabitants of a borough or village, that they shall grind all the unmanufactured grain they import thither at the dominant mill. Multure, therefore, cannot be exacted in a thirlage of *investa et illata*, for flour or oat-meal brought into the servient tenement, unless the importer had bought it in grain, and grinded it at another mill. The same grain that owes multure, as *granum crescent*, to the mill in whose thirl it grew, if it shall be afterwards brought within a borough where the *investa et illata* are thirled, must pay

a second culture to the proprietor of that dominant tenement; but, where the right of these two thirlages is in the same proprietor, he cannot exact both. Where lands are thirled in general terms, without expressing the particular nature of the servitude, the lightest thirlage is presumed, from the favour of liberty; but in the strictness of a borough or village, where there is no growing grain which can be the subject of thirlage, the strictness of *invecsta et illata* must be necessarily understood.

17. Thirlage, in the general case, cannot be established by prescription alone, for *ius que sunt mere facultatis non prescribitur*; but where one has paid for 40 years together the heavy infucken multures, the slightest title in writing will subject his lands. Thirlage may be, contrary to the common rule, constituted by prescription alone, 1. Where one pays to a mill a certain sum, or quantity of grain yearly, in name of culture, whether he grinds at it or not, (called *dry multure*.) 2. In mills of the king's property; which is constituted *jure coronæ*, without titles in writing; and, where he derives right from another, his titles are more liable to be lost. This is extended in practice to mills belonging to church-lands, where 30 years possession is deemed equivalent to a title in writing, from a presumption that their rights were destroyed at the reformation. Though thirlage itself cannot be constituted by mere possession, the proportion of culture payable to the dominant tenement may be so fixed.

18. The possessors of the lands affected, are bound to uphold the mill, repair the dam-dykes and aqueducts, and bring home the millstones. These services, though not expressed in the constitution, are implied.

servitudes  
are strict  
jura.

19. Servitudes, being restraints upon property, are *stricti juris*: they are not therefore presumed, if the acts upon which they are claimed can be explained consistently with freedom; and, when servitudes are constituted, they ought to be used in the way least burdensome to the servient tenement. Hence, one who has a servitude of peats upon his neighbour's moss, is not at liberty to extend it for the use of any manufacture which may require an extraordinary expence of fuel; but must confine it to the natural uses of the dominant tenement.

20. Servitudes are extinguished, (1.) *Confusione*, when the person comes to be proprietor of the dominant and servient tenements; for *res sua nemini servit*, and the use the proprietor thereafter makes of the servient tenement is not *jure servitutis*, but is an act of property. (2.) By the perishing either of the dominant or servient tenement. (3.) Servitudes are lost *non utendo*, by the dominant tenement neglecting to use the right for 40 years; which is considered as a dereliction of it, though he who has the servient tenement should have made no interruption by doing acts contrary to the servitude.

liferent.

21. Personal servitudes are those by which the property of a subject is burdened, in favour, not of a tenement, but of a person. The only personal servitude known in our law, is usufruct or liferent; which is a right to use and enjoy a thing during life, the substance of it being preserved. A liferent cannot therefore be constituted upon things which perish in the use; and though it may upon subjects which gradual-

ly wear out by time, as household furniture, &c. yet, with us, it is generally applied to heritable subjects. He whose property is burdened, is usually called the *fiar*.

Liferents.

22. Liferents are divided into conventional and legal. Conventional liferents are either simple, or by reservation. A simple liferent, or by a separate constitution, is that which is granted by the proprietor in favour of another: And this sort, contrary to the nature of predial servitudes, requires seisin in order to affect singular successors; for a liferent of lands is, in strict speech, not a servitude, but a right resembling property which constitutes the liferenter vassal for life; and singular successors have no way of discovering a liferent-right, which perhaps is not yet commenced, but by the records; whereas, in predial servitudes the constant use of the dominant tenement makes them public. The proper right of liferent is intransmissible, *offibus usufructuarii inheret*: When the profits of the liferented subject are transmitted to another, the right becomes merely personal: for it intitles the assignee to the rent, not during his own life, but his cedent's; and is therefore carried by simple assignation, without seisin.

23. A liferent by reservation, is that which a proprietor reserves to himself in the same writing by which he conveys the fee to another. It requires no seisin; for the grantor's former seisin, which virtually included the liferent, still subsists as to the liferent which is expressly reserved. In conjunct indentments taken to husband and wife, the wife's right of conjunct fee resolves, in the general case, into a liferent.

Terce.

24. Liferents by law, are the terce and the courtsey. The terce (*tertia*) is a liferent competent by law to widows, who have not accepted of special provisions, in the third of the heritable subjects in which their husbands died seint; and takes place only where the marriage has subsisted for year and day, or where a child has been born alive of it.

25. The terce is not limited to lands, but extends to tenants, and to servitudes and other burdens affecting lands; thus, the widow is intitled, in the right of her terce, to a liferent of the third of the sums secured, either by rights of annualrent, or by rights in security. In improper wadsets, the terce is a third of the sum lent: In those that are proper, it is a third of the wadset lands; or, in case of redemption, a third of the redemption money. Neither rights of reversion, superiority, nor patronage, fall under the terce; for none of these have fixed profits, and so are not proper subjects for the widow's subsistence; nor tacks, because they are not feudal rights. Burgage-tenements are also excluded from it, the reason of which is not so obvious. Since the husband's seisin is both the measure and security of the terce, such debts or diligences alone, as exclude the husband's seisin, can prevail over it.

26. Where a terce is due out of lands burdened with a prior terce still subsisting, the second terce has only right to a third of the two thirds that remain unaffected by the first terce. But upon the death of the first widow, whereby the lands are disburdened of her terce, the lesser terce becomes enlarged, as if the first had never existed. A widow, who has accepted of a special provision from her husband, is thereby excluded from the terce, unless such provision shall contain a clause that she shall have right to both.

27. The widow has no title of possession, and so cannot receive the rents in virtue of her *terce*, till she be served to it; and in order to this, she must obtain a brief out of the chancery, directed to the Sheriff, who calls an inquest, to take proof that she was wife to the deceased, and that the deceased died in feif in the subjects contained in the brief. The service or sentence of the jury, finding these points proved, does, without the necessity of a return to the chancery, intitle the wife to enter into the possession; but she can only possess with the heir *pro indiviso*, and so cannot remove tenants, till the Sheriff kens her to her *terce*, or divides the lands between her and the heir. In this division, after determining by lot or kaval, whether to begin by the sun or the shade, *i. e.* by the east or the west, the Sheriff sets off the two first acres for the heir, and the third for the widow. Sometimes the division is executed, by giving one entire farm to the widow, and two of equal value to the heir. The widow's right is not properly constituted by this service; it was constituted before by the husband's feifin, and fixed by his death; the service only declares it, and so intitles her to the third part of the rents *retro* to her husband's death, preferable to any rights that may have affected the lands in the intermediate period between that and her own service. The relic, if she was reputed to be lawful wife to the deceased, must be served, notwithstanding any objections by the heir against the marriage, which may be afterwards tried by the commissary.

Courtsey.

28. Courtsey is a liferent given by law, to the surviving husband, of all his wife's heritage in which she died in feif, if there was a child of the marriage born alive. A marriage, though of the longest continuance, gives no right to the courtsey, if there was no issue of it. The child born of the marriage must be the mother's heir: If she had a child of the former marriage, who is to succeed to her estate, the husband has no right to the courtsey while such child is alive; so that the courtsey is due to the husband, rather as father to an heir, than as husband to an heiress. Heritage is here opposed to conquest; and so is to be understood only of the heritable rights to which the wife succeeded as heir to her ancestors, excluding what she herself had acquired by singular titles.

29. Because the husband enjoys the life-rent of his wife's whole heritage, on a lucrative title, he is considered as her temporary representative; and so is liable in payment of all the yearly burdens chargeable on the subject, and of the current interest of all her debts, real and personal, to the value of the yearly rent he enjoys by the courtsey. The courtsey needs no solemnity to its constitution: That right, which the husband had to the rents of his wife's estate; during the marriage, *jure mariti*, is continued with him after her death, under the name of *courtsey*, by an act of the law itself. As in the *terce*, the husband's feifin is the ground and measure of the wife's right; so in the courtsey, the wife's feifin is the foundation of the husband's; and the two rights are, in all other respects, of the same nature; if it is not that the courtsey extends to burgage holdings, and to superiorities.

30. All liferenters must use their right *salva rei substantia*: whatever therefore is part of the fee itself, cannot be encroached on by the liferenter, *e. g.* woods or growing timber, even for the necessary uses of the

liferented tenement. But, where a coppice or *silva cadua* has been divided into hags, one of which was in use to be cut annually by the proprietor, the liferenter may continue the former yearly cuttings; because these are considered as the annual fruits the subject was intended to yield, and so the proper subject of a liferent.

31. Liferenters are bound to keep the subject liferented in proper repair. They are also burdened with the alimony of the heir, where he has not enough for maintaining himself. The bare right of apparency founds the action against the liferenter. It is a burden personal to the liferenter himself, and cannot be thrown upon his adjoining creditors as coming in his place by their diligences. Liferenters are also subjected to the payment of the yearly cesses, stipends, &c. falling due during their right, and to all other burdens that attend the subject liferented.

32. Liferent is extinguished by the liferenter's death. That part of the rents which the liferenter had a proper right to, before his death, falls to his executors; the rest, as never having been *in bonis* of the deceased, goes to the heir. Martinmas and Whitunday are, by our custom, the legal terms of the payment of rent: consequently, if a liferenter of lands survives the term of Whitunday, his executors are entitled to the half of that year's rent, because it was due the term before his death; and if he survives the Martinmas, they have right to the whole. If the liferenter, being in the natural possession, and having first sowed the ground, should die, even before the Whitunday, his executors are intitled to the whole crop, in respect that both seed and industry were his. In a liferent of money constituted by a moveable bond, the executors have a right to the interest, down to the very day of the liferenter's death, where no terms are mentioned for the payment thereof; but in the case of an heritable bond, or of a money liferent secured on land, the interests of liferenter and heir (or of heir and executor, for the same rules serve to fix the interests of both) are both governed by the legal terms of land-rent, without regard to the conventional.

elxxi.

Teinds.

TEINDS, or tithes, are that liquid proportion of our rents or goods, which is due to churchmen, for performing divine service, or exercising the other spiritual functions proper to their several offices. Most of the canonists affirm, that the precise proportion of a tenth, not only of the fruits of the ground, but of what is acquired by personal industry, is due to the Christian clergy, of divine right, which they therefore call the *proper patrimony of the church*; though it is certain that tithes, in their infancy, were given, not to the clergy alone, but to lay-monks who were called *pauperes*, and to other indigent persons. Charles the Great was the first secular prince who acknowledged this right in the church. It appears to have been received with us, as far back as David I.

2. The person employed by a cathedral church or monastery to serve the cure in a church annexed, was called a *vicar*, because he held the church, not in his own right, but in the right or *vice* of his employers; and so was removeable at pleasure, and had no share of the benefice, other than what they thought fit

to

Law of Scotland.

Law of Scotland.

to allow him: but, in the course of time, the appellation of *vicar* was limited to those who were made perpetual, and who got a slated share of the benefice for their incumbency; from whence arose the distinction of benefices into parsonages and vicarages.

3. Parsonage teinds are the teinds of corn; and they are so called because they are due to the parson or other titular of the benefice. Vicarage teinds are the small teinds of calves, lint, hemp, eggs, &c. which were commonly given by the titular to the vicar who served the cure in his place. The first sort was universally due, unless in the case of their infestation to laics, or of a pontifical exemption; but, by the customs of almost all Christendom, the lesser teinds were not demanded where they had not been in use to be paid. By the practice of Scotland, the teinds of animals, or of things produced from animals, as lambs, wool, calves, are due though not accustomed to be paid; but roots, herbs, &c. are not tithable, unless use of payment be proved: neither are personal teinds, *i. e.* the tenth of what one acquires by his own industry, acknowledged by our law; yet they have been found due, when supported by 40 years possession.

4. The parson who was entitled to the teind of corns, made his right effectual, either by accepting of a certain number of teind-bolls yearly from the proprietor in satisfaction of it; or, more frequently, by drawing or separating upon the field his own tenth part of the corns, after they were reaped, from the flock or the remaining nine tenths of the crop, and carrying it off to his own granaries; which is called *drawn teind*.

Annexation of church lands to the crown.

5. After the reformation, James VI. considered himself as proprietor of all the church-lands; partly because the purposes for which they had been granted were declared superstitious; and partly, in consequence of the resignations which he, and queen Mary his mother, had procured from the beneficiaries: and even as to the teinds, though our reformed clergy also claimed them as the patrimony of the church, our sovereign did not submit to that doctrine farther than extended to a competent provision for ministers. He therefore erected or secularised several abbacies and priories into temporal lordships; the grantees of which were called sometimes *lords of erection*, and sometimes *titulars*, as having by their grants the same title to the erected benefices that the monasteries had formerly.

6. As the crown's revenue suffered greatly by these erections, the temporality of all church benefices (*i. e.* church lands) was, by 1587. c. 29. annexed to the crown. That statute excepts from the annexation such benefices as were established before the reformation in laymen, whose rights the legislature had no intention to weaken. Notwithstanding this statute, his majesty continued to make farther erections, which were declared null by 1592. c. 119. with an exception of such as had been made in favour of lords of parliament since the general act of annexation in 1587.

7. King Charles I. soon after his succession, raised a reduction of all these erections, whether granted before or after the act of annexation, upon the grounds mentioned at length by Mr Forbes in his treatise of tithes, p. 259. At last the whole matter was referred to the king himself by four several submissions or compromises; in which the parties on one side were the titulars and their tacksmen, the bishops with the inferior

clergy, and the royal boroughs, for the interest they had in the teinds that were gifted for the provision of ministers, schools, or hospitals within their boroughs; and, on the other part, the proprietors who wanted to have the leading of their own teinds. The submission by the titulars contained a surrender into his majesty's hands of the superiorities of their several erections.

8. Upon each of these submissions his majesty pronounced separate decrees-arbitral, dated Sept. 2. 1629, which are subjoined to the acts of parliament of his reign. He made it lawful to proprietors to sue the titulars for a valuation, and if they thought fit for a sale also, of their teinds, before the commissioners named or to be named for that purpose. The rate of teind, when it was possessed by the proprietor jointly with the flock, for payment of a certain duty to the titular, and so did not admit a separate valuation, was fixed at a fifth part of the constant yearly rent, which was accounted a reasonable *surrogatum*, in place of a tenth of the increase. Where it was drawn by the titular, and consequently might be valued separately from the flock, it was to be valued as its extent should be ascertained upon a proof before the commissioners; but in this last valuation, the king directed the fifth part to be deducted from the proved teind, in favour of the proprietor, which was there called the *king's ease*. The proprietor suing for a valuation gets the leading of his own teinds as soon as his suit commences, providing he does not allow protestation to be extracted against him for not insinuing.

9. Where the proprietor insisted also for a sale of his teinds, the titular was obliged to sell them at nine years purchase of the valued teind-duty. If the pursuer had a tack of his own teinds, not yet expired; or if the defender was only tacksmen of the teinds, and so could not give the pursuer an heritable right; an abatement of the price was to be granted accordingly by the commissioners.

10. There is no provision in the decrees-arbitral, for selling the teinds granted for the sustentation of ministers, universities, schools, or hospitals; because these were to continue, as a perpetual fund, for the maintenance of the persons or societies to whom they were appropriated; and they are expressly declared not subject to sale, by 1690. c. 30.—1693; c. 23. By the last of these acts, it is also provided, that the teinds belonging to bishops, which had then fallen to the crown upon the abolishing of episcopacy, should not be subject to sale as long as they remained with the crown not disposed of; nor those which the proprietor, who had right both to flock and teind, referred to himself in a sale or feu of the lands. But, though none of these teinds can be sold, they may be valued.

11. The king, by the decrees arbitral, declared his own right to the superiorities of erection which had to be resigned to him by the submission, referring to the titulars the feu-duties thereof, until payment by himself to them of 1000 merks Scots for every chaldor of feu-victual, and for each hundred merks of feu-duty; which right of redeeming the feu-duties was afterwards renounced by the crown. If the church-vassal should consent to hold his lands of the titular, he cannot thereafter recur to the crown as his immediate superior.

12. In explaining what the constant rent is by which

Valuation of teinds.

King's right to the superiorities of erection.

which the teind must be valued, the following rules are observed. The rent drawn by the proprietor, from the sale of subjects, that are more properly parts of the land than of the fruits, *e.g.* quarries, minerals, mosses, &c. is to be deducted from the rental of the lands; and also the rent of supernumerary houses, over and above what is necessary for agriculture; and the additional rent that may be paid by the tenant, in consideration of the proprietor's undertaking any burden that law imposes on the tenant, *e.g.* upholding the tenant's houses, because none of these articles are paid properly on account of the fruits. Orchards must also be deducted, and mill-rent, because the profits of a mill arise from industry; and the corns manufactured there suffer a valuation as rent payable by the tenant, and therefore ought not to be valued a second time against the titular as mill-rent. The yearly expence of culture ought not to be deducted; for no rent can be produced without it: but, if an improvement of rent is made at an uncommon expence, *e.g.* by draining a lake, the proprietor is allowed a reasonable abatement on that account.

13. Notwithstanding the several ways of misapplying parochial teinds in the times of popery, some few benefices remained entire in the hands of the parsons. The ministers planted in these, after the reformation, continued to have the full right to them, as proper beneficiaries; but a power was afterwards granted to the patron, to redeem the whole teind from such beneficiaries, upon their getting a competent stipend modified to them; which teind so redeemed, the patron is obliged to sell to the proprietor, at six years purchase.

14. Some teinds are more directly subject to an allocation for the minister's stipend, than others. The teinds, in the hands of the lay titular, fall first to be allocated, who, since he is not capable to serve the cure in his own person, ought to provide one who can; and if the titular, in place of drawing the teind, has set it in tack, the tack-duty is allocated; this sort is called *free teind*. Where the tack-duty, which is the titular's interest in the teinds, falls short, the tack itself is burdened, or, in other words, the surplus teind over and above the tack-duty: but, in this case, the commissioners are empowered to recompense the tackfman, by prorogating his tack for such a number of years as they shall judge equitable. Where this likewise proves deficient, the allocation falls on the teinds heritably conveyed by the titular, unless he has warranted his grant against future augmentations; in which case, the teinds of the lands belonging in property to the titular himself must be allocated in the first place.

15. Where there is sufficiency of free teinds in a parish, the titular may allocate any of them he shall think fit for the minister's stipend, since they are all his own; unless there has been a previous decree of locality: and this holds, though the stipend should have been paid immemorially out of the teinds of certain particular lands. This right was frequently abused by titulars, who, as soon as a proprietor had brought an action of sale of his teinds, allocated the pursuer's full tent for the stipend, whereby such action became ineffectual: it was therefore provided, that after citation in a sale of teinds it shall not be in the titular's power to allocate the pursuer's teinds solely, but only in proportion with the other teinds in the parish.

16. Ministers glebes are declared free from the payment of teind. Lands *cum decimis inclusis* are also exempted from teind. But in order to exempt lands from payment of teind, it is necessary that the proprietor prove his right thereto, *cum decimis inclusis*, as far back as the above act of annexation 1587.

17. Teinds are *debita fructuum, not fundi*. The action therefore for bygone teinds is only personal, against those who have intermeddled, unless where the titular is infest in the lands, in security of the valued teind-duty. Where a tenant is, by his tack, bound to pay a joint duty to the landlord for stock and teind, without distinguishing the rent of each, his defence of a *bona fide* payment of the whole to the landlord has been sustained in a suit at the instance of a laic titular, but repelled where a churchman was pursuer. In both cases the proprietor who receives such rent is liable as intermeddler.

18. In tacks of teinds, as of lands, there is place for tacit relocation: to stop the effect of which, the titular must obtain and execute an inhibition of teinds against the tackfman; which differs much from inhibition of lands (explained under the next section), and is intended merely to interpel or inhibit the tackfman from farther intermeddling. This diligence of inhibition may also be used at the suit of the titular, against any other possessor of the teinds; and if the tackfman or possessor shall intermeddle after the inhibition is executed, he is liable in a spuilzie.

19. Lands and teinds pass by different titles: a disposition of lands therefore, though granted by one who has also right to the teind, will not carry the teind, unless it shall appear from special circumstances that a sale of both was designed by the parties. In lands *cum decimis inclusis*, where the teinds are consolidated with the stock, the right of both must necessarily go together in all cases.

### SECT. XI. Of Inhibitions.

THE constitution and transmission of feudal rights being explained, and the burdens with which they are chargeable, it remains to be considered, how these rights may be affected at the suit of creditors, by legal diligence. Diligences are certain forms of law, where, by a creditor endeavours to make good his payment, either by affecting the person of his debtor, or by securing the subjects belonging to him from alienation, or by carrying the property of these subjects to himself. They are either real or personal. Real diligence is that which is proper to heritable or real rights; personal, is that by which the person of the debtor may be secured, or his personal estate affected. Of the first sort we have two, *viz.* Inhibition and adjudication.

2. Inhibition is a personal prohibition, which passes by letters under the signet, prohibiting the party inhibited to contract any debt, or do any deed, by which any part of his lands may be aliened or carried off in prejudice of the creditor inhibiting. It must be executed against the debtor, personally, or at his dwelling-house, as summonses, and thereafter published and registered in the same manner with interdictions, (see No clxxxiii. 21.)

3. Inhibition may proceed, either upon a liquid obligation, or even on an action commenced by a creditor for making good a claim not yet sustained by the judge;

[ k ] which

Inhibition of teinds.

clxxi.

Diligences.

Inhibition.

Law of  
ScotlandLaw of  
Scotland

which last is called *inhibition upon a depending action*. The summons, which constitutes the dependence, must be executed against the debtor before the letters of inhibition pass the signet; for no suit can be said to depend against one, till he be cited in it as a defender: but the effect of such inhibition is suspended, till decree be obtained in the action against the debtor; and in the same manner, inhibitions on conditional debts have no effect till the condition be purified. Inhibitions are not granted, without a trial of the cause, when they proceed on conditional debts. And though, in other cases, inhibitions now pass of course, the lords are in use to stay, or recal them, either on the debtor's shewing cause why the diligence should not proceed, or even *ex officio* where the ground of the diligence is doubtful.

Limited to  
heritage.

4. Though inhibitions, by their uniform style, disable the debtor from selling his moveable as well as his heritable estate, their effect has been long limited to heritage, from the interruption that such an embargo upon moveables must have given to commerce; so that debts contracted after inhibition may be the foundation of diligence against the debtor's person and moveable estate. An inhibition secures the inhibitor against the alienation, not only of lands that belonged to his debtor when he was inhibited, but of those that he shall afterwards acquire: but no inhibition can extend to such after-purchases as lie in a jurisdiction where the inhibition was not registered; for it could not have extended to these, though they had been made prior to the inhibition.

5. This diligence only strikes against the voluntary debts or deeds of the inhibited person: it does not restrain him from granting necessary deeds, *i. e.* such as he was obliged to grant anterior to the inhibition, since he might have been compelled to grant these before the inhibitor had acquired any right by his diligence. By this rule, a wadsetter or annualreuter might, after being inhibited, have effectually renounced his right to the reverfer on payment, because law could have compelled him to it; but to secure inhibitors against the effect of such alienations, it is declared by act of sederunt of the court of session, Feb. 19. 1680, that, after intimation of the inhibition to the reverfer, no renunciation or grant of redemption shall be sustained, except upon declarator of redemption brought by him, to which the inhibitor must be made a party.

Is simply  
prohibitory.

6. An inhibition is a diligence simply prohibitory, so that the debt, on which it proceeds, continues personal after the diligence; and consequently, the inhibitor, in a question with anterior creditors whose debts are not struck at by the inhibition, is only preferable from the period at which his debt is made real by adjudication: and where debts are contracted on heretable security, though posterior to the inhibition, the inhibitor's debt, being personal, cannot be ranked with them; he only draws back from the creditors ranked the sums contained in his diligence. The heir of the person inhibited is not restrained from alienation, by the diligence used against his ancestor; for the prohibition is personal, affecting only the debtor against whom the diligence is used.

7. Inhibitions do not, of themselves, make void the posterior debts or deeds of the person inhibited; they only afford a title to the user of the diligence to set

them aside, if he finds them hurtful to him: and even where a debt is actually reduced *ex capite inhibitionis*, such reduction, being founded solely in the inhibitor's interest, is profitable to him alone, and cannot alter the natural preference of the other creditors.

8. Inhibitions may be reduced upon legal nullities, arising either from the ground of debt, or the form of diligence. When payment is made by the debtor to the inhibitor, the inhibition is said to be *purged*. Any creditor, whose debt is struck at by the inhibition, may, upon making payment to the inhibitor, compel him to assign the debt and diligence in his favour, that he may make good his payment the more effectually against the common debtor.

Purging of  
inhibition

## SECT. XII. Of Comprisings, Adjudications, and Judicial Sales.

clxxii

HERITABLE rights may be carried from the debtor to the creditor, either by the diligence of apprising (now adjudication), or by a judicial sale carried on before the court of session. Apprising, or comprising, was the sentence of a sheriff, or of a messenger who was specially constituted sheriff for that purpose, by which the heritable rights belonging to the debtor were sold for payment of the debt due to the appriser; so that apprisings were, by their original constitution, proper sales of the debtor's lands to any purchaser who offered. If no purchaser could be found, the sheriff was to apprise or tax the value of the lands by an inquest, (whence came the name of *apprising*), and to make over to the creditor lands to the value of the debt.

2. That creditors may have access to affect the estate of their deceased debtor, though the heir should stand off from entering, it is made lawful (by 1540, c. 106.) for any creditor to charge the heir of his debtor to enter to his ancestor, year and day being past after the ancestor's death, within 40 days after the charge; and if the heir fails, the creditor may proceed to apprise his debtor's lands, as if the heir had been entered. Custom has so explained this statute, that the creditor may charge the heir, immediately after the death of his ancestor, provided letters of apprising be not raised till after the expiry both of the year and of the 40 days next ensuing the year, within which the heir is charged to enter. But this statute relates only to such charges on which apprising is to be led against the ancestor's lands; for, in those which are to be barely the foundation of a common summons or process against the heir, action will be sustained if the year be elapsed from the ancestor's death before the execution of the summons, though the 40 days should not be also expired. Though the statute authorises such charges against majors only, practice has also extended it against minors, and the rule is extended to the case where the heir is the debtor. One must, in this matter, distinguish between a general and a special charge. A general charge serves only to fix the representation of the heir who is charged, so as to make the debt his which was formerly his ancestor's: but a special charge makes up for the want of a service (N<sup>o</sup> clxxx. 25.); and states the heir, *filius juris*, in the right of the subjects to which he is charged to enter. Where, therefore, the heir is the debtor, a general charge for fixing the representation against him is unnecessary, since the only concern of the creditor is, that his debtor make

Apprising

make

of  
land.

adica-

make up titles to the ancestor's estate, which is done by a special charge: but where the deceased was the debtor, the creditor must first charge his heir to enter in general, that it may be known whether he is to represent the debtor: if he does not enter within 40 days, the debt may be fixed against him by a decree of constitution, on which he must be charged to enter heir in special, upon 40 days more; and these must be elapsed before the creditor can proceed to apprise.

3. Apprisings in course of time underwent many changes in their form and effect, till at length, by act 1672, c. 19. adjudications were substituted in their place, which directed to proceed against debtors by way of action before the court of session. By that statute, such part of the debtor's lands is to be adjudged as is equivalent to the principal sum and interest of the debt, with the composition due to the superior and expenses of infestment, and a fifth part more in respect the creditor is obliged to take land for his money. The debtor must deliver to the creditor a valid right of the lands to be adjudged, or transmits thereof, renounce the possession in his favour, and ratify the decree of adjudication: and law considers the rent of the lands as precisely commensurate to the interest of the debt; so that the adjudger lies under no obligation to account for the surplus rents. In this, which is called a *special adjudication*, the legal, or time within which the debtor may redeem, is declared to be five years; and the creditor attaining possession upon it can use no further execution against the debtor, unless the lands be evicted from him.

4. Where the debtor does not produce a sufficient right to the lands, or is not willing to renounce the possession, and ratify the decree, (which is the case that has most frequently happened), the statute makes it lawful for the creditor to adjudge all right belonging to the debtor in the same manner, and under the same reversion of ten years, as he could, by the former laws, have apprised it. In this last kind, which is called a *general adjudication*, the creditor must limit his claim to the principal sum, interest, and penalty, without demanding a fifth part more. But no general adjudication can be inflicted on, without libelling in the summons the other alternative of a special adjudication: for special adjudications are introduced by the statute in the place of apprisings; and it is only where the debtor refuses to comply with the terms thereof, that the creditor can lead a general adjudication.

5. Abbreviates are ordained to be made of all adjudications, which must be recorded within 60 days after the date of the decree. In every other respect, general adjudications have the same effects that apprisings had; adjudgers in possession are accountable for the surplus rents; a citation in adjudications renders the subject litigious; superiors are obliged to enter adjudgers; the legal of adjudications does not expire during the debtor's minority, &c. Only it may be observed, that though apprisings could not proceed before the term of payment, yet where the debtor is *vergens ad inopiam*, the court *ex nobili officio* admit adjudication for the debt before it be payable. But this sort being founded solely in equity, subsists merely as a security, and cannot carry the property to the creditor by any length of time.

6. There are two kinds of adjudication, which took

place at the same time with apprisings, and still obtain; viz. adjudications on a decree *cognitionis causis*, otherwise called *contra hereditatem jacentem*; and adjudications in implement. Where the debtor's appraiser heir, who is charged to enter, formally renounces the succession, the creditor may obtain a decree *cognitionis causis*; in which, though the heir renouncing is cited for the sake of form, no sentence condemnatory can be pronounced against him, in respect of his renunciation; the only effect of it is to subject the *hereditas jacentis* to the creditor's diligence.

7. Adjudications *contra hereditatem jacentem*, carry not only the lands themselves that belonged to the deceased, but the rents thereof fallen due since his death; for these, as an accessory to the estate belonging to the deceased, would have descended to the heir if he had entered, which rule is applied to all adjudications led on a special charge. This sort of adjudication is declared redeemable within seven years, by any co-adjudging creditor, either of the deceased debtor, or of the heir renouncing. The heir himself, who renounces, cannot be restored against his renunciation, nor consequently redeem, if he be not a minor. But even a major may redeem indirectly, by granting a simulate bond to a confident person; the adjudication upon which, when conveyed to himself, is a good title to redeem all other adjudications against the lands belonging to his ancestor.

8. Adjudications in implement are deduced against those who have granted deeds without procuratory of resignation or precept of feisin, and refuse to divest themselves; to the end that the subject conveyed may be effectually vested in the grantee. These adjudications may be also directed against the heir of the granter, upon a charge to enter. Here there is no place for a legal reversion; for, as the adjudication is led for completing the right of a special subject, it must carry that subject as irredeemably as if the right had been voluntarily completed.

9. All adjudications led within year and day of that one which has been made first effectual by feisin (where feisin is necessary), or exact diligence for obtaining feisin, are preferable *pari passu*. The year and day runs from the date of the adjudication, and not of the feisin or diligence for obtaining it. After the days of that period, they are preferable according to their dates. All the co-adjudgers within the year are preferable *pari passu*, as if one adjudication had been led for all their debts. This makes the feisin or diligence on the first adjudication a common right to the rest, who must therefore refund to the owner of that diligence his whole expense laid out in carrying on and completing it. And tho' that first adjudication should be redeemed, the diligence upon it still subsists as to the rest. This *pari passu* preference, however, does not destroy the legal preference of adjudications led on *debita fundis*, (see No clxix. 15.); nor does it take place in adjudications in implement.

10. Before treating of judicial sales of bankrupts estates, the nature of sequestration may be shortly explained, which is a diligence that generally useth in actions of sale. Sequestration of lands is a judicial act of the court of session, whereby the management of an estate is put into the hands of a factor or steward named by the court, who gives security, and is to be account-

Law of  
Scotland.  
Two kinds  
of adjudica-  
tions.

Law of  
Scotland.

able for the rents to all having interest. This diligence is competent, either where the right of the lands is doubtful, if it be applied for before either of the competitors has attained possession; or where the estate is heavily charged with the debts: but, as it is an unfavourable diligence, it is not admitted, unless that measure shall appear necessary for the security of creditors. Subjects, not brought before the court by the diligence of creditors, cannot fall under sequestration; for it is the competition of creditors which alone founds the jurisdiction of the court to take the disputed subject into their possession.

11. The court of session who decrees the sequestration has the nomination of the factor, in which they are directed by the recommendation of the creditors. A factor appointed by the session, though the proprietor had not been sequestrated in the lands, has a power to remove tenants. Judicial factors must, within six months after extracting their factory, make up a rental of the estate, and a list of the arrears due by tenants, to be put into the hands of the clerk of the process, as a charge against themselves, and a note of such alterations in the rental as may afterwards happen; and must also deliver to the clerk annually a scheme of their accounts, charge and discharge, under heavy penalties. They are, by the nature of their office, bound to the same degree of diligence that a prudent man adhibits in his own affairs; they are accountable for the interest of the rents, which they either have, or by diligence might have recovered, from a year after their falling due. As it is much in the power of those factors to take advantage of the necessities of creditors, by purchasing their debts at an undervalue, all such purchases made either by the factor himself, or to his behoof, are declared equivalent to an acquittance or extinction of the debt. No factor can warrantably pay to any creditor, without an order of the court of session; for he is, by the tenor of his commission, directed to pay the rents to those who shall be found to have the best right to them. Judicial factors are intitled to a salary, which is generally stated at five *per cent.* of their intromissions: but it is seldom ascertained till their office expires, or till their accounting; that the court may modify a greater or smaller salary, or none, in proportion to the factor's integrity and diligence. Many cases occur, where the court of session, without sequestration, name a factor to preserve the rents from perishing; *e. g.* where an heir is deliberating whether to enter, where a minor is without tutors, where a succession opens to a person residing abroad; in all which cases, the factor is subjected to the rules laid down in act of federunt, Feb. 13. 1730.

Side of  
bankrupt  
estates.

12. The word *bankrupt* is sometimes applied to persons whose funds are not sufficient for their debts; and sometimes, not to the debtor, but to his estate. The court of session are empowered, at the suit of any real creditor, to try the value of a bankrupt's estate, and sell it for the payment of his debts.

13. No process of sale, at the suit of a creditor, can proceed without a proof of the debtor's bankruptcy, or at least that his lands are so charged with debts that no prudent persons will buy from him; and therefore the summons of sale must comprehend the debtor's whole estate. The debtor, or his apparent heir, and all the real creditors in possession, must be made par-

ties to the suit; but it is sufficient if the other creditors be called by an edictal citation. The summons of sale contains a conclusion of ranking or preference of the bankrupt's creditors. In this ranking, first and second terms are assigned to the whole creditors for exhibiting in court (or producing) their rights and diligences; and the decree of certification proceeding thereupon, against the writings not produced, has the same effect in favour of the creditors who have produced their rights, as if that decree had proceeded upon an action of reduction-improbatum. See N<sup>o</sup> clxxxiii. 3. The ranking of these creditors must be concluded by an extracted decree, before the actual sale. The irredeemable property of the lands is adjudged by the court to the highest offerer at the sale. The creditors receiving payment must grant to the purchaser absolute warrantice, to the extent of the sum received by them; and the lands purchased are declared disburdened of all debts or deeds of the bankrupt, or his ancestors, either on payment of the price by the purchaser to the creditors according to their preference, or on consignation of it, in case of their refusal, in the hands of the magistrates of Edinburgh: the only remedy provided to such creditors as judge themselves hurt by the sale or division of the price, even though they should be minors, is an action for recovering their share of the price against the creditors who have received it.

14. The expence of these processes is debursed by the factor out of the rents in his hands; by which the whole burden of such expence falls upon the posterior creditors.

15. Apparent heirs are intitled to bring actions of sale of the estates belonging to their ancestors, whether bankrupt or not; the expence of which ought to fall upon the pursuer, if there is any excrescence of the price, after payment of the creditors.

16. As processes of ranking and sale are designed for the common interest of all the creditors, no diligence carried on or completed during their pendency ought to give any preference in the competition; *pendente lite, nihil innovandum.*

17. It is a rule in all real diligences, that where a creditor is preferable on several different subjects, he cannot use his preference arbitrarily, by favouring one creditor more than another; but must allocate his universal or catholic debt proportionally against all the subjects or parties whom it affects. If it is material to such creditor to draw his whole payment out of any one fund, he may apply his debt so as may best secure himself: but that inequality will be rectified as to the posterior creditors, who had likewise, by their rights and diligences, affected the subjects out of which he drew his payment, by obliging him to assign in their favour his right upon the separate subjects which he did not use in the ranking; by which they may recur against these separate subjects for the shares which the debt preferred might have drawn out of them. As the obligation to assign is founded merely in equity, the catholic creditor cannot be compelled to it, if his assigning shall weaken the preference of any separate debt vested in himself, affecting the special subject sought to be assigned. But if a creditor upon a special subject shall acquire from another a catholic right, or a catholic creditor shall purchase a debt affecting a special sub-

creditors.

ject,

ject, with a view of creating to the special debt a higher degree of preference than was naturally due to it, by an arbitrary application of the catholic debt, equity cannot protect him from assigning in favour of the creditor excluded by such application, especially if, prior to the purchase, the subject had become litigious by the process of ranking; for transmissions ought not to have creditors who are no parties to them, nor to give the purchaser any new right which was not formerly in himself or his cedent.

## II. MOVEABLE RIGHTS.

THE law of heritable rights being explained, Moveable Rights fall next to be considered; the doctrine of which depends chiefly on the nature of Obligations.

### SECT. XIII. Of Obligations and Contracts in general.

AN obligation is a legal tie, by which one is bound to pay or perform something to another. Every obligation on the person obliged, implies an opposite right in the creditor, so that what is a burden in regard to the one is right with respect to the other; and all rights founded on obligations are called *personal*. There is this essential difference between a real and a personal right, that a *ius in re*, whether of property, or of an inferior kind as servitude, entitles the person vested with it to possess the subject as his own; or if he is not in possession, to demand it from the possessors: whereas the creditor in a personal right has only *ius ad rem*, or a right to compel the debtor to fulfil his obligation; without any right in the subject itself, which the debtor is bound to transfer to him. One cannot oblige himself, but by a present act of the will. A bare resolution therefore, or purpose, to be obliged, is alterable at pleasure.

2. Obligations are either, (1.) Merely natural, where one person is bound to another by the law of nature, but cannot be compelled by any civil action to the performance. Thus, though deeds granted by a minor having curators, without their consent, are null, yet the minor is naturally obliged to perform such deeds; and parents are naturally obliged to provide their children in reasonable patrimonies. Natural obligations intitle the creditor to retain what he has got in virtue thereof, without being subjected to restore it. (2.) Obligations are merely civil, which may be sued upon by an action, but are elided by an exception in equity; this is the case of obligations granted through force or fear, &c. (3.) Proper or full obligations, are those which are supported both by equity and the civil sanction.

3. Obligations may be also divided into, (1.) Pure, to which neither day nor condition is adjoined. These may be exacted immediately. (2.) Obligations (*ex die*), which have a day adjoined to their performance. In these, *dies statim cedit, sed non venit*; a proper debt arises from the date of the obligation, because it is certain that the day will exist; but the execution is suspended till the lapse of that day. (3.) Conditional obligations; in which there is no proper debt (*dies non credit*) till the condition be purified, because it is possible the condition may never exist; and which therefore are said to create only the hope of a debt; but the granter, even of these, has no right to refile. An obli-

gation, to which a day is adjoined that possibly may never exist, implies a condition; *dies incertus pro conditione habetur*. Thus, in the case of a provision to a child, payable when he attains to the age of fourteen, if the child dies before that age, the provision falls.

4. Obligations, when considered with regard to their cause, were divided by the Romans, into those arising from contract, quasi contract, delict, and quasi delict: but there are certain obligations, even full and proper ones, which cannot be derived from any of these sources, and to which Lord Stair gives the name of *obediential*. Such as the obligation on parents to aliment or maintain their children; which arises singly from the relation of parent and child, and may be enforced by the civil magistrate. Under parents are comprehended the mother, grandfather, and grandmother, in their proper order. This obligation on parents extends to the providing of their issue in all the necessaries of life, and giving them suitable education. It ceases, when the children can earn a livelihood by their own industry; but the obligation on parents to maintain their indigent children, and reciprocally on children to maintain their indigent parents, is perpetual. This obligation is, on the father's death, transferred to the eldest son, the heir of the family; who, as representing the father, must aliment his younger brothers and sisters: the brothers are only intitled to alimony, till their age of twenty-one, after which they are presumed able to do for themselves; but the obligation to maintain the sisters continues till their marriage. In persons of lower rank, the obligation to aliment the sisters ceases after they are capable of subsisting by any service or employment.

5. All obligations, arising from the natural duty of restitution, fall under this class: thus, things given upon the view of a certain event, must be restored, if that event does not afterwards exist: thus also, things given *ob turpem causam*, where the turpitude is in the receiver and not in the giver, must be restored. And on the same principle, one upon whose ground a house is built or repaired by another, is obliged, without any covenant, to restore the expence laid out upon it, in so far as it has been profitable to him.

6. A contract is the voluntary agreement of two or more persons, whereby something is to be given or performed upon one part, for a valuable consideration, either present or future, on the other part. Consent, which is implied in agreement, is excluded, (1.) By error in the essentials of the contract; for, in such case, the party does not properly contract, but errs or is deceived; and this may be also applied to contracts which take their rise from fraud or imposition. (2.) Consent is excluded by such a degree of restraint upon any of the contracting parties, as extorts the agreement; for where violence or threatening are used against a person, his will has really no part in the contract.

7. Loan, or *mutuum*, is that contract which obliges Loan. a person, who has borrowed any fungible subject from another, to restore to him as much of the same kind, and of equal goodness. Whatever receives its estimation in number, weight, or measure, is a fungible; as corn, wine, current coin, &c. The only proper subjects of this contract are things which cannot be used without either their extinction or alienation: hence,

Law of  
Scotland.

the property of the thing lent is necessarily transferred by delivery to the borrower, who consequently must run all the hazards, either of its deterioration or its perishing, according to the rule, *res perit suo domino*. Where the borrower neglects to restore at the time and place agreed on, the estimation of the thing lent must be made according to its price at that time and in that place; because it would have been worth so much to the lender, if the obligation had been duly performed. If there is no place nor time stipulated for, the value is to be stated according to the price that the commodity gave when and where it was demanded. In the loan of money, the value put on it by public authority, and not its intrinsic worth, is to be considered. This contract is obligatory only on one part; for the lender is subjected to no obligation: the only action therefore that it produces, is pointed against the borrower, that he may restore as much in quantity and quality as he borrowed, together with the damage the lender may have suffered through default of due performance.

Commodate

8. Commodate is a species of loan, gratuitous on the part of the lender, where the thing lent may be used, without either its perishing or its alienation. Hence, in this sort of loan, the property continues with the lender: the only right the borrower acquires in the subject is its use, after which he must restore the individual thing that he borrowed: consequently, if the subject perishes, it perishes to the lender, unless it has perished by the borrower's fault. What degree of fault or negligence makes either of the contracting parties liable to the other in damages, is comprehended under the following rules. Where the contract gives a mutual benefit to both parties, each contractor is bound to adhibit a middle sort of diligence, such as a man of ordinary prudence uses in his affairs. Where only one of the parties has benefit by the contract, that party must use exact diligence; and the other who has no advantage by it, is accountable only for dolo, or for gross omissions which the law construes to be dolo. Where one employs less care on the subject of any contract which implies an exuberant trust, than he is known to employ in his own affairs, it is considered as dolo.

9. By these rules, the borrower in the contract of commodate must be exactly careful of the thing lent, and restore it at the time fixed by the contract, or after that use is made of it for which it was lent: if he puts it to any other use, or neglects to restore it at the time covenanted, and if the thing perishes thereafter, even by mere accident, he is bound to pay the value. On the other part, the lender is obliged to restore to the borrower such of the expences debursed by him on that subject as arose from any uncommon accident, but not those that naturally attend the use of it. Where a thing is lent gratuitously, without specifying any time of redelivery, it constitutes the contract of *precarium*, which is revocable at the lender's pleasure, and, being entered into from a personal regard to the borrower, ceases by his death.

Depositio-  
tion.

10. Depositio is a contract, by which one who has the custody of a thing committed to him (the depositary) is obliged to restore it to the depositor. If a reward is bargained for by the depositary for his care, it resolves into the contract of location. As this contract is gratuitous, the depositary is only answerable for the consequences of gross neglect; but after the depo-

fit is redemanded, he is accountable even for casual misfortunes. He is intitled to a full indemnification for the losses he has sustained by the contract, and to the recovery of all sums expended by him on the subject.

Law of  
Scotland.  
Nante, e-  
pone, fl-  
lari.

11. An obligation arises without formal paction, barely by a traveller's entering into an inn, ship, or stable, and there depositing his goods, or putting up his horses; whereby the innkeeper, shipmaster, or stable, is accountable, not only for his own facts and those of his servants, (which is an obligation implied in the very exercise of these employments), but of the other guests or passengers; and, indeed, in every case, unless where the goods have been lost *damno fatali*, or carried off by pirates or house-breakers. Not only the masters of ships, but their employers, are liable each of them for the share that he has in the ship; but by the present custom of trading nations, the goods brought into a ship must have been delivered to the master or mate, or entered into the ship-books. Carriers fall within the intendment of this law; and practice has extended it to vintners within borough. The extent of the damage sustained by the party may be proved by his own oath in *litern*.

12. Sequestration, whether voluntarily consented to by the parties, or authorized by the judge, is a kind of deposit; but as the office of sequestrator, to whose care the subject in dispute is committed, is not considered as gratuitous, he cannot throw it up at pleasure, as a common depositary may do; and he is liable in the middle degree of diligence. Confignation of money is also a deposit. It may be made, either where the debt is called in question by the debtor, as in suspensions; or where the creditor refuses to receive his money, as in wadsets, &c. The risk of the configned money lies on the configner, where he ought to have made payment, and not confignation; or has configned only a part; or has chosen for confignatory, a person neither named by the parties nor of good credit. The charger, or other creditor, runs the risk, if he has charged for sums not due, or has without good reason refused payment, by which refusal the confignation became necessary. It is the office of a confignatory, to keep the money in safe custody till it be called for: if therefore he puts it out at interest, he must run the hazard of the debtor's insolvency; but, for the same reason, though he should draw interest for it, he is liable in none to the configner.

Confign-  
tion.

13. Pledge, when opposed to wadset, is a contract, Pledge, by which a debtor puts into the hands of his creditor a special moveable subject in security of the debt, to be redelivered on payment. Where a security is established by law to the creditor, upon a subject which continues in the debtor's possession, it has the special name of an hypothec. Tradesmen and ship-carpenters have an hypothec on the house or ship repaired, for the materials and other charges of reparation; but not for the expence of building a new ship. Owners of ships have an hypothec on the cargo for the freight; heritors on the fruits of the ground, and landlords on the *invecta et illata*, for their rents. Writers also, and agents, have a right of hypothec, or more properly of retention, in their constituent's writings, for their claim of pains and debursments. A creditor cannot, for his own payment, sell the subject impignorated, without applying

written  
obligations.

applying to the judge-ordinary for a warrant to put it up to public sale or roup; and to this application the debtor ought to be made a party.

SECT. XIV. Of Obligations by Word or Writ.

THE appellation of *verbal* may be applied to all obligations to the constitution of which writing is not essential, which includes both real and consensual contracts; but as these are explained under separate titles, obligations by *word*, in the sense of this rubric, must be restricted, either to promises, or to such verbal agreements as have no special name to distinguish them. Agreement implies the intervention of two different parties, who come under mutual obligations to one another. Where nothing is to be given or performed but on one part, it is properly called a *promise*; which, as it is gratuitous, does not require the acceptance of him to whom the promise is made. An offer, which must be distinguished from a promise, implies something to be done by the other party; and consequently is not binding on the offeror, till it be accepted, with its limitations or conditions, by him to whom the offer is made; after which, it becomes a proper agreement.

2. Writing must necessarily intervene in all obligations and bargains concerning heritable subjects, tho' they should be only temporary; as tacks, which, when they are verbal, last but for one year. In these, no verbal agreement is binding, though it should be referred to the oath of the party; for, till writing is adhibited, law gives both parties a right to refile, as from an unquished bargain; which is called *locus penitentiae*. If, upon a verbal bargain of lands, part of the price shall be paid by him who was to purchase, the *interventus rei*, the actual payment of money, creates a valid obligation, and gives a beginning to the contract of sale; and, in general, where-ever matters are no longer entire, the right to refile seems to be excluded. An agreement, whereby a real right is passed from, or restricted, called *pactum liberatorium*, may be perfected verbally; for freedom is favourable, and the purpose of such agreement is rather to dissolve than to create an obligation. Writing is also essential to bargains made under condition that they shall be reduced into writing; for in such cases, it is *pars contractus*, that, till writing be adhibited, both parties shall have liberty to withdraw. In the same manner, verbal or uncaputative testaments are rejected by our law; but verbal legacies are sustained, where they do not exceed *L. 100 Scots*.

3. Anciently, when writing was little used, deeds were executed by the party appending his seal to them, in presence of witnesses. For preventing frauds that might happen by appending seals to false deeds, the subscription also of the grantor was afterwards required, and, if he could not write, that of a notary. As it might be of dangerous consequence to give full force to the subscription of the parties by initials, which is more easily counterfeited; our practice, in order to sustain such subscription, seems to require a proof, not only that the grantor used to subscribe in that way, but that *de facto* he had subscribed the deed in question; at least, such proof is required, if the instrumentary witnesses be still alive.

4. As a further check, it was afterwards provided that all writings carrying any heritable right, and o-

ther deeds of importance, be subscribed by the principal parties, if they can subscribe; otherwise, by two notaries, before four witnesses specially designed. The subsequent practice extended this requisite of the designation of the witnesses to the case where the parties themselves subscribed. Custom has construed obligations for sums exceeding *L. 100 Scots*, to be obligations of importance. In a divisible obligation, *ex. gr.* for a sum of money, though exceeding *L. 100*, the subscription of one notary is sufficient, if the creditor restricts his claim to *L. 100*: But in an obligation indivisible, *e. g.* for the performance of a fact, if it be not subscribed in terms of the statute, it is void. When notaries thus attest a deed, the attestation or docquet must specially express that the grantor gave them a mandate to sign; nor is it sufficient that this be mentioned in the body of the writing.

5. In every deed, the name of him who writes it, with his dwelling-place, or other mark of distinction, must be inserted. The witnesses must both subscribe as witnesses, and their names and designations be inserted in the body of the deed: And all subscribing witnesses must know the grantor, and either see him subscribe, or hear him acknowledge his subscription; otherwise they are declared punishable as accessory to forgery. Deeds, decrees, and other securities, consisting of more than one sheet, may be written by way of book, in place of the former custom of putting together the several sheets, and signing the joinings on the margin; provided each page be signed by the grantor, and marked by its number, and the testing clause express the number of pages.

6. Instruments of seisin are valid, if subscribed by one notary, before a reasonable number of witnesses; which is extended by practice to instruments of resignation. Two witnesses are deemed a reasonable number to every deed that can be executed by one notary. It is not necessary, that the witnesses to a notarial instrument, or execution, see the notary or messenger sign; for they are called as witnesses to the transaction which is attested, and not to the subscription of the person attesting.

7. A new requisite has been added to certain deeds since the union, for the benefit of the revenue: They must be executed on stamped paper, or parchment, paying a certain duty to the crown. Charters, instruments of resignation, seilins, and retours of lands holden of a subject, are charged with *2 s. 3 d.* of duty: Bonds, tacks, contracts, and other personal obligations, paid at first *6 d.* to which further additions have since, at different times, been made, the duty at present amounting to *4 s.* Bail-bonds, bills, testaments, discharges, or acquittances of rent or of interest, and judicial deeds, as notarial instruments, bonds of cautionry in suspensions, &c. are excepted.

8. The grantor's name and designation are essential, not properly as solemnities, but because no writing can have effect without them. Bonds were, by our ancient practice, frequently executed without filling up the creditor's name; and they passed from hand to hand, like notes payable to the bearer: But as there was no method for the creditor of a person possessed of these to secure them for his payment, all writings taken blank in the creditor's name are declared null, as covers to fraud; with the exception of indorations of bills of exchange.

9. Certain

Solemnities  
of notarial  
instruments  
&c.

Blank  
bonds.

Law of  
Scotland.  
Privileged  
deeds.

9. Certain privileged writings do not require the ordinary solemnities. 1. Holograph deeds (written by the grantor himself) are effectual without witnesses. The date of no holograph writing, except a bill of exchange, (see next paragraph.) can be proved by the grantor's own assertion, in prejudice either of his heir or his creditors, but must be supported by other adminicles. 2. Testaments if executed where men of skill and business cannot be had, are valid though they should not be quite formal: and let the subject of a testament be ever so valuable, one notary signing for the testator, before two witnesses, is in practice sufficient. Clergymen were frequently notaries before the reformation; and, though they were afterwards prohibited to act as notaries, the case of testaments is excepted; so that these are supported by the attestation of one minister, with two witnesses. 3. Discharges to tenants are sustained without witnesses, from their presumed rusticity, or ignorance in business. 4. Misive letters in *re mercatoria*, commissions, and fitted accounts in the course of trade, and bills of exchange, though they are not holographs, are, from the favour of commerce, sustained without the ordinary solemnities.

Bills of ex-  
change.

10. A bill of exchange is an obligation in the form of a mandate, whereby the drawer or mandant desires him to whom it is directed, to pay a certain sum, at the day and place therein mentioned, to a third party. Bills of exchange are drawn by a person in one country to his correspondent in another; and they have that name, because it is the exchange, or the value of money in one place compared with its value in another, that generally determines the precise extent of the sum contained in the draught. The creditor in the bill is sometimes called the possessor, or *porteur*. As parties to bills are of different countries, questions concerning them ought to be determined by the received custom of trading nations, unless where special statute interposes. For this reason, bills of exchange, though their form admits not of witnesses, yet prove their own dates, in questions either with the heir, or creditors of the debtor; but this doctrine is not extended to inland bills payable to the drawer himself.

Their solem-  
nities and obli-  
gations.

11. A bill is valid, without the designation, either of the drawer, or of the person to whom it is made payable: It is enough, that the drawer's subscription appears to be truly his; and one's being possessor of a bill marks him out to be the creditor, if he bears the name given in the bill to the creditor: Nay, though the person drawn on should not be designated, his acceptance presumes that it was he whom the drawer had in his eye. Bills drawn blank, in the creditor's name, fall under the statutory nullity; for though indorsements of bills are excepted from it, bills themselves are not. Not only the person drawn upon must sign his acceptance, but the drawer must sign his draught, before any obligation can be formed against the acceptor: Yet it is sufficient in practice, that the drawer signs before the bill be produced in judgment; though it should be after the death both of the creditor and acceptor. A creditor in a bill may transmit it to another by indorsement, though the bill should not bear *to his order*; by the same rule that other rights are transmissible by assignation, though they do not bear *to assignees*.

Obligations

12. The drawer, by signing his draught, becomes liable for the value to the creditor in the bill, in case

the person drawn upon either does not accept, or after acceptance does not pay; for he is presumed to have received value from the creditor at giving him the draught, though it should not bear *for value received*: But, if the drawer was debtor to the creditor in the bill before the draught, the bill is presumed to be given towards payment of the debt, unless it expressly bears *for value*. The person drawn upon, if he refuse to accept, while he has the drawer's money in his hands, is liable to him in damages. As a bill presumes value from the creditor, indorsement presumes value from the indorsee; who therefore, if he cannot obtain payment from the acceptor, has recourse against the indorser, unless the bill be indorsed in these words, *without recourse*.

13. Payment of a bill, by the acceptor, acquits both the drawer and him at the hands of the creditor: but it intitles the acceptor, if he was not the drawer's debtor, to an action of recourse against him; and, if he was, to a ground of compensation. Where the bill does not bear value in the hands of the person drawn upon, it is presumed that he is not the drawer's debtor, and consequently he has recourse against the drawer, *ex mandato*.

14. Bills, when indorsed, are considered as so many bags of money delivered to the onerous indorsee; which therefore carry right to the contents, free of all burdens that do not appear on the bills themselves. Hence, a receipt or discharge, by the original creditor, if granted on a separate paper, does not exempt the acceptor from second payment to the indorsee; hence, also, no ground of compensation competent to the acceptor against the original creditor can be pleaded against the indorsee: but, if the debtor shall prove, by the oath of the indorsee, that he paid not the full value for the indorsement, the indorsee is justly considered as but a name; and therefore all exceptions, receivable against the original creditor, will be sustained against him.

15. Bills must be negotiated by the possessor, against Negotiation the person drawn upon, within a precise time, in order to preserve recourse against the drawer. In bills payable so many days after sight, the creditor has a discretionary power of fixing the payment somewhat sooner or later, as his occasions shall require. Bills payable on a day certain, need not be presented for acceptance till the day of payment, because that day can neither be prolonged nor shortened by the time of acceptance. For the same reason, the acceptance of bills, payable on a precise day, need not be dated: but, where a bill is drawn payable so many days after sight, it must; because there the term of payment depends on the date of the acceptance.

16. Though bills are, in strict law, due the very day on which they are made payable, and may therefore be grace protested on the day thereafter; yet there are three days immediately following the day of payment, called *days of grace*, within any of which the creditor may protest the bill: but if he delay protesting till the day after the last day of grace, he loses his recourse. Where a bill is protested, either for not acceptance or not payment, the dishonour must be notified to the drawer or indorser, within three posts at farthest. This strictness of negotiation is confined to such bills as may be protested by the possessor upon the third day of grace: where, therefore, bills are indorsed after the days of grace are expired, the indorsee is left more at liberty, and

Law of  
Scotland.

Law of Scotland.

and does not lose his recourse, tho' he should not take a formal protest for not payment, if, within a reasonable time, he shall give the indorser notice of the acceptor's refusing to pay. Not only does the possessor, who neglects strict negotiation, lose his recourse against the drawer, where the person drawn upon becomes afterwards bankrupt; but tho' he should continue solvent: for he may, in that case, recover payment from the debtor, and so is not to be indulged in an unnecessary process against the drawer, which he has tacitly renounced by his negligence. Recourse is preserved against the drawer, though the bill should not be duly negotiated, if the person drawn upon was not his debtor; for there the drawer can qualify no prejudice by the neglect of diligence, and, he ought not to have drawn on one who owed him nothing.

Privileges of bills by statute.

17. The privileges superadded to bills by statute are, that though, by their form, they can have no clause of registration, yet, if duly protested, they are registrable within six months after their date in case of not acceptance, or in six months after the term of payment in the case of not payment; which registration is made the foundation of summary diligence, either against the drawer or indorser in the case of not acceptance, or against the acceptor in the case of not payment. This is extended to inland bills, *i. e.* bills both drawn and made payable in Scotland. After acceptance, summary diligence lies against no other than the acceptor; the drawer and indorser must be pursued by an ordinary action. It is only the principal sum in the bill, and interest, that can be charged for summarily: the re-exchange, when it is not included in the draught, the re-exchange incurred by suffering the bill to be protested and returned, and the expence of diligence, must all be recovered by an ordinary action; because there are not liquid debts, and so must be previously constituted.

Inland bills.

Inland bills not privileged.

18. Bills, when drawn payable at any considerable distance of time after date, are denied the privileges of bills; for bills are intended for currency, and not to lie as a security in the creditor's hands. Bills are not valid which appear *ex facie* to be donations. No extrinsic stipulation ought to be contained in a bill which deviates from the proper nature of bills: hence, a bill to which a penalty is adjoined, or with a clause of interest from the date, is null. Inland precepts drawn, not for money the medium of trade, but for fungibles, are null, as wanting writer's name and witnesses. It is not an agreed point whether promissory notes, without writer and witnesses, unless holograph, are probative.

The alterations as to bills and promissory notes.

19. By 12th Geo. III. c. 72. the law of Scotland has undergone very material alterations as to bills and promissory notes. By that act, they are declared to have the same privileges, and to prescribe in six years after the term of payment. Bank-notes and post-bills are excepted from this prescription; nor does it run during the years of the creditor's minority. Inland bills and promissory notes must be protested within the days of grace, to secure recourse; and the dishonour notified within 14 days after the protest. Summary diligence may pass not only against the acceptor, but likewise against the drawer, and all the indorsees jointly and severally; and at the instance of any indorsee, though the bill was not protested in his name, upon his producing a receipt or letter from the protesting indorsee. This act is in force only for seven

years after 15th May 1772, and to the end of the then next session of parliament: consequently is not yet become a permanent part of the law of Scotland.

Law of Scotland.

20. As for the solemnities essential to deeds signed in a foreign country, when they come to receive execution in Scotland, it is a general rule, that no laws can be of authority beyond the dominions of the law-giver. Hence, in strictness, no deed, though perfected according to the law of the place where it is signed, can have effect in another country where different solemnities are required to a deed of that sort. But this rigour is so softened *ex comitate*, by the common consent of nations, that all personal obligations granted according to the law of that country where they are signed, are effectual every where; which obtains even in obligations to convey heritage. Conveyances themselves, of heritable subjects, must be perfected according to the law of the country where the heritage lies, and from which it cannot be removed.

Solemnities of deeds signed in a foreign country.

21. A writing, while the grantor keeps it under his own power or his doer's, has no force; it becomes obligatory, only after it is delivered to the grantee himself, or found in the hands of a third person. As to which last, the following rules are observed. A deed found in the hands of one who is doer both for the grantor and grantee, is presumed to have been put in in his hands as doer for the grantee. The presumption is also for delivery, if the deed appears in the hands of one who is a stranger to both. Where a deed is deposited in the hands of a third person, the terms of depositation may be proved by the oath of the depositary, unless where they are reduced into writing. A deed appearing in the custody of the grantee himself, is considered as his absolute right; in so much that the grantor is not allowed to prove that it was granted in trust, otherwise than by a written declaration signed by the trustee, or by his oath.

Delivery and depositation of deeds.

22. The following deeds are effectual without delivery. (1.) Writings containing a clause dispensing with the delivery: these are of the nature of revocable deeds, where the death of the grantor is equivalent to delivery, because after death there can be no revocation. (2.) Deeds in favour of children, even natural ones; for parents are the proper custodians or keepers of their children's writings. From a similar reason, post-nuptial settlements by the husband to the wife need no delivery. (3.) Rights which are not to take effect till the grantor's death, or even where he reserves an interest to himself during his life; for it is presumed he holds the custody of these, merely to secure to himself such reserved interest. (4.) Deeds that the grantor lay under an antecedent natural obligation to execute, *e. g.* rights granted to a cautioner for his relief. (5.) Mutual obligations, *e. g.* contracts; for every such deed, the moment it is executed, is a common evidence to all the parties contractors. Lastly, the publication of a writing by registration, is equivalent to delivery.

What deeds are effectual without delivery.

#### SECT. XV. Of Obligations and Contracts arising from consent, and of Accessory Obligations.

clxxv.

CONTRACTS consensual, *i. e.* which might, by the Consensual Roman law, be perfected by sole consent, without the contracts intervention either of things or of writing, are sale, permutation, location, society, and mandate. Where the subject of any of these contracts is heritable, writing

Law of  
Scotland.Law of  
Scotland.

ting is necessary.

2. Sale is a contract, by which one becomes obliged to give something to another, in consideration of a certain price in current money to be paid for it. Things consisting merely in hope, may be the subject of this contract, as the draught of a net. Commodities, where their importation or use is absolutely prohibited, cannot be the subject of sale; and even in run goods, no action lies against the vender for not delivery, if the buyer knew the goods were run.

3. Though this contract may be perfected before delivery of the subject, the property remains till then with the vender. See No clix. 9. Yet till delivery, the hazard of its deterioration falls on the purchaser, because he has all the profits arising from it after the sale. On the other hand, the subject itself perishes to the vender; (1.) If it should perish through his fault, or after his undue delay to deliver it. (2.) If a subject is sold as a fungible, and not as an individual, or *corpore*, e. g. a quantity of farm-wheat, sold without distinguishing the parcel to be delivered from the rest of the farm. (3.) The *periculum* lies on the vender till delivery, if he be obliged by a special article in the contract to deliver the subject at a certain place.

Location.

4. Location is that contract, where an hire is stipulated for the use of things, or for the service of persons. He who lets his work or the use of his property to hire, is the locator or lessor; and the other, the conductor or lessee. In the location of things, the lessor is obliged to deliver the subject, fitted to the use it was let for; and the lessee must preserve it carefully, put it to no other use, and, after that is over, restore it. Where a workman or artificer lets his labour, and if the work is either not performed according to contract, or if it be insufficient, even from mere unskilfulness, he is liable to his employer in damages; for he ought not, as an artificer, to have undertaken a work to which he was not equal. A servant hired for a certain term, is intitled to his full wages, though from sickness or other accident he should be disabled for a part of his time; but, if he die before the term, his wages are only due for the time he actually served. If a master dies, or without good reason turns off, before the term, a servant who eats in his house, the servant is intitled to his full wages, and to his maintenance till that term: and, on the other part, a servant who without ground deserts his service, forfeits his wages and maintenance, and is liable to his master in damages.

Society.

5. Society or copartnership is a contract, whereby the several partners agree concerning the communication of loss and gain arising from the subject of the contract. It is formed by the reciprocal choice that the partners make of one another; and so is not constituted in the case of co-heirs, or of several legatees in the same subject. A copartnership may be so constituted, that one of the partners shall, either from his sole right of property in the subject, or from his superior skill, be entitled to a certain share of the profits, without being subjected to any part of the loss; but a society, where one partner is to bear a certain proportion of loss, without being entitled to any share of the profits, is justly reprobated. All the partners are intitled to shares of profit and loss proportioned to their several stocks, where it is not otherwise covenanted.

6. As partners are united, from a *delectus personæ*,

in a kind of brotherhood, no partner can, without a special power contained in the contract, transfer any part of his share to another. All the partners are bound *in solidum* by the obligation of any one of them, if he subscribe by the *firm* or social name of the company; unless it be a deed that fails not under the common course of administration. The company effects are the company property of the society subjected to its debts; so that no partner can claim a division thereof, even after the society is dissolved, till these are paid: and, consequently, no creditor of a partner can, by diligence, carry to himself the property of any part of the common stock, in prejudice of a company-creditor: but he may, by arrestment, secure his debtor's share in the company's hands, to be made forthcoming to him at the close of the copartnership, in so far as it is not exhausted by the company debts.

7. Society being founded in the mutual confidence among the *socii*, is dissolved, not only by the renunciation, but by the death of any one of them, if he be not otherwise specially covenanted. A partner who renounces upon unfair views, or at a critical time, when his withdrawing may be fatal to the society, loses his partners from all their engagements to him, while he is bound to them for all the profits he shall make by his withdrawing, and for the loss arising thereby to the company. Not only natural, but civil death, e. g. arising from a sentence inflicting capital punishment, makes one incapable to perform the duties of a partner, and consequently dissolves the society. In both cases, of death and renunciation, the remaining partners may continue the copartnership, either expressly, by entering into a new contract; or tacitly, by carrying on their trade as formerly. Public trading companies are now every day constituted, with rules very different from those which either obtained in the Roman law, or at this day obtain in private societies. The proprietors or partners in these, though they may transfer their shares, cannot renounce; nor does their death dissolve the company, but the share of the deceased descends to his representative.

8. A joint trade is not a copartnership, but a momentary contract, where two or more persons agree to contribute a sum, to be employed in a particular course of trade, the produce whereof is to be divided among the adventurers, according to their several shares, after the voyage is finished. If, in a joint trade, that partner who is intrusted with the money for purchasing the goods, should, in place of paying them in cash, buy them upon credit, the furnisher who followed his faith alone in the sale, has no recourse against the other adventurers; he can only recover from them what of the buyer's share is yet in their hands. Where any one of the adventurers in a joint trade becomes bankrupt, the others are preferable to his creditors, upon the common stock, as long as it continues undivided, for their relief of all the engagements entered into by them on account of the adventure.

A joint  
trade.

9. Mandate is a contract, by which one employs another to manage any business for him; and by the Roman law, it must have been gratuitous. It may be constituted tacitly, by one's suffering another to act in a certain branch of his affairs, for a tract of time together, without challenge. The mandatory is at liberty not to accept of the mandate; and, as his powers

Mandate

are

are solely founded in the mandant's commission, he must, if he undertakes it, strictly adhere to the directions given him : Nor is it a good defence, that the method he followed was more rational ; for in that his employer was the proper judge. Where no special rules are prescribed, the mandatory, if he acts prudently, is secure, whatever the success may be ; and he can sue for the recovery of all the expences reasonably deburred by him in the execution of his office.

10. Mandates may be general, containing a power of administering the mandant's whole affairs ; but no mandate implies a power of disposing gratuitously of the constituent's property, nor even of selling his heritage for an adequate price : but a general mandatory may sell such of the moveables as must otherwise perish. No mandatory can, without special powers, transact doubtful claims belonging to his constituent, or refer them to arbiters.

11. Mandates expire, (1.) By the revocation of the employer, though only tacit, as if he should name another mandatory for the same business. (2.) By the renunciation of the mandatory ; even after he has executed part of his commission, if his office be gratuitous. (3.) By the death, either of the mandant or mandatory : But if matters are not entire, the mandate continues in force, notwithstanding such revocation, renunciation, or death. Procurators of resignation, and precepts of seisin, are made out in the form of mandates ; but, because they are granted for the sole benefit of the mandatory, all of them, excepting precepts of *clare constat*, are declared to continue after the death either of the grantor or grantee. Deeds which contain a clause or mandate for registration, are for the same reason made registrable after the death of either.

12. The favour of commerce has introduced a tacit mandate, by which masters of ships are empowered to contract in name of their executors or employers, for repairs, ship-provisions, and whatever else may be necessary for the ship or crew ; so as to oblige not themselves only, but their employers. Whoever has the actual charge of the ship is deemed the master, though he should have no commission from the executors, or should be substituted by the master in the direction of the ship without their knowledge. Executors are liable, whether the master has paid his own money to a merchant for necessities, or has borrowed money to purchase them. The furnisher or lender must prove that the ship needed repairs, provisions, &c. to such an extent ; but he is under no necessity to prove the application of the money or materials to the ship's use. If there are several executors, they are liable *singuli in solidum*. In the same manner the undertaker of any branch of trade, manufacture, or other land negotiation, is bound by the contracts of the insurers whom he sets over it, in so far as relates to the subject of the *propositura*.

13. Contracts and obligations, in themselves imperfect, receive strength by the contractor or his heirs doing any act thereafter which imports an approbation of them, and consequently supplies the want of an original legal consent. This is called *homologation* ; and it takes place even in deeds intrinsically null, whether the nullity arises from the want of statutory solemnities, or from the incapacity of the grantor. It cannot be inferred, (1.) By the act of a person who was not in the

knowledge of the original deed ; for one cannot approve what he is ignorant of. (2.) Homologation has no place where the act or deed, which is pleaded as such, can be ascribed to any other cause ; for an intention to come under an obligation is not presumed.

14. Quasi-contracts are formed without explicit consent, by one of the parties doing something that by its nature either obliges him to the other party, or the other party to him. Under this class may be reckoned tutory, &c. the entry of an heir, *negotiorum gestio, indebiti solutio*, communion of goods between two or more common proprietors, and *mercium jactus levandæ navis causa*. *Negotiorum gestio* forms those obligations which arise from the management of a person's affairs, in his absence, by another, without a mandate. As such manager acts without authority from the proprietor, he ought to be liable in exact diligence, unless he has from friendship interposed in affairs which admitted no delay ; and he is accountable for his intromissions with interest. On the other party, he is intitled to the recovery of his necessary deburements on the subject, and to be relieved of the obligations in which he may have bound himself in consequence of the management.

15. *Indebiti solutio*, or the payment to one of what is not due to him, if made through any mistake, either of fact, or even of law, bounds him who made the payment in an action against the receiver for repayment (*condictio indebiti*.) This action does not lie, (1.) If the sum paid was due *ex æquitate*, or by a natural obligation : for the obligation to restore is founded solely in equity. (2.) If he who made the payment knew that nothing was due ; for *qui consulto dat quod non debebat, presumitur donare*.

16. Where two or more persons become common proprietors of the same subject, either by legacy, gift, or purchase, without the view of co-partnership, an obligation is thereby created among the proprietors to communicate the profit and loss arising from the subject, while it remains common : And the subject may be divided at the suit of any having interest. This division, where the question is among the common proprietors, is according to the valuation of their respective properties : But, where the question is between the proprietors and those having servitudes upon the property, the superficies is only divided, without prejudice to the property. Commonities belonging to the king, or to royal boroughs, are not divisible. Lands lying runrig, and belonging to different proprietors, may be divided, with the exception of borough and incorporated acres ; the execution of which is committed to the judge-ordinary, or justices of the peace.

17. The throwing of goods overboard, for lightening a ship in a storm, creates an obligation, whereby the owners of the ship and goods saved are obliged to contribute for the relief of those whose goods were thrown overboard, that so all may bear a proportional loss of the goods ejected for the common safety. In this contribution, the ship's provisions suffer no estimation. A master who has cut his mast, or parted with his anchor, to save the ship, is intitled to this relief ; but if he has lost them by the storm, the loss falls only on the ship and freight. If the ejection does not save the ship, the goods preserved from shipwreck are not liable in contribution. Ejection may be lawfully made, if the master and a third part of the mariners

de jactu.

Law of  
Scotland.

judge that measure necessary, though the owner of the goods should oppose it: and the goods ejected are to be valued at the price that the goods of the same sort which are saved shall be afterwards sold for.

Accessory  
obligations.

18. There are certain obligations which cannot subsist by themselves, but are accessions to, or make a part of, other obligations. Of this sort are fidejussion, and the obligation to pay interest. Cautionry, or fidejussion, is that obligation by which one becomes engaged as security for another, that he shall either pay a sum, or perform a deed.

Cautionry.

19. A cautioner for a sum of money may be bound, either simply as cautioner for the principal debtor, or conjunctly and severally for and with the principal debtor. The first has, by our customs, the *beneficium ordinis*, or of discussion; by which the creditor is obliged to discuss the proper debtor, before he can insist for payment against the cautioner. Where one is bound as full debtor with and for the principal, or conjunctly and severally with him, the two obligants are bound equally in the same obligation, each in *solidum*; and consequently, the cautioner, though he is but an accessory, may be sued for the whole, without either discussing or even citing the principal debtor. Cautioners for performance of facts by another, or for the faithful discharge of an office, (*e. g.* for factors, tutors, &c.) cannot by the nature of their engagement be bound conjunctly and severally with the principal obligant, because the fact to which the principal is bound cannot possibly be performed by any other. In such engagements, therefore, the failure must be previously constituted against the proper debtor, before action can be brought against the cautioner for making up the loss of the party suffering.

20. The cautioner, who binds himself at the desire of the principal debtor, has an *actio mandati* or of relief against him, for recovering the principal and interest paid by himself to the creditor, and for necessary damages; which action lies *de jure*, though the creditor should not assign to him on payment. As relief against the debtor is implied in fidejussory obligations, the cautioner, where such relief is cut off, is no longer bound: hence, the defence of prescription frees the cautioner, as well as the principal debtor.

21. But, (1.) Where the cautionary is interposed to an obligation merely natural, the relief is restricted to the sums that have really turned to the debtor's profit. (2.) A cautioner who pays without citing the debtor, loses his relief, in so far as the debtor had a relevant defence against the debt, in whole or in part. Relief is not competent to the cautioner, till he either pays the debt, or is distressed for it; except, 1st, Where the debtor is expressly bound to deliver to the cautioner his obligation cancelled, against a day certain, and has failed: or, 2dly, Where the debtor is *vergens ad inopiam*; in which case the cautioner may, by proper diligence, secure the debtor's funds for his own relief, even before payment or distress.

22. A right of relief is competent *de jure* to the cautioner who pays against his co-cautioners, unless where the cautioner appears to have renounced it. In consequence of this implied relief, a creditor, if he shall grant a discharge to any one of the cautioners, must, in demanding the debt from the others, deduct that part as to which he has cut off their relief by that dis-

charge. Where a cautioner in a bond signs a bond of corroboration, as a principal obligant with the proper debtor, and with them a new cautioner, the cautioner in the new bond is intitled to a total relief against the first cautioner, at whose desire he is presumed to be bound.

23. Cautionry is also judicial, as in a suspension. It is sufficient to loose the cautioner, that when he became bound, the suspender had good reason to suspend, *e. g.* if the charger had at that period no title, or had not then performed his part, tho' these grounds of suspension should be afterwards taken off. In all maritime causes, where the parties are frequently foreigners, the defender must give caution *judicio sibi et judicatum solvi*: such cautioner gets free by the death of the defender before sentence; but he continues bound, tho' the cause should be carried from the admiral to the court of session. This sort of caution is only to be exacted in causes strictly maritime.

24. It happens frequently, that a creditor takes two or more obligants bound to him, all as principal debtors, without fidejussion. Where they are so bound, for the performance of facts that are in themselves indivisible, they are liable each for the whole, or *singuli in solidum*. But, if the obligation be for a sum of money, they are only liable *pro rata*; unless, (1.) Where they are in express words bound conjunctly and severally; or, (2.) In the case of bills or promissory notes. One of several obligants of this sort, who pays the whole debt, or fulfils the obligation, is intitled to a proportional relief against the rest; in such manner, that the loss must, in every case, fall equally upon all the solvent obligants.

25. Obligations for sums of money are frequently accompanied with an obligation for the annual or interest thereof. Interest (*usura*) is the profit due by the debtor of a sum of money to the creditor, for the use of it. The canon law considered the taking of interest as unlawful: the law of Moses allowed it to be exacted from strangers: and all the reformed nations of Europe have found it necessary, after the example of the Romans, to authorise it at certain rates fixed by statute. Soon after the reformation, our legal interest was fixed at the rate of ten per cent. *per annum*; from which time, it has been gradually reduced, till at last, by 12 *Ann. stat. 2. c. 16*, it was brought to five per cent. and has continued at that rate ever since.

26. Interest is due, either by law, or by passion. It is due by law, either from the force of statute, under which may be included acts of sederunt, or from the nature of the transaction. Bills of exchange, and inland bills, though they should not be protested, carry interest from their date in case of not acceptance; or from the day of their falling due, in case of acceptance and not payment. Where a bill is accepted, which bears no term of payment, or which is payable on demand, no interest is due till demand be made of the sum, the legal voucher of which is a notarial protest. Interest is due by a debtor after denunciation, for all the sums contained in the diligence, even for that part which is made up of interest. Sums paid by cautioners on distress, carry interest, not only as to the principal sum in the obligation, but as to the interest paid by the cautioner. Factors named by the court of session

Law of  
Scotland.

Judicial  
cautionry.

Interest of  
money.

are liable for interest, by a special act of sederunt; see No clxxii. 1.

27. It arises *ex lege*, or from the nature of the transaction, that a purchaser in a sale is liable in interest for the price of the lands bought from the term of his entry, though the price should be arrested in his hands, or though the seller should not be able to deliver to him a sufficient progress or title to the lands; for no purchaser can in equity enjoy the fruits of the lands, while at the same time he retains the interest of the price: but lawful confiscation of the price made by a purchaser, upon the refusal of the persons having right to receive it, stops the currency of interest. Where one intermeddles with money belonging to another which carries interest, he ought to restore it *cum omni eversione et causa*; and is therefore liable in the interest of it, as being truly an accessory of the subject itself. It is also from the nature of the transaction, that interest is in certain cases allowed to merchants or others in name of damages.

28. Interest is due by express paction, where there is a clause in a bond or obligation, by which money is made to carry interest. An obligation is not lawful, where it is agreed on, that the yearly interest of the sum lent, if it should not be paid punctually as it falls due, shall be accumulated into a principal sum bearing interest; but an obligation may be lawfully granted, not only for the sum truly lent, but for the interest to the day at which the obligation is made payable, whereby the intermediate interest is accumulated into a principal sum from the term of payment. Interest may be also due by implied paction: Thus, where interest upon a debt is by a letter promised for time past, such promise implies a paction for interest as long as the debt remains unpaid; thus also, the use of payment of interest precludes a paction, and when interest is expressed for one term, it is presumed to be bargained for till payment.

29. The subject-matter of all obligations consists either of things, or of facts. Things exempted from commerce cannot be the subject of obligation. See No clxxii. 2. One cannot be obliged to the performance of a fact naturally impossible; nor of a fact in itself immoral, for that is also in the judgment of law impossible. Since impossible obligations are null, no penalty or damage can be incurred for non-performance: but it is otherwise, if the fact be in itself possible, though not in the debtor's power; in which case the rule obtains, *locum facti impræstabilis subit damnum et interesse*.

30. An obligation, to which a condition is adjoined, either naturally or morally impossible, is in the general case null; for the parties are presumed not to have been serious. But such obligation is valid, and the condition thereof held *pro non scripta*, (1.) In testaments; (2.) In obligations, to the performance of which the granter lies under a natural tie, as in bonds of provision to a child. Where an obligation is granted under a condition, lawful but unfavourable, e. g. that the creditor shall not marry without the consent of certain friends, no more weight is given to the condition than the judge thinks reasonable. A condition, which is in some degree in the power of the creditor himself, is held as fulfilled, if he has done all he could to fulfil it. Implement or performance cannot be de-

manded in a mutual contract, by that party who himself declines or cannot fulfil the counterpart.

31. Donation, so long as the subject is not delivered to the donee, may be justly ranked among obligations; and it is that obligation which arises from the mere good-will and liberality of the granter. Donations imply no warrandice, but from the future facts of the donor. They are hardly revokable by our law for ingratitude, though it should be of the grossest kind: those betwixt man and wife are revokable by the donor, even after the death of the donee; but remuneratory grants, not being truly donations, cannot be so revoked. That special sort of donation, which is constituted verbally, is called a *promissio*. The Roman law intitled all donors to the *beneficium competentie*, in virtue of which they might retain such part of the donation as was necessary for their own subsistence. Our law allows this benefit to fathers, with respect to the provisions granted to their children; and to grandfathers, which is a natural consequence of children's obligation to aliment their indigent parents; but to no collateral relation, not even to brothers.

32. Donations, made in contemplation of death, or *mortis causa*, are of the nature of legacies, and like them revokable: consequently, not being effectual in the granter's life, they cannot compete with any of his creditors; not even with those whose debts were contracted after the donation. They are understood to be given from a personal regard to the donee, and therefore fall by his predecease. No deed, after delivery, is to be presumed a *donatio mortis causa*; for revocation is excluded by delivery.

33. Deeds are not presumed, *in dubio*, to be donations. Hence, a deed by a debtor to his creditor, if donation be not expressed, is presumed to be granted in security or satisfaction of the debt; but bonds of provision to children are, from the presumption of paternal affection, construed to be intended as an additional patrimony: yet a tocher, given to a daughter in her marriage-contract, is presumed to be in satisfaction of all former bonds and debts; because marriage-contracts usually contain the whole provisions in favour of the bride. One who alimments a person that is come of age, without an express paction for board, is presumed to have entertained him as a friend, unless in the case of those who earn their living by the entertainment or board of strangers. But alimony given to minors, who cannot bargain for themselves is not accounted a donation; except either where it is presumed, from the near relation of the person alimmenting, that it was given *ex pietate*; or where the minor had a father or curators, with whom a bargain might have been made.

#### SECT. XVI. Of the Dissolution or Extinction of Obligations.

clxxvi.

OBLIGATIONS may be dissolved by performance or implement, consent, compensation, novation, and confusion. (1.) By special performance: thus, an obligation for a sum of money is extinguished by payment. The creditor is not obliged to accept of payment by parts, unless where the sum is payable by different divisions. If a debtor in two or more separate bonds to the same creditor, made an indefinite payment, without ascribing it, at the time, to any one of the

Extinction of obligations; as performance.

Donation.

Law of  
Scotland.

the obligations, the payment is applied, 1st, To interest, or to sums not bearing interest. 2dly, To the sums that are least secured, if the debtor thereby incurs no rigorous penalty. But, 3dly, If this application be penal on the debtor, *c. p.* by suffering the legal of an adjudication to expire, the payment will be so applied to as to save the debtor from that forfeiture. Where one of the debts is secured by a cautioner, the other not, the application is to be so made, *ceteris paribus*, that both creditor and cautioner may have equal justice done to them.

2. Payment made by the debtor upon a mistake in fact, to one whom he believed, upon probable grounds, to have the right of receiving payment; extinguishes the obligation. But payment made to one, to whom the law denies the power of receiving it, has not this effect; as if a debtor, seized by letters of caption, should make payment to the messenger; for *ignorantia juris neminem excusat*. In all debts, the debtor, if he be not interpellated, may safely pay before the term, except in tack-duties or feu-duties; the payment whereof, before the terms at which they are made payable, is construed to be collusive, in a question with a creditor of the landlord or superior. Payment is *in dubio* presumed, by the voucher of the debt being in the hands of the debtor; *chirographum, apud debitorem repertum, præsumitur solutum*.

By consent.

3. Obligations are extinguishable by the consent of the creditor, who, without full implement, or even any implement, may renounce the right constituted in his own favour. Though a discharge or acquittance, granted by one whom the debtor *bona fide* took for the creditor, but who was not, extinguishes the obligation, if the satisfaction made by the debtor was real; yet where it is imaginary, the discharge will not screen him from paying to the true creditor the debt that he had made no prior satisfaction for. In all debts which are constituted by writing, the extinction, whether it be by specific performance, or bare consent, must be proved, either by the oath of the creditor, or by a discharge in writing; and the same solemnities which law requires in the obligation, are necessary in the discharge: but, where payment is made, not by the debtor himself, but by the creditor's intromission with the rents of the debtor's estate, or by delivery to him of goods in name of the debtor, such delivery or intromission, being *facti*, may be proved by witnesses, though the debt should have been not only constituted by writing, but made real on the debtor's lands by adjudication.

4. A discharge, though it should be general, of all that the granter can demand, extends not to debts of an uncommon kind, which are not presumed to have been under the granter's eye. This doctrine applies also to general assignments. In annual payments, as of rents, feu-duties, interest, &c. three consecutive discharges by the creditor, of the yearly or termly duties, presume the payment of all precedings. Two discharges by the ancestor, and the third by the heir, do not infer this presumption, if the heir was ignorant of the ancestor's discharges. And discharges by an administrator, as a factor, tutor, &c. presume only the payment of all preceding duties incurred during his administration. This presumption arises from repeating the discharges thrice successively; and so does not hold in the case of two discharges, though they should include

the duties of three or more terms.

5. Where the same person is both creditor and debtor to another, the mutual obligations, if they are for equal sums, are extinguished by compensation; if for unequal, still the lesser obligation is extinguished, and the greater diminished, as far as the concurrence of debt and credit goes. To found compensation, (1.) Each of the parties must be debtor and creditor at the same time. (2.) Each of them must be debtor and creditor in his own right. (3.) The mutual debts must be of the same quality: hence, a sum of money cannot be compensated with a quantity of corns; because, till the prices are fixed, at which the corns are to be converted into money, the two debts are incommensurable. Lastly, compensation cannot be admitted, where the mutual debts are not clearly ascertained, either by a written obligation, the sentence of a judge, or the oath of the party. Where this requires but a short discussion, sentence for the pursuer is delayed for some time, *ex equitate*, that the defender may make good his ground of compensation. Where a debt for fungibles is ascertained in money, by the sentence of a judge, the compensation can have no effect farther back than the liquidation; because, before sentence, the debts were incommensurable: but, where a debt for a sum of money is, in the course of a suit, constituted by the oath of the debtor, the compensation, after it is admitted by the judge, operates, *retro*, in so far as concerns the currency of interest, to the time that, by the parties acknowledgment, the debt became due: for, in this case, the debtor's oath is not what creates the debt, or makes it liquid; it only declares that such a liquid sum was truly due before. Compensation cannot be offered after decree, either by way of suspension or reduction; unless it has been formerly pleaded, and unjustly repelled. Decrees in absence are excepted.

6. The right of retention, which bears a near resemblance to compensation, is chiefly competent, where the mutual debts, not being liquid, cannot be the ground of compensation; and it is sometimes admitted *ex equitate*, in liquid debts, where compensation is excluded by statute: thus, though compensation cannot be pleaded after decree, either against a creditor or his assignee; yet, if the original creditor should become bankrupt, the debtor, even after decree, may retain against the assignee, till he gives security for satisfying the debtor's claim against the cedent. This right is frequently founded in the expence debursed or work employed on the subject retained, and so arises from the mutual obligations incumbent on the parties. But retention may be sustained, though the debt due to him who claims it does not arise from the nature of the obligation by which he is debtor: thus, a factor on a land-estate may retain the sums levied by him in consequence of his factory, not only till he be paid of the disbursements made on occasion of such estate, but also till he be discharged from the separate engagements he may have entered into on his constituent's account.

7. Obligations are dissolved by novation, whereby one obligation is changed into another, without changing either the debtor or creditor. The first obligation being thereby extinguished, the cautioners in it are loosed, and all its consequences discharged; so that the debtor remains bound only by the last. As a creditor to whom a right is once constituted, ought not to lose it

it by implication, novation is not easily presumed, and the new obligation is construed to be merely corroborative of the old; but, where the second obligation expressly bears to be in *satisfaction* of the first, these words must necessarily be explained into novation. Where the creditor accepts of a new debtor, in place of the former who is discharged, this method of extinction is called *delegation*.

8. Obligations are extinguished *confusione*, where the debt and credit meet in the same person, either by succession or singular title, *e. g.* when the debtor succeeds to the creditor, or the creditor to the debtor, or a stranger to both; for one cannot be debtor to himself. If the succession, from which the *confusio* arises, happens afterwards to be divided, so as the debtor and creditor come again to be different persons; the *confusio* does not produce an extinction, but only a temporary suspension, of the debt.

## SECT. XVII. Of Assignations.

HERITABLE rights, when they are clothed with investiture, are transmitted by disposition, which is a writing containing procuratory of resignation and precept of seisin; but those which either require no seisin, or on which seisin has not actually followed, are transmissible by simple assignation. He who grants the assignation, is called the cedent; and he who receives it, the assignee or assignee: if the assignee conveys his right to a third person, it is called a transmutation; and if he assigns it back to the cedent, a retrocession. Certain rights are, from the uses to which they are destined, incapable of transmission, as alimentary rights: others cannot be assigned by the person invested in them, without special powers given to him; as tacks, reversions; the transmission of a third fort, is not presumed to be intended, without an express conveyance; as of paraphernal goods, which are so proper to the wife, that a general assignation, by her to her husband, of all that did or should belong to her at her decease, does not comprehend them. A life-rent-right is, by its nature, incapable of a proper transmission; but its profits may be assigned, while it subsists.

2. Assignations must not only be delivered to the assignee, but intimated by him to the debtor. Intimations are considered as so necessary for completing the conveyance, that in a competition between two assignations, the last, if first intimated, is preferred.

3. Though, regularly, intimation to the debtor is made by an instrument, taken in the hands of a notary, by the assignee or his procurator; yet the law admits equipollencies, where the notice of the assignment given to the debtor is equally strong. Thus, a charge upon letters of horning at the assignee's instance, or a suit brought by him against the debtor, supplies the want of intimation; these being judicial acts, which expose the conveyance to the eyes both of the judge and of the debtor; or the debtor's promise of payment by writing to the assignee, because that is in effect a corroborating of the original debt. The assignee's possession of the right, by entering into payment of the rents or interest, is also equal to an intimation; for it imports, not only notice to the debtor, but his actual compliance: but the debtor's private knowledge of the assignment is not sustained as intimation.

4. Certain conveyances need no intimation. (1.) In-

dorsements of bills of exchange; for these are not to be fettered with forms, introduced by the laws of particular states. (2.) Bank-notes are fully conveyed by the bare delivery of them; for as they are payable to the bearer, their property must pass with their possession. (3.) Adjudication, which is a judicial conveyance; and marriage, which is a legal one; carry the full right of the subjects thereby conveyed, without intimation: nevertheless, as there is nothing in these conveyances which can of themselves put the debtor in *mala fide*, he is therefore *in tuto* to pay to the wife, or to the original creditor in the debt adjudged, till the marriage or adjudication be notified to him. Assignments of moveable subjects, though they be intimated, if they are made *retenta possessione*, (the cedent retaining the possession), cannot hurt the cedent's creditors; for such rights are presumed, in all questions with creditors, to be collusive, and granted in trust for the cedent himself.

5. An assignation carries to the assignee the whole right of the subject conveyed, as it was in the cedent; and consequently, he may use diligence, either in his cedent's name while he is alive, or in his own.

6. After an assignation is intimated, the debtor cannot prove a payment, or compensation, by the oath of the cedent, who has no longer any interest in the debt; unless the matter has been made litigious by an action commenced prior to the intimation: but the debtor may refer to the oath of the assignee, who is in the right of the debt, that the assignment was gratuitous, or in trust for the cedent; either of which being proved, the oath of the cedent will affect the assignee. If the assignation be in part onerous, and in part gratuitous, the cedent's oath is good against the assignee, only in so far as his right is gratuitous. All defences competent against the original creditor in a moveable debt, which can be proved otherwise than by his oath, continue relevant against even an onerous assignee; whose right can be no better than that of his author, and must therefore remain affected with all the burdens which attended it in the author's person.

## SECT. XVIII. Of Arrestments and Poindings.

clxxviii.

THE diligences, whereby a creditor may affect his debtor's moveable subjects, are arrestment and pouding. By arrestment is sometimes meant the securing of a criminal's person till trial; but as it is understood in the rubric of this title, it is the order of a judge, by which he who is debtor in a moveable obligation to the arrester's debtor, is prohibited to make payment or delivery till the debt due to the arrester be paid or secured. The arrester's debtor is usually called the common debtor; because, where there are two or more competing creditors, he is debtor to all of them. The person in whose hands the diligence is used, is styled the arrester.

2. Arrestment may be laid on by the authority either of the supreme court, or of an inferior judge. In the first case, it proceeds either upon special letters of arrestment, or on a warrant contained in letters of horning; and it must be executed by a messenger. The warrants granted by inferior judges are called precepts of arrestment, and they are executed by the officer proper to the court. Where the debtor to the common debtor is a pupil, arrestment is properly used in the hands

Arrestment

Law of  
Scotland.

Law of  
Scotland.

hands of the tutor, as the pupil's administrator: this doctrine may perhaps extend to other general administrators, as commissioner, &c. But arrestment, used in the hands of a factor or steward, cannot found an action of forthcoming without calling the constituent. Where the debtor to the common debtor is a corporation, arrestment must be used in the hands of the directors or treasurer, who represent the whole body. Arrestment, when it is used in the hands of the debtor himself, is inept; for that diligence is intended only as a restraint upon third parties.

3. All debts, in which one is personally bound, though they should be heritably secured, are grounds upon which the creditor may arrest the moveable estate belonging to his debtor. Arrestment may proceed on a debt, the term of payment whereof is not yet come, in case the debtor be *vergens ad inopiam*. If a debt be not yet constituted by decree or registration, the creditor may raise and execute a summons against his debtor for payment, on which pending action arrestment may be used, in the same manner as inhibition, which is called *arrestment upon a dependence*. If one's ground of credit be for the performance of a fact, or if his depending process be merely declaratory, without a conclusion of payment or delivery, such claims are not admitted to be sufficient grounds for arrestment.

What debts  
arrestable.

4. Moveable debts are the proper subject of arrestment; under which are comprehended conditional debts, and even depending claims. For lessening the expence of diligence to creditors, all bonds which have not been made properly heritable by seisin are declared arrestable: but this does not extend to adjudications, wadsets, or other personal rights of lands, which are not properly debts. Certain moveable debts are not arrestable. (1.) Debts due by bill, which pass from hand to hand as bags of money. (2.) Future debts; for though inhibition extends to *adquirenda* as well as *acquisita*, yet arrestment is limited, by its warrant, to the debt due at the time of serving it against the arrestee. Hence, an arrestment of rents or interest carries only those that have already either fallen due, or at least become current. Claims, depending on the issue of a suit, are not considered as future debts; for the sentence, when pronounced, has a retrospect to the period at which the claim was first founded. The like doctrine holds in conditional debts. (3.) Alimentary debts are not arrestable; for these are granted on personal considerations, and so are not communicable to creditors: but the past interest due upon such debt may be arrested by the person who has furnished the alimony. One cannot secure his own effects to himself for his maintenance, so as they shall not be affectable by his creditors. Salaries annexed to offices granted by the king, and particularly those granted to the judges of the Session, and the fees of servants, are considered as alimentary funds; but the surplus fee, over and above what is necessary for the servant's personal uses, may be arrested.

Effect of  
breach of  
arrestment.

5. If, in contempt of the arrestment, the arrestee shall make payment of the sum, or deliver the goods arrested, to the common debtor, he is not only liable criminally for breach of arrestment, but he must pay the debt again to the arrester. Arrestment is not merely prohibitory, as inhibitions are; but is a step of diligence which founds the user in a subsequent ac-

tion, whereby the property of the subject arrested may be adjudged to him. It therefore does not, by our latter practice, fall by the death of the arrestee; but continues to subsist, as a foundation for an action of forthcoming against his heir, while the subject arrested remains *in medio*. Far less is arrestment lost, either by the death of the arrester, or of the common debtor.

Loosing of  
arrestment.

6. Where arrestment proceeds on a depending action, it may be loosed by the common debtor's giving security to the arrester for his debt in the event it shall be found due. Arrestment founded on decrees, or on registered obligations, which in the judgment of law are decrees, cannot be loosed but upon payment or confiscation; except, (1.) Where the term of payment of the debt is not yet come, or the condition has not yet existed. (2.) Where the arrestment has proceeded on a registered contract, in which the debts or mutual obligations are not liquid. (3.) Where the decree is suspended, or turned into a libel; for, till the suspension be discussed, or the pending action concluded, it cannot be known whether any debt be truly due. A loosing takes off the *nexus* which had been laid on the subject arrested; so that the arrestee may thereafter pay safely to his creditor, and the cautioner is substituted in place of the arrestment, for the arrester's security: yet the arrester may, while the subject continues with the arrestee, pursue him in a forthcoming, notwithstanding the loosing.

Forthcoming  
on arrestment.

7. Arrestment is only an inchoate or begun diligence; to perfect it, there must be an action brought by the arrester against the arrestee, to make the debt or subject arrested forthcoming. In this action, the common debtor must be called for his interest, that he may have an opportunity of excepting to the lawfulness or extent of the debt on which the diligence proceeded. Before a forthcoming can be pursued, the debt due by the common debtor to the arrester must be liquidated; for the arrester can be no further intitled to the subject arrested than to the extent of the debt due to him by the common debtor. Where the subject arrested is a sum of money, it is, by the decree of forthcoming, directed to be paid to the pursuer towards satisfying his debt; where goods are arrested, the judge ordains them to be exposed to sale, and the price to be delivered to the pursuer. So that, in either case, decrees of forthcoming are judicial assignations to the arrester of the subject arrested.

8. In all competitions, regard is had to the dates, Preference not of the grounds of debt, but of the diligences proceeding upon them. In the competition of arrestments, the preference is governed by their dates, according to the priority even of hours, where it appears with any certainty which is the first. But, as arrestment is but a begun diligence, therefore if a prior arrester shall neglect to insist in an action of forthcoming for such a time as may be reasonably construed into a desertion of his begun diligence, he loses his preference. But, as dereliction of diligence is not easily presumed, the distance of above two years, between the first arrestment and the decree of forthcoming, was found not to make such a *mora* as to intitle the posterior arrester to a preference. This rule of preference, according to the dates of the several arrestments, holds, by our present practice, whether they have proceeded on a decree, or

or

law of  
Scotland.

Law of  
Scotland.

on a dependence; on debts not yet payable, or on debts already payable; provided the pendency shall have been closed, or the debt have become payable, before the issue of the competition.

Powers of  
messengers  
in poid-  
ing.

9. In the competition of arrestments with assignations, an assignation by the common debtor, intimated before arrestment, is preferable to the arrestment. If the assignation is granted before arrestment, but not intimated till after it, the arrester is preferred.

10. Poiding is that diligence affecting moveable subjects, by which their property is carried directly to the creditor. No poiding can proceed, till a charge be given to the debtor to pay or perform, and the days thereof be expired, except poidings against vassals for their feu-duties, and poidings against tenants for rent, proceeding upon the landlord's own decree; in which the ancient custom of poiding without a previous charge continues. A debtor's goods may be poided by one creditor, though they have been arrested before by another; for arrestment being but an imperfect diligence, leaves the right of the subject still in the debtor, and so cannot hinder any creditor from using a more perfect diligence, which has the effect of carrying the property directly to himself.

11. No cattle pertaining to the plough, nor instruments of tillage, can be poided in the time of labouring or tilling the ground, unless where the debtor has no other goods. By labouring-time is understood, that time, in which that tenant, whose goods are to be poided, is ploughing, though he should have been earlier or later than his neighbours; but summer fallowing does not fall under this rule.

12. In the execution of poiding, the debtor's goods must be apprifed, first on the ground of the lands where they are laid hold on, and a second time at the market-crofs of the jurisdiction, by the stated apprifers thereof; or, if there be none, by persons named by the messenger or other officer employed in the diligence. Next, the messenger must, after public intimation by three oyeses, declare the value of the goods according to the second apprifement, and require the debtor to make payment of the debt, including interest and expences. If payment shall be offered to the creditor, or in his absence to his lawful attorney; or if, in case of refusal by them, confiscation of the debt shall be made in the hands of the judge-ordinary or his clerk, the goods must be left with the debtor; if not, the messenger ought to adjudge and deliver them over, at the apprifed value, to the user of the diligence towards his payment: and the debtor is intitled to a copy of the warrant and executions, as a voucher that the debt is discharged in whole or in part by the goods poided.

13. Ministers may poid for their stipends, upon one apprifement on the ground of the lands; and landlords were always in use to poid so, for their rents. Apprifement of the goods at the market-crofs of the next royal borough, or even of the next head-borough of stewartry or regality, though these jurisdictions be abolished, is declared as sufficient as if they were carried to the head-borough of the shire. Poiding, whether it be considered as a sentence, or as the execution of a sentence, must be proceeded in between sun-rising and sun-setting; or at least it must be finished before

the going off of day-light. The powers of the officer employed in the execution of poidings, are not clearly defined by custom, in the case of a third party claiming the property of the goods to be poided. This is certain, that he may take the oath of the claimant, upon the verity of his claim; and if from thence it shall appear that the claimant's title is collusive, he ought to proceed in the diligence; but, if there remains the least doubt, his safest course is to deliver the goods to the claimant, and to express in his execution the reasons why poiding did not proceed.

14. Any person who stops a poiding *via facti*, on groundless pretences, is liable, both criminally, in the pains of deforcement, (see No cxxxvi. 15.) and civilly, in the value of the goods which might have been poided by the creditor.

15. By 12<sup>th</sup> Geo. III. c. 72. the creditor upon whose diligence a debtor is rendered bankrupt, or the debtor himself, if he finds his circumstances failing, may apply to the court of session for a sequestration of his personal estate for behoof of all his creditors; and have it vested either in a factor named by the court, or in a factor or trustees named by the creditors. All arrestments or poidings of the debtor's effects executed within 30 days prior to the sequestration are ineffectual. This act is temporary.

### SECT. XIX. Of Prescriptions.

clxxxix.

PREScription, which is a method, both of establishing and of extinguishing property, is either positive or negative. Positive prescription is generally defined, as the Roman *usucapio*. The acquisition of property (it should rather be, when applied to our law, the securing it against all further challenge) by the possessor's continuing his possession for the time which law has declared sufficient for that purpose: negative, is the loss or amission of a right, by neglecting to follow it forth, or use it, during the whole time limited by law. The doctrine of prescription, which is, by some writers, condemned as contrary to justice, has been introduced, that the claims of negligent creditors might not subside for ever, that property might be at last fixed, and forgeries discouraged, which the difficulty of detecting must have made exceeding frequent, if no length of time had limited the legal effect of writings.

2. Positive prescription was first introduced into our law by 1617, c. 12. which enacts, that whoever shall have possessed his lands, annuallents, or other heritages, peaceably, in virtue of infeftments, for 40 years continually after their dates, shall not thereafter be disquieted in his right by any person pretending a better title. Under heritages are comprehended every right that is *fundo annexum*, and capable of continual possession. Continued possession, if proved as far back as the memory of man, presumes possession upwards to the date of the infeftment. The whole course of possession must by the act be founded on seifins; and consequently no part thereof on the bare right of apparenry: but 40 years possession, without seifin, is sufficient in the prescription of such heritable rights as do not require seifin. The possession must also be without any *lawful* interruption, *i. e.* it must neither be interrupted *via facti*, nor *via juris*. The prescription of subjects not expressed in the infeftment as part and pertinent of another

Law of  
Scotland.

other subject specially expressed, has been explained, No clxvii. 6.

3. The act requires, that the possessor produce, as his title of prescription, a charter of the lands, preceding the 40 years possession, with the feisin following on it: and where there is no charter extant, feisins, one or more, standing together for 40 years, and proceeding either on retours or precepts of *clare constat*. This has given rise to a reasonable distinction observed in practice, between the prescription of a singular successor, and of an heir. Singular successors must produce for their title of prescription, not only a feisin, but its warrant, as a charter, disposition, &c. either in their own person, or in that of their author: but the production, by an heir, of feisins, one or more, standing together for 40 years, and proceeding on retours or precepts of *clare constat*, is sufficient. The heir is not obliged to produce the retours or precepts on which his feisins proceed, nor is the singular successor obliged to produce the ground of his charter; so that if the title of prescription produced be a fair deed, and a sufficient title of property, the possessor is secure by the act, which admits no ground of challenge, but falsehood. A special statute, for establishing the positive prescription in moveable rights, was not necessary; for, since a title in writing is not requisite for the acquiring of these, the negative prescription, by which all right of action for recovering their property is cut off, effectually secures the possessor.

Negative  
prescription.

4. The negative prescription of obligations, by the lapse of 40 years, was introduced into our law long before the positive, by (1469, c. 29.—1474, c. 55.) This prescription is now amplified by the forefard act (1617), which has extended it to all actions competent upon heritable bonds, reversions, and others whatsoever; unless where the reversions are either incorporated in the body of the wadset-right, or registered in the register of reversions: And reversions so incorporated, or registered, are not only exempted from the negative prescription, but they are an effectual bar against any person from pleading the positive.

A shorter  
negative  
prescription.

5. A shorter negative prescription is introduced by statute, in certain rights and debts. Actions of spuilzie, ejection, and others of that nature, must be pursued within three years after the commission of the fact on which the action is founded. As in spuilzies and ejections, the pursuer was intitled, *in odium* of violence, to a proof by his own oath *in litem*, and to the violent profits against the defender, the statute meant only to limit these special privileges by a three years prescription, without cutting off the right of action, where the claim is restricted to simple restitution. Under the general words, and others of that nature, are comprehended all actions where the pursuer is admitted to prove his libel by his own oath *in litem*.

Prescription  
of ser-  
vants fees,  
&c.

6. Servants fees, house-rents, mens ordinaries, (i. e. money due for board,) and merchants accounts, fall under the triennial prescription, (by 1579, c. 83.) There is also a general clause subjoined to this statute, of other the like debts, which includes alimentary debts, wages due to workmen, and accounts due to writers, agents, or procurators. These debts may, by this act, be proved after the three years, either by the writing or oath of the debtor; so that they prescribe only as to the mean of proof by witnesses; but after the three

Law of  
Scotland.

years, it behoves the creditor to refer to the debtor's oath, not only the constitution, but the subsistence of the debt. In the prescription of house-rents, servants fees, and alimony, each term's rent, fee, or alimony, runs a separate course of prescription; so that in an action for these, the claim will be restricted to the arrears incurred within the three years immediately before the citation: But, in accounts, prescription does not begin till the last article; for a single article cannot be called an account. Actions of removing must also be pursued within three years after the warning. Reductions of erroneous retours, prescribe, if not pursued within 20 years.

7. Ministers stipends and mutes prescribe in five years after they are due; and arrears of rent, five years after the tenant's removing from the land. As the prescription of mails and duties was introduced in favour of poor tenants, that they might not suffer by neglecting to preserve their discharges, a proprietor of lands subject to a liferent, who had obtained a lease of all the liferented lands from the liferenter, is not intitled to plead it, nor a tackman of one's whole estate, who had by the lease a power of removing tenants. Bargains concerning moveables, or sums of money which are proveable by witnesses prescribe, in five years after the bargain. Under these are included sales, locations, and all other consensual contracts, to the constitution of which writing is not necessary. But all the above mentioned debts, may, after the five years, be proved, either by the oath or the writing of the debtor; of which above, (par. 6.) A quinquennial prescription is established in arrestments, whether on decrees or depending actions: The first prescribe in five years after using the arrestment, and the last in five years after sentence is pronounced on the depending action.

8. No person binding for or with another, either as Limit-  
cautioner or co-principal, in a bond or contract for a sum of money, continues bound after seven years from the date of the bond, provided he has either a clause of relief in the bond, or a separate bond of relief, intimated to the creditor, at his receiving the bond. But all diligence used within the seven years against the cautioner, shall stand good. As this is a public law, intended to prevent the bad consequences of rash engagements, its benefit cannot, before the lapse of the seven years, be renounced by the cautioner. As it is correctory, it is strictly interpreted: Thus, bonds bearing a mutual clause of relief *pro rata*, fall not under it; nor bonds of corroboration, nor obligations, where the condition is not purified, or the term of payment not come within the seven years; because no diligence can be used on these. The statute excludes all cautioneries for the faithful discharge of offices; these not being obligations in a bond or contract for sums of money. And practice has denied the benefit of it to all judicial cautioners, as cautioners in a suspension. Actions of count and reckoning, competent either to minors against their tutors or curators, or *vice versa*, prescribe in ten years after the majority or death of the minor.

9. Holograph bonds, missive letters, and books of Prefe-  
account, not attested by witnesses, prescribe in 20 years, tion of  
unless the creditor shall thereafter prove the verity of lograp  
the subscription by the debtor's oath. It is therefore  
sufficient to save from the effect of this prescription, that

that the constitution of the debt be proved by the party's oath, after the 20 years; whereas in stipends, merchants accounts, &c. not only the constitution, but the subsistence of the debt, must be proved by writing or the debtor's oath, after the term of prescription. Some lawyers extend this prescription of holograph writings to all obligations for sums not exceeding L. 100 *Scots*, which are not attested by witnesses; because though these are in practice sustained, yet they ought not to have the same duration with deeds attested by witnesses. Though in the short prescriptions of debts, the right of action is for ever lost, if not exercised within the time limited; yet where action was brought on any of those debts, before the prescription was run, it subsisted, like any other right, for 40 years. As this defeated the purpose of the acts establishing these prescriptions, all processes upon warnings, spuilzies, ejections, or arrements, or for payment of the debts contained in act 1669, c. 9. are by the said act, joined with 1685, c. 14. declared to prescribe in five years, if not wakened within that time; see N° clxxxiii. 26.

10. Certain obligations are lost by the lapse of less than 40 years, without the aid of statute, where the nature of the obligation, and the circumstances of parties, justify it: thus, bills which are not intended for lasting securities, produce no action, where the creditor has been long silent, unless the subsistence of the debt be proved by the debtor's oath; but the precise time is not fixed by practice. Thus also, a receipt for bills granted by a writer to his employer, not insisted upon for 23 years, was found not productive of an action. The prescriptions of the restitution of minors, of the benefit of inventory, &c. are explained in their proper places.

11. In the positive prescription, as established by the act 1617, the continued possession for 40 years, proceeding upon a title of property not chargeable with falsehood, secures the possessor against all other grounds of challenge, and so presumes *bona fides*, *presumptio juris et de jure*. In the long negative prescription, *bona fides* in the debtor is not required: the creditor's neglecting to insist for so long a time, is construed as an abandoning of his debt, and so is equivalent to a discharge. Hence, though the subsistence of the debt should be referred to the debtor's own oath, after the 40 years, he is not liable.

12. Prescription runs de momento in momentum: the whole time defined by law must be completed, before a right can be either acquired or lost by it; so that interruption, made on the last day of the fortieth year, breaks its course. The positive prescription runs against the sovereign himself, even as to his annexed property, but it is generally thought he cannot suffer by the negative: he is secured against the negligence of his officers, in the management of processes, by express statute, 1600, c. 14. The negative, as well as the positive prescription, runs against the church, though churchmen have but a temporary interest in their benefices. But because the rights of beneficiaries to their stipends are liable to accidents, through the frequent change of incumbents, 13 years possession does, by a rule of the Roman chancery which we have adopted, found a presumptive title in the beneficiary: but this is not properly prescription; for if by titles recovered, perhaps, out of the incumbent's own hands, it shall ap-

pear that he has possessed tithes, or other subjects, to a greater extent than he ought, his possession will be restricted accordingly. This right must not be confounded with that established in favour of churchmen, which is confined to church lands and rents, and constitutes a proper prescription upon a possession of 30 years.

13. The clause in the act 1617, saving minors from prescription, is extended to the positive, as well as to the negative prescription; but the exception of minority is not admitted in the case of hospitals for children, where there is a continual succession of minors, that being a *casus insolitus*. Minors are expressly excepted in several of the short prescriptions, as 1579, c. 18.—1669, c. 9.; but where law leaves them in the common case, they must be subject to the common rules.

14. Prescription does not run *contra non valentem agere*, against one who is barred, by some legal incapacity, from pursuing; for in such case, neither negligence nor dereliction can be imputed to him. This rule is, by a favourable interpretation, extended to wives who *ex reverentia marituli* forbear to pursue actions competent to them against their husbands. On the same ground, prescription runs only from the time that the debt or right could be sued upon. Thus, inhibition prescribes only from the publishing of the deed granted to the inhibitor's prejudice; and in the prescription of removing, the years are computed only from the term at which the defender is warned to remove. Neither can prescription run against persons who are already in possession, and so can gain nothing by a pursuit. Thus, where a person, who has two adjudications affecting the same lands, is in possession upon one of them, prescription cannot run against the other during such possession.

15. Certain rights are incapable of prescription: Certain (1.) Things that law has exempted from commerce. (2.) *Res mera facultatis*, e. g. a faculty to charge a subject with debts, to revoke, &c. cannot be lost by prescription; for faculties may, by their nature, be exercised at any time: hence, a proprietor's right of using any act of property on his own grounds, cannot be lost by the greatest length of time. (3.) Exceptions competent to a person for eliding an action, cannot prescribe, unless the exception is founded on a right productive of an action, e. g. compensation; such right must be insisted on, within the years of prescription. (4.) Obligations of yearly pensions or payments, tho' no demand has been made on them for forty years, do not suffer a total prescription, but still subsist as to the arrears fallen due within that period; because prescription cannot run against an obligation till it be payable, and each year's pension or payment is considered as a separate debt.

16. No right can be lost *non utendo* by one, unless the effect of that prescription be to establish it in another. Hence the rule arises, *juri sanguinis nunquam præscribitur*. Hence also, a proprietor of land cannot lose his property by the negative prescription, unless he who objects it can himself plead the positive. On the same ground, a superior's right of feu-duties cannot be lost *non utendo*; because being inherent in the superiority, it is truly a right of lands that cannot suffer the negative prescription, except in favour of one who can

plead the positive; which the vassal cannot do, being destitute of a title. This rule applies also to parsonage tithes, which are an inherent burden upon all lands not specially exempted; and from which therefore the person liable cannot prescribe an immunity, by bare non-payment: but such vicarage tithes as are only due where they are established by usage, may be lost by prescription. In all these cases, though the radical right cannot suffer the negative prescription, the by-gone duties, not demanded within the forty years, are lost to the proprietor, superior, or titular.

Interrup-  
tion of pre-  
scription.

17. Prescription may be interrupted by any deed, whereby the proprietor or creditor uses his right or ground of debt. In all interruptions, notice must be given to the possessor of the subject, or the debtor, that the proprietor or creditor intends to sue upon his right. All writings whereby the debtor himself acknowledges the debt, and all processes for payment brought or diligences used against him upon his obligation, by hornings, inhibition, arrestment, &c. must be effectual to interrupt prescription.

18. Interruptions, by citation upon libelled summonses, where they are not used by a minor, prescribe, if not renewed every seven years: but where the appearance of parties, or any judicial act has followed thereupon, it is no longer a bare citation, but an action which subsists for forty years. Citations for interrupting the prescription of real rights must be given by messengers; and the summonses, on which such citations proceed, must pass the signet upon a bill, and be registered within sixty days after the execution, in a particular register appointed for that purpose: and where interruption of real rights is made *via facti*, an instrument must be taken upon it, and recorded in the said register; otherwise it can have no effect against singular successors.

19. Interruption has the effect to cut off the course of prescription, so that the person prescribing can avail himself of no part of the former time, but must begin a new course, commencing from the date of the interruption. Minority therefore is no proper interruption; for it neither breaks the course of prescription, nor is it a document or evidence taken by the minor on his right: it is a personal privilege competent to him, by which the operation of the prescription is indeed suspended during the years of minority, which are therefore discounted from it; but it continues to run after majority, and the years before and after the minority may be conjoined to complete it. The same doctrine applies to the privilege arising from one's incapacity to act.

20. Diligence used upon a debt, against any one of two or more co-obligants, preserves the debt itself, and so interrupts prescription against all of them; except in the special case of cautioners, who are not affected by any diligence used against the principal debtor. In the same manner, a right of annualrent, constituted upon two separate tenements, is preserved as to both from the negative prescription, by diligence used against either of them. But whether such diligence has also the effect to hinder the possessor of the other tenement by singular titles from the benefit of the positive prescription, may be doubted.

### III. OF SUCCESSION.

#### SECT. XX. Of Succession in heritable Rights.

class.

SINGULAR successors are those who succeed to a person yet alive, in a special subject by singular titles; but succession, in its proper sense, is a method of transmitting rights from the dead to the living. Heritable rights descend by succession to the heir properly so called; moveable rights, to the executors, who are sometimes said to be heirs in moveables. Succession is either by special destination, which descends to those named by the proprietor himself; or legal, which devolves upon the persons whom the law marks out for successors, from a presumption, that the proprietor would have named them had he made a destination. The first is in all cases preferred to the other, as presumption must yield to truth.

Order of  
succession  
in herit.

2. In the succession of heritages, the heirs at law are otherwise called heirs general, heirs whatsoever, or heirs of line; and they succeed by the right of blood, in the following order. First, descendants sons are preferred to daughters, and the eldest son to all the younger. Where there are daughters only, they succeed equally, and are called heirs-portioners. Failing immediate descendants, grandchildren succeed; and in default of them, great-grandchildren; and so on in *infinitum*; preferring, as in the former case, males to females, and the eldest male to the younger.

3. Next after descendants, collateralers succeed; among whom the brothers *german* of the deceased have the first place. But as, in no case, the legal succession of heritage is, by the law of Scotland, divided into parts, unless where it descends to females; the immediate younger brother of the deceased excludes the rest, according to the rule, *heritage descends*. Where the deceased is himself the youngest, the succession goes to the immediate elder brother, as being the least deviation from this rule. If there are no brothers *german*, the sisters *german* succeed equally: then brothers *consanguinean*, in the same order as brothers *german*; and failing them, sisters *consanguinean* equally. Next, the father succeeds. After him, his brothers and sisters, according to the rules already explained; then the grand-father; failing him, his brothers and sisters; and so upwards, as far back as propinquity can be proved. Though children succeed to their mother, a mother cannot to her child; nor is there any succession by our law through the mother of the deceased; in so much that one brother *uterine*, i. e. by the mother only, cannot succeed to another, even in that estate which flowed originally from their common mother.

No succe-  
sion by  
mother.

4. In heritage there is a right of representation, by which one succeeds, not from any title in himself, but in the place of, and as representing some of his deceased ascendants. Thus, where one leaves a younger son, and a grandchild by his eldest, the grandchild, though farther removed in degree from the deceased than his uncle, excludes him, as coming in place of his father the eldest son. Hence arises the distinction between succession *in capita*, where the division is made into as many equal parts as there are *capita* or heirs, which is the case of heirs-portioners; and succession *in stirps*, where the remoter heirs draw no more among them than the share belonging to their ascendent or *stirps*, whom

Succession  
in capita  
and in  
stirps.

whom

Law of  
Scotland.

whom they represent; an example of which may be figured in the case of one who leaves behind him a daughter alive, and two grand-daughters by a daughter deceased. In which case the two grand-daughters would succeed equally to that half which would have belonged to their mother had she been alive.

Succession  
by heirs-  
portions.

5. In the succession of heirs-portioners, indivisible rights, *e. g.* titles of dignity, fall to the eldest sister. A single right of superiority goes also to the eldest; for it hardly admits a division, and the condition of the vassal ought not to be made worse by multiplying superiors upon him. Where there are more such rights, the eldest may perhaps have her election of the best; but the younger sisters are intitled to a recompence, in so far as the divisions are unequal; at least, where the superiorities yield a constant yearly rent. The principal feat of the family falls to the eldest, with the garden and orchard belonging to it, without recompence to the younger sisters; but all other houses are divided amongst them, together with the lands on which they are built, as parts and pertinents of these lands.

Heir of  
line.

6. Those heritable rights, to which the deceased did himself succeed as heir to his father or other ancestor, get sometimes the name of heritage in a strict sense, in opposition to the *fuda nova*, or feus of conquest, which he had acquired by singular titles, and which descend, not to his heir of line, but of conquest. This distinction obtains only, where two or more brothers or uncles, or their issue, are next in succession; in which case, the immediate younger brother, as heir of line, succeeds to the proper heritage, because that descends; whereas the conquest ascends to the immediate elder brother. It has no place in female succession, which the law divides equally among the heirs-portioners. Where the deceased was the younger brother, the immediate elder brother is heir both of line and of conquest. An estate disposed by a father to his eldest son, is not conquest in the son's person, but heritage; because the son would have succeeded to it, though there had been no disposition. The heir of conquest succeeds to all rights affecting land, which require seisin to perfect them. But teinds go to the heir of line; because they are merely a burden on the fruits, not on the land. Tacks do not fall under conquest, because they are complete rights without seisin; nor personal bonds taken to heirs succeeding executors.

Heirship-  
moveables.

7. The heir of line is entitled to the succession, not only of subjects properly heritable, but to that sort of moveables called *heirship*, which is the best of certain kinds. This doctrine has been probably introduced, that the heir might not have an house and estate to succeed to, quite dismantled by the executor. In that sort which goes by pairs or dozens, the best pair or dozen is the heirship. There is no heirship in fungibles, or things estimated by quantity; as grain, hay, current money, &c. To entitle an heir to this privilege, the deceased must have been either, (1.) A prelate: (2.) A baron, *i. e.* who stood inest in his death in lands, tho' not erected into a barony; or even in a right of annualrent: Or, (3.) A burgess; not an honorary one, but a trading burgess of a royal borough, or at least one entitled to enter burgess in the right of his ancestor. Neither the heir of conquest, nor of talzie, has right to heirship-moveables.

8. As to succession by destination, no proprietor can

settle any heritable estate, in the proper form a testament; not even bonds secluding executors, tho' these are not heritable *ex sua natura*: But, where a testament is in part drawn up in the style of a deed inter vivos, such part of it may contain a settlement of heritage, though executors should be named in the testamentary part. The common method of settling the succession of heritage is by disposition, contract of marriage, or simple procuratory of resignation: and, tho' a disposition settling heritage should have neither precept nor procuratory, it founds an action against the heir of line to complete his titles to the estate; and therefore divest himself in favour of the disponent. The appellation of talzie, or entail, is chiefly used in the case of a land estate, which is settled on a long series of heirs, substituted one after another. The person first called in the talzie, is the institute; the rest, the heirs of talzie, or the substitutes.

Talzie.

9. Talzies, when considered in relation to their several degrees of force, are either, (1.) Simple destinations: (2.) Talzies with prohibitory clauses. (3.) Talzies with prohibitory, resolute, and irritant clauses. That is a simple destination, where the persons called to the succession are substituted one after another, without any restraint laid on the exercise of their property. The heirs, therefore, succeeding to such estate, are absolute heirs, and consequently may alter the destination at pleasure.

10. In talzies with clauses prohibitory, *e. g.* declaring that it shall not be lawful to the heirs to contract debts or alien the lands in prejudice of the succession, none of the heirs can alien gratuitously. But the members of entail may contract debts which will be effectual to the creditors, or may dispose of the estate for onerous causes. In both these sorts, the maker himself may alter the talzie; except, (1.) Where it has been granted for an onerous cause, as in mutual talzies; or, (2.) Where the maker is expressly disabled, as well as the institute or the heirs.

11. Where a talzie is guarded with irritant and resolute clauses, the estate entailed cannot be carried off by the debt, or deed, of any of the heirs succeeding thereto, in prejudice of the substitutes. It was long doubted, whether such talzies ought to be effectual, even where the superior's consent was adhibited; because they sunk the property of estates, and created a perpetuity of liferents. They were first explicitly authorized by 1685, c. 22. By this statute, the entail must be registered in a special register established for that purpose; and the irritant and resolute clauses must be inserted, not only in the procuratories, precepts, and seisms, by which the talzies are first constituted, but in all the after-conveyances thereof; otherwise they can have no force against singular successors. But a talzie, even without these requisites, is effectual against the heir of the granter, or against the institute who accepts of it.

Their re-  
quisites.

12. An heir of entail has full power over the entailed estate, except in so far as he is expressly fettered; and as entails are an unfavourable restraint upon property, and a frequent snare to trading people, they are *strictissimi juris*; so that no prohibition or irritancies are to be inferred by implication. By 10 George III. c. 51. heirs of entail are entitled (notwithstanding any restrictions in the deed of entail) to improve their estates

Heirs of  
entail, their  
powers and  
restrictions.

by

Law of  
Scotland.

by granting leases, building farm-houses, draining, inclosing, and exchanging, under certain limitations, and to claim repayment of three-fourths of the expence from the next heir of entail.—This act extends to all tailzies, whether made prior or posterior to the 1685.

Contraven-  
tion, by  
whom in-  
ferred.

13. An heir, who counteracts the directions of the tailzie, by aliening any part of the estate, charging it with debt, &c. is said to contravene. It is not the simple contracting of debt that infers contravention; the lands entailed must be actually adjudged upon the debt contracted. An heir may, where he is not expressly barred, settle rational provisions on his wife and children, without incurring contravention.

In what  
cases an heir  
may sell.

14. When the heirs of the last person specially called in a tailzie come to succeed, the irritancies have no longer any person in favour of whom they can operate; and consequently, the fee, which was before tailzied, becomes simple and unlimited in the person of such heirs. The king may purchase lands within Scotland, notwithstanding the strictest entail; and where the lands are in the hands of minors or fatuous persons, his majesty may purchase them from the curators or guardians. And heirs of entail may sell to their vassals the superiorities belonging to the entailed estate; but in all these cases, the price is to be settled in the same manner that the lands or superiorities sold were settled before the sale.

Rights  
taken in  
conjunct  
fee.

15. Rights, not only of land-estates, but of bonds, are sometimes granted to two or more persons in conjunct fee. Where a right is so granted to two strangers, without any special clause adjoined to it, each of them has an equal interest in the fee, and the part of the deceased descends to his own heir. If the right be taken to the two jointly, and the *longest liver* and their heirs, the several shares of the conjunct fiars are affectable by their creditors during their lives; but, on the death of any one of them, the survivor has the fee of the whole, in so far as the share of the predeceased remains free, after payment of his debts. Where the right is taken to the two in conjunct fee, and to the heirs of one of them, he to whose heirs the right is taken is the only fiar; the right of the other resolves into a simple liferent: yet where a father takes a right to himself and his son jointly, and to the son's heirs, such right being gratuitous, is not understood to strip the father of the fee, unless a contrary intention shall plainly appear from the tenor of the right.

16. Where a right is taken to a husband and wife, in conjunct fee and liferent, the husband, as the *persona dignior*, is the only fiar: the wife's right resolves into a liferent, unless it be presumable, from special circumstances, that the fee was intended to be in the wife. Where a right of moveables is taken to husband and wife, the heirs of both succeed equally, according to the natural meaning of the words.

Heirs of  
provision.

17. Heirs of provision are those who succeed to any subject, in virtue of a provision in the investiture, or other deed of settlement. This appellation is given most commonly to heirs of a marriage. There are more favourably regarded than heirs by simple destination, who have only the hope of succession; for heirs of a marriage, because their provisions are constituted by an onerous contract, cannot be disappointed of them by any gratuitous deed of the father. Nevertheless, as their right is only a right of succession, which is not

Law of  
Scotland.

designed to restrain the father from granting onerous or rational deeds, he continues to have the full power of selling the subject, or charging it with debts, unless a proper right of credit be given to the heir by the marriage-contract, e. g. if the father should oblige himself to invest the heir in the lands, or make payment of the sum provided against a day certain, or when the child attains a certain age, &c.; for such rights, when perfected by investiture, or secured by diligence, are effectual against all the posterior deeds of the father, even onerous.

Effects of  
provision  
to children.

18. Tho' all provisions to children, by a marriage-contract conceived in the ordinary form, being merely rights of succession, are postponed to every onerous debt of the grantor, even to those contracted posterior to the provisions; yet where a father executes a bond of provision to a child actually existing, whether such child be the heir of a marriage or not, a proper debt is thereby created, which, though it be without doubt gratuitous, is not only effectual against the father himself and his heirs, but is not reducible at the instance even of his prior onerous creditors, if he was solvent at the time of granting it. A father may, notwithstanding a first marriage-contract, settle a jointure on a second wife, or provide the children of a second marriage; for such settlements are deemed onerous; but where they are exorbitant, they will be restricted to what is rational: and in all such settlements, where the provisions of the first marriage-contract are encroached upon, the heirs of that marriage have recourse against the father, in case he should afterwards acquire a separate estate; which may enable him to fulfil both obligations.

Provision  
to heirs.

19. Where heritable rights are provided to the heirs of a marriage, they fall to the eldest son, for he is the heir at law in heritage. Where a sum of money is so provided, the word *heir* is applied to the subject of the provision, and so marks out the executor, who is the heir in moveables. When an heritable right is provided to the *bairns* (or issue) of a marriage, it is divided equally among the children, if no division be made by the father; for such destination cuts off the exclusive right of the legal heir. No provision granted to bairns, gives a special right of credit to any one child, as long as the father lives: the right is granted *familia*; so that the whole must indeed go to one or other of them; but the father has a power inherent in him, to divide it among them, in such proportions as he thinks best; yet so as none of them may be entirely excluded, except in extraordinary cases.

To bairns.

20. A clause of return is that, by which a sum in a bond or other right, is, in a certain event, limited to return. When a right is granted for onerous causes, the creditor may defeat the clause of return, even gratuitously. But, where the sum in the right flows from the grantor, or where there is any other reasonable cause for the provision of return in his favour, the receiver cannot disappoint it gratuitously. Yet since he is fiar, the sum may be either assigned by him for an onerous cause, or affected by his creditors.

Clause of  
return.

21. An heir is, in the judgment of law, *eadem persona cum defuncto*, and so represents the deceased universally, not only in his rights but in his debts: in the first view, he is said to be heir *active*; in the second, *passive*. From this general rule are excepted, heirs substituted

Heirs.

aw of  
otland.

stituted in a special bond, and even substituted in a disposition *omnium bonorum*, to take effect at the grantor's death; for such substitutes are considered as singular successors, and their right as an universal legacy, which does not subject the legatee *ultra valorem*.

parent

22. Before an heir can have an active title to his ancestor's rights, he must be entered by service and retour. He who is entitled to enter heir, is, before his actual entry, called apparent heir. The bare right of appearance carries certain privileges with it. An apparent heir may defend his ancestor's titles against any third party who brings them under challenge. Tenants may safely pay him their rents; and after they have once acknowledged him by payment, he may compel them to continue it; and the rents not uplifted by the apparent heir belong to his executors, upon his death.

deli-  
cious.

23. As an heir is, by his entry, subjected universally to his ancestor's debts, apparent heirs have therefore a year (*annus deliberandi*) allowed to them from the ancestor's decease, to deliberate whether they will enter or not; till the expiring of which, though they may be charged by creditors to enter, they cannot be sued in any process founded upon such charge. Though declaratory actions, and others which contain no personal conclusion, may be pursued against the apparent heir, without a previous charge; actions do not lie even upon these, within the year, if the heir cannot make the proper defences without incurring a passive title. But judicial sales, commenced against an ancestor, may be continued upon a citation of the heir, without waiting the year of deliberating. This *annus deliberandi* is computed, in the case of a posthumous heir, from the birth of such heir. An apparent heir, who, by immixing with the estate of his ancestor, is as much subjected to his debts as if he had entered, can have no longer a right to deliberate whether he will enter or not.

vice of  
s,

24. All services proceed on briefs from the chancery, which are called briefs of inquest, and have been long known in Scotland. The judge, to whom the brief is directed, is required to try the matter by an inquest of fifteen sworn men. The inquest, if they find the claim verified, must declare the claimant heir to the deceased, by a verdict or service, which the judge must attest, and return the brief, with the service proceeding on it, to the chancery.

trial and  
trial.

25. The service of heirs is either general or special. A general service vests the heir in the right of all heritable subjects, which either do not require seisin, or which have not been perfected by seisin in the person of the ancestor. A special service, followed by seisin, vests the heir in the right of the special subjects in which the ancestor died in seisin.

try by  
entory.

26. If an heir, doubtful whether the estate of his ancestor be sufficient for clearing his debts, shall, at any time within the *annus deliberandi*, exhibit upon oath a full inventory of all his ancestor's heritable subjects, to the clerk of the shire where the lands lie; or, if there is no heritage requiring seisin, to the clerk of the shire where he died; and if, after the same is subscribed by the sheriff or sheriff-depute, the clerk, and himself, and registered in the sheriff's books, the extract thereof shall be registered within forty days after expiry of the *annus deliberandi* in the general register appointed for

that purpose, his subsequent entry will subject him no farther than to the value of such inventory. If the inventory be given up and registered within the time prescribed, the heir may serve on it, even after the year.

27. Creditors are not obliged to acquiesce in the value of the estate given up by the heir; but, if they be real creditors, may bring the estate to a public sale, in order to discover its true value; since an estate is always worth what can be got for it. An heir by inventory, as he is, in effect, a trustee for the creditors, must account for that value to which the estate may have been improved since the death of the ancestor, and he must communicate to all the creditors the sales he has got in transacting with any one of them.

28. Practice has introduced an anomalous sort of entry, without the interposition of an inquest, by the sole consent of the superior, who, if he be satisfied that the person applying to him is the next heir, grants him a precept (called of *clare constat*, from the first words of its recital), commanding his baillie to inquest him in the subjects that belonged to his ancestor. These precepts are, no doubt, effectual against the superior who grants them, and his heirs; and they may, when followed by seisin, afford a title of prescription: But as no person can be declared an heir by private authority, they cannot bar the true heir from entering after 20 years, as a legal entry would have done. Of the same nature is the entry by haip and staple, commonly used in burghage tenements of houses; by which the baillie, without calling an inquest, cognosces or declares a person heir, upon evidence brought before himself; and, at the same time inquests him in the subject, by the symbol of the haip and staple of the door. Charges given by creditors to apparent heirs to enter, stand in the place of an actual entry, so as to support the creditor's diligence.

Entry upon  
a precept of  
clare constat.Entry by  
haip and  
staple.

29. A general service cannot include a special one; since it has no relation to any special subject, and carries only that class of rights on which seisin has not proceeded; but a special service implies a general one of the same kind or character, and consequently carries even such rights as have not been perfected by seisin. Service is not required to establish the heir's right in titles of honour, or offices of the highest dignity; for these descend *jure sanguinis*.

30. An heir, by immixing with his ancestor's estate without entry, subjects himself to his debts, as if he had entered; or, in our law-phrase, incurs a passive title. The only passive title by which an apparent heir becomes liable universally for all his ancestor's debts, is *gestio pro herede*, or his behaving as none but an heir has right to do. Behaviour as heir is inferred, from the apparent heir's intromission, after the death of the ancestor, with any part of the lands or other heritable subjects belonging to the deceased, to which he himself might have completed an active title by entry.

Passive  
titles.

31. This passive title is excluded, if the heir's intromission be by order of law; or if it be founded on singular titles, and not as heir to the deceased. But an apparent heir's purchasing any right to his ancestor's estate, otherwise than at public roup (auction), or his possessing it in virtue of rights settled in the person of any near relation of the ancestor, to whom he himself may succeed as heir, otherwise than upon purchase

Gestio pro  
herede.

Law of  
Scotland.

chafe by public sale, is deemed behaviour as heir.

32. Behaviour as heir is also excluded, where the intromission is small, unless an attention to defraud the ancestor's creditors be premissible from the circumstances attending it. Neither is behaviour inferred against the apparent heir, from the payment of his ancestor's debt, which is a voluntary act, and profitable to the creditors: nor by his taking out of briefs to serve; for one may alter his purpose, while it is not completed: nor by his assuming the titles of honour belonging to his ancestor, or exercising an honorary office hereditary in the family; for these are rights annexed to the blood, which may be used without proper representation. But the exercising an heritable office of profit, which may pass by voluntary conveyance, and consequently is adjudicable, may reasonably be thought to infer a passive title. Lastly, as passive titles have been introduced, merely for the security of creditors; therefore, where questions concerning behaviour arise among the different orders of heirs, they are liable to one another no farther than in *valorem* of their several intromissions.

Præceptio  
hereditatis.

33. Another passive title in heritage, may be incurred by the apparent heir's accepting a gratuitous right from the ancestor, to any part of the estate to which he himself might have succeeded as heir; and it is called *præceptio hereditatis*, because it is a taking of the succession by the heir before it opens to him by the death of his ancestor. If the right be onerous, there is no passive title; if the consideration paid for it does not amount to its full value, the creditors of the deceased may reduce it, in so far as it is gratuitous, but still it infers no passive title.

34. The heir incurring this passive title is no farther liable, than if he had at the time of his acceptance entered heir to the granter, and so subjected himself to the debts that were then chargeable against him; but with the posterior debts he has nothing to do, not even with those contracted between the date of the right, and the infestment taken upon it, and he is therefore called *successor titulo lucrativo post contractum debitum*.

35. Neither of these passive titles takes place, unless the subject intermeddled with or disposed be such as the intromitter or receiver would succeed to as heir. In this also, these two passive titles agree, that the intromission in both must be after the death of the ancestor; for there can be no *termini habiles* of a passive title, while the ancestor is alive. But in the following respect they differ: *Gessio pro herede*, being a vicious passive title founded upon a quasi delict, cannot be objected against the delinquent's heir, if process has not been litiscontested while the delinquent himself was alive; whereas the *successor titulo lucrativo* is by the acceptance of the disposition understood to have entered into a tacit contract with the granter's creditors, by which he undertakes the burden of their debts; and all actions founded on contract are transmissible against heirs.

Other pas-  
sive titles.

36. An apparent heir, who is cited by the ancestor's creditor in a process for payment, if he offers any peremptory defence against the debt, incurs a passive title; for he can have no interest to object against it, but in the character of heir. In the same manner, the heir's not renouncing upon a charge to enter heir, infers it: But the effect of both these is limited to the special

debt pursued for, or charged upon. This passive title, which is inferred from the heir's not renouncing, has no effect till decree pass against him; and even a renunciation offered after decree, if the decree be in absence, will intitle the heir to a suspension of all diligence against his person and estate, competent upon his ancestor's debts.

37. By the principles of the feudal law, an heir, when he is to complete his titles by special service, must necessarily pass over his immediate ancestor, *e. g.* his father, if he was not infest; and serve heir to that ancestor who was last vassal and seised in the right, and in whose *hereditas jacens* the right must remain, till a title be connected thereto from him. As this bore hard upon creditors who might think themselves secure in contracting with a person whom they saw for some time in the possession of an estate, and from thence conclude that it was legally vested in him; it is therefore provided, that every person, passing over his immediate ancestor who had been three years in possession, and serving heir to one more remote, shall be liable for the debts and deeds of the person interjected, to the value of the estate to which he is served. This being correctory of the feudal maxims, has been strictly interpreted, so as not to extend to the gratuitous deeds of the person interjected, nor to the case where the interjected person was a naked fiar, and possessed only civilly thro' the liferenter.

38. Our law, from its jealousy of the weakness of mankind while under sickness, and of the importunity of friends on that occasion, has declared that all deeds affecting heritage, if they be granted by a person on death-bed, (*i. e.* after contracting that sickness which ends in death), to the damage of the heir, are ineffectual, except where the debts of the granter have laid him under a necessity to alien his lands. As this law of deathbed is founded solely in the privilege of the heir, deathbed-deeds, when consented to by the heir, are not reducible. The term properly opposed to deathbed is *liege poussie*, by which is understood a state of health; and it gets the name, because persons in health have the *legitima potestas*, or lawful power, of disposing of their property at pleasure.

39. The two extremes being proved, of the granter's sickness immediately before signing, and of his death following it, though at the greatest distance of time, did, by our former law, found a presumption that the deed was granted on death-bed, which could not have been elided but by a positive proof of the granter's convalescence; but now the allegation of death-bed is also excluded, by his having lived 60 days after signing the deed. The legal evidence of convalescence is the granter's having been, after the date of the deed, at kirk OR market unsupported; for a proof of either will secure the deed from challenge. The going to kirk or market must be performed when the people are met together in the church or churchyard for any public meeting, civil or ecclesiastical, or in the market-place at the time of public market. No other proof of convalescence is receivable, because at kirk and market there are always present unsuspected witnesses, which we can hardly be sure of in any other case.

40. The privilege of setting aside deeds *ex capite lesti*, is competent to all heirs, not to heirs of line only; but of conquest, tailzie, or provision; not only to the immediate,

Law of  
Scotland.Redditi  
by the

deed.To wh  
heirs r  
reducit  
compet

immediate, but to remoter heirs, as soon as the succession opens to them. But, where it is consented to or ratified by the immediate heir, it is secured against all challenge, even from the remoter. Yet the immediate heir cannot, by any antecedent writing, renounce his right of reduction, and thereby give strength to deeds that may be afterwards granted *in lecto* to his hurt; for no private renunciation can authorise a person to act contrary to a public law; and such renunciation is presumed to be extorted through the fear of exheredation. If the heir should not use this privilege of reduction, his creditor may, by adjudication, transfer it to himself; or he may, without adjudication, reduce the deed, libelling upon his interest as creditor to the heir: But the grantor's creditors have no right to this privilege, in regard that the law of death-bed was introduced, not in behalf of the grantor himself, but of his heir.

41. The law of death-bed strikes against dispositions of every subject to which the heir would have succeeded, or from which he would have had any benefit, had it not been so disposed. Deathbed-deeds granted in consequence of a full or proper obligation in *liege poustie*, are not subject to reduction; but, where the antecedent obligation is merely natural, they are reducible. By stronger reason, the deceased cannot, by a deed merely voluntary, alter the nature of his estate on death-bed to the prejudice of his heir, so as from heritable to make it moveable; but if he should, in *liege poustie*, exclude his apparent heir, by an irrevocable deed containing reserved faculties, the heir cannot be heard to quarrel the exercise of these faculties on death-bed.

42. In a competition between the creditors of the deceased and of the heir, our law has justly preferred the creditors of the deceased, as every man's estate ought to be liable, in the first place, for his own debt. But this preference is, by the statute, limited to the case where the creditors of the deceased have used diligence against their debtor's estate, within three years from his death; and therefore the heir's creditors may, after that period, affect it for their own payment. All dispositions by an heir, of the ancestor's estate, within a year after his death, are null, in so far as they are hurtful to the creditors of the ancestor. This takes place, though these creditors should have used no diligence, and even where the dispositions are granted after the year: It is thought they are ineffectual against the creditors of the deceased who have used diligence within the three years.

### SECT. XXI. Of Succession in Moveables.

In the succession of moveable rights, it is an universal rule, that the next in degree to the deceased (or next of kin) succeeds to the whole; and if there are two or more equally near, all of them succeed by equal parts, without that prerogative, which takes place in heritage, of the eldest son over the younger, or of males over females. Neither does the right of representation, explained N<sup>o</sup> clxxx. 4. obtain in the succession of moveables, except in the single case of a competition between the full blood and the half blood; for a niece by the full blood will be preferred before a brother by the half blood, though she is by one degree more remote from the deceased than her uncle. Where the estate of a person deceased consists partly of heritage,

and partly of moveables, the heir in the heritage has no share of the moveables, if there are others as near in degree to the deceased as himself: But where the heir, in such case, finds it his interest to renounce his exclusive claim to the heritage, and betake himself to his right as one of the next of kin, he may collate or communicate the heritage with the others, who in their turn must collate the moveables with him; so that the whole is thrown into one mass, and divided equally among all of them. This doctrine holds, not only in the line of descendants, but of collaterals; for it was introduced, that the heir might in no case be worse than the other next of kin.

2. One may settle his moveable estate upon whom he pleases, excluding the legal successor, by a testament; which is a written declaration of what a person wills to be done with his moveable estate after his death. No testamentary deed is effectual, till the death of the testator; who may therefore revoke it at pleasure, or make a new one, by which the first loses its force; and hence testaments are called *last* or *latter wills*. Testaments in their strict acceptation, must contain a nomination of executors, *i. e.* of persons appointed to administer the succession according the will of the deceased: Yet nothing hinders one from making a settlement of moveables, in favour of an universal legatee, though he should not have appointed executors; and on the other part, a testament where executors are appointed, is valid, though the person who is to have the right of succession should not be named. In this last case, if the executor nominated be a stranger, *i. e.* one who has no legal interest in the moveable estate, he is merely a trustee, accountable to the next of kin; but he may retain a third of the dead's part (explained par. 6.) for his trouble in executing the testament; in payment of which, legacies, if any be left to him, must be imputed. The heir, if he be named executor, has right to the third as a stranger; but if one be named who has an interest in the legal succession, he has no allowance, unless such interest be less than a third. Nuncupative or verbal testaments are not, by the law of Scotland, effectual for supporting the nomination of an executor, let the subject of the succession be ever so small: But verbal legacies, not exceeding *L. 100 Scots*, are sustained; and even where they are granted for more, they are ineffectual only as to the excess.

3. A legacy is a donation by the deceased, to be paid by the executor to the legatee. It may be granted either in the testament or in a separate writing. Legacies are not due till the grantor's death; and consequently they can transmit no right to the executors of the legatee, in the event that the grantor survives him.

4. Legacies, where they are general, *i. e.* of a certain sum of money indefinitely, give the legatee no right in any one debt or subject; he can only insist in a personal action against the executor, for payment out of the testator's effects. A special legacy, *i. e.* of a particular debt due to the deceased, or of a particular subject belonging to him, is of the nature of an assignment, by which the property of the special debt or subject vests, upon the testator's death, in the legatee, who can therefore directly sue the debtor or possessor: Yet as no legacy can be claimed till the debts are paid, the executor must be cited in such process, that it may be known, whether there are free effects sufficient for

Succession in moveables by designation.

Legacy.

Law of  
Scotland.

Law of  
Scotland.

answering the legacy. Where there is not enough for payment of all the legacies, each of the general legatees must suffer a proportional abatement : But a special legatee gets his legacy entire, though there should be nothing over for payment of the rest ; and, on the contrary, he has no claim, if the debt or subject bequeathed should perish, whatever the extent of the free execruty may be.

Who can  
test, and  
under what  
restrictions.

5. Minors, after puberty, can test without their curators, wives without their husbands, and persons interdicted without their interdictors : but bastards cannot test, except in the cases afterwards set forth, N° clxxii. 3. As a certain share of the goods, falling under the communion that is consequent on marriage, belongs, upon the husband's decease, to his widow, *jure relicte*, and a certain share to the children, called the *legitime*, *portion-natural*, or *bairns' part of gear* ; one who has a wife or children, though he be the absolute administrator of all these goods during his life, and consequently may alien them by a deed *inter vivos* in *liege poustie*, even gratuitously, if no fraudulent intention to disappoint the wife or children shall appear, yet cannot impair their shares gratuitously on death-bed ; nor can he dispose of his moveables to their prejudice by testament, though it should be made in *liege poustie* ; since testaments do not operate till the death of the testator, at which period the division of the goods in communion have their full effect in favour of the widow and children.

Division of  
testament.

6. If a person deceased leaves a widow, but no child, his testament, or, in other words, the goods in communion, divide in two : one half goes to the widow ; the other is the dead's part, *i. e.* the absolute property of the deceased, on which he can test, and which falls to his next of kin, if he dies intestate. Where he leaves children, one or more, but no widow, the children get one half as their legitime : the other half is the dead's part ; which falls also to the children, if the father has not tested upon it. If he leaves both widow and children, the division is tripartite : the wife takes one third by herself ; another falls, as legitime, to the children equally among them, or even to an only child, though he should succeed to the heritage ; the remaining third is the dead's part. Where the wife predeceases without children, one half is retained by the husband, the other falls to her next of kin : Where she leaves children, the division ought also to be bipartite, by the common rules of society, since no legitime is truly due on a mother's death : yet it is in practice tripartite ; two thirds remain with the surviving father, as if one third were due to him *proprio nomine*, and another as administrator of the legitime for his children ; the remaining third, being the wife's share, goes to her children, whether of that or any former marriage, for they are all equally her next of kin.

What debts  
affect the  
execruty.

7. Before a testament can be divided, the debts owing by the deceased are to be deducted ; for all execruty must be free. As the husband has the full power of burdening the goods in communion, his debts affect the whole, and so lessen the legitime and the share of the relicte, as well as the dead's part. His funeral charges, and the mournings and alimony due to the widow, are considered as his proper debts ; but the legacies, or other gratuitous rights, granted by him on death-bed, affect only the dead's part. Bonds bearing interest, due by the deceased, cannot diminish the relicte's share,

because such bonds, when due to the deceased, do not increase it. The funeral charges of the wife predeceasing, fall wholly on her executors who have right to her share. Where the deceased leaves no family, neither husband, wife, nor child, the testament suffers no division, but all is the dead's part.

8. The whole issue of the husband, not only by that marriage which was dissolved by his death, but by any former marriage, has an equal interest in the legitime ; otherwise the children of the first marriage would be cut out, as they could not claim the legitime during their father's life. But no legitime is due, (1.) Upon the death of a mother. (2.) Neither is it due to grandchildren, upon the death of a grandfather. Nor, (3.) To children forisfamiliari, *i. e.* to such as, by having renounced the legitime, are no longer considered as in *familia*, and so are excluded from any farther share of the moveable estate than they have already received.

9. As the right of legitime is strongly founded in nature, the renunciation of it is not to be inferred by implication. Renunciation by a child of his claim of legitime has the same effect as his death, in favour of the other children intitled thereto ; and consequently the share of the renouncer divides among the rest ; but he does not thereby lose his right to the dead's part, if he does not also renounce his share in the father's execruty. Nay, his renunciation of the legitime, where he is the only younger child, has the effect to convert the whole subject thereof into dead's part, which will therefore fall to the renouncer himself as next of kin, if he be not willing to collate the heritage with him.

Renunciation  
of legitime.

10. For preserving an equality among all the children, who continue intitled to the legitime, we have adopted the Roman doctrine of *collatio bonorum* ; whereby the child, who has got a provision from his father, is obliged to collate it with the others, and impute it towards his own share of the legitime ; but if, from the deed of provision, the father shall appear to have intended it as a *præcipuum* to the child, collation is excluded. A child is not bound to collate an heritable subject provided to him, because the legitime is not impaired by such provision. As this collation takes place only in questions among children who are intitled to the legitime, the relicte is not bound to collate donations given her by her husband, in order to increase the legitime ; and on the other part, the children are not obliged to collate their provisions, in order to increase her share.

Collation  
among  
younger  
children.

11. As an heir in heritage must complete his titles by entry, so an executor is not vested in the right of the moveable estate of the deceased without confirmation. Confirmation is a sentence of the commissary or bishop's court, empowering an executor, one or more, upon making inventory of the moveables pertaining to the deceased, to recover, possess, and administer them, either in behalf of themselves, or of others interested therein. Testaments must be confirmed in the commissariat where the deceased had his principal dwelling-house at his death. If he had no fixed residence, or died in a foreign country, the confirmation must be at *Edinburgh*, as the *communis forum* ; but if he went abroad with an intention to return, the commissariat within which he resided, before he left Scotland, is the only proper court.

Confirm-  
ation.

12. Confirmation proceeds upon an edict, which is affixed on the door of the parish-church where the deceased dwelt, and serves to intimate to all concerned the day of confirmation, which must be nine days at least after publishing the edict. In a competition for the office of executor, the commissary prefers, *primo loco*, the person named to it by the deceased himself, whose nomination he ratifies or confirms, without any previous decerniture: this is called the confirmation of a testament-testamentary. In default of an executor named by the deceased, universal disponses are by the present practice preferred; after them, the next of kin; then the relict; then creditors; and, lastly, special legatees. All these must be decerned executors, by a sentence called a *decreo-dative*; and if afterwards they incline to confirm, the commissary authorises them to administer, upon their making inventory, and giving security to make the subject thereof forthcoming to all having interest; which is called the confirmation of a testament-dative.

13. A creditor, whose debtor's testament is already confirmed, may sue the executor, who holds the office for all concerned, to make payment of his debt. Where there is no confirmation, he himself may apply for the office, and confirm as executor-creditor; which intitles him to sue for and receive the subject confirmed, for his own payment: and where one applies for a confirmation as executor-creditor, every co-creditor may apply to be conjoined with him in the office. As this kind of confirmation is simply a form of diligence, creditors are exempted from the necessity of confirming more than the amount of their debts.

14. A creditor, whose debt has not been constituted, or his claim not closed by decree, during the life of his debtor, has no title to demand directly the office of executor *qua* creditor: but he may charge the next of kin who stands off, to confirm, who must either renounce within twenty days after the charge, or be liable for the debt; and if the next of kin renounces, the pursuer may constitute his debt, and obtain a decree *cognitionis causâ*, against the *hereditas jacentis* of the moveables, upon which he may confirm as executor-creditor to the deceased. Where one is creditor, not to the deceased, but to his next of kin who stands off from confirming, he may affect the moveables of the deceased, by obtaining himself decerned executor-dative to the deceased, as if he were creditor to him, and not to his next of kin.

15. Where an executor has either omitted to give up any of the effects belonging to the deceased in inventory, or has estimated them below their just value, there is place for a new confirmation, *ad omnia, vel male appretiatâ*, at the suit of any having interest; and if it appears that he has not omitted or undervalued any subject *dolese*, the commissary will ordain the subjects omitted, or the difference between the estimations in the principal testament and the true values, to be added thereto; but if dole shall be presumed, the whole subject of the testament *ad omnia vel male appretiatâ*, will be carried to him who confirms it, to the exclusion of the executor in the principal testament.

16. The legitimate and relict's share, because they are rights arising *ex lege*, operate *ipso jure*, upon the father's death, in favour of the relict and children; and consequently pass from them, though they should die before

confirmation, to their next of kin: whereas the dead's part, which falls to the children or other next of kin in the way of succession, remains, if they should die before confirming, *in bonis* of the first deceased; and so does not descend to their next of kin, but may be confirmed by the person who, at the time of confirmation, is the next of kin to the first deceased. Special assignations, though neither intimated, nor made public, during the life of the granter, carry to the assignee the full right of the subjects assigned, without confirmation. Special legacies are really assignations, and so fall under this rule. The next of kin, by the bare possession of the *ipsa corpora* of moveables, acquires the property thereof without confirmation, and transmits it to his executors.

17. The confirmation of any one subject by the next of kin, as it proves his right of blood, has been adjudged to carry the whole executry out of the testament of the deceased, even what was omitted, and to transmit all to his own executors. The confirmation of a stranger, who is executor nominated, as it is merely a trull for the next of kin, has the effect to establish the right of the next of kin to the subjects confirmed, in the same manner as if himself had confirmed them.

18. Executry, though it carries a certain degree of representation of the deceased, is properly an office: executors therefore are not subjected to the debts due by the deceased, beyond the value of the inventory; but, at the same time, they are liable in diligence for making the inventory effectual to all having interest. An executor-creditor who confirms more than his debt amounts to, is liable in diligence for what he confirms. Executors are not liable in interest, even upon such bonds recovered by them as carried interest to the deceased, because their office obliges them to retain the sums they have made effectual, in order to a distribution thereof among all having interest. This holds though they should again lend out the money upon interest, as they do it at their own risk.

19. There are certain debts of the deceased called privileged debts, which were always preferable to every other. Under that name are comprehended, medicines furnished to the deceased on death-bed, physicians fees during that period, funeral charges, and the rent of his house, and his servants wages for the year or term current at his death. These the executors are in safety to pay on demand. All the other creditors, who either obtain themselves confirmed, or who cite the executor already confirmed, within six months after their debtor's death, are preferred, *pari passu*, with those who have done more timely diligence; and therefore no executor can either retain for his own debt, or pay a testamentary debt, so as to exclude any creditor, who shall use diligence within the six months, from the benefit of the *pari passu* preference; neither can a decree for payment of debt be obtained, in that period, against an executor, because, till that term be elapsed, it cannot be known how many creditors may be intitled to the fund in his hands. If no diligence be used within the six months, the executor may retain for his own debt, and pay the residue *primo venienti*. Such creditors of the deceased as have used diligence within a year after their debtor's death, are preferable on the subject of his testament to the creditors of his next of kin.

20. The only passive title in moveables is vitious intromission,

Law of Scotland.

Vicious intromission.

Law of Scotland.

trommiffion; which may be defined, an unwarrantable intermeddling with the moveable estate of a person deceased, without the order of law. This is not confined, as the passive titles in heritage are, to the persons interested in the fucceffion, but ftrikes againft all intrumitters whatever. Where an executor confirmed, intrumits with more than he has confirmed, he incurs a paffive title; fraud being in the common cafe prefumed from his not giving up in inventory the full fubject intermeddled with. Vicious intromiffion is alfo prefumed, where the repositories of a dying perfon are not fealed up, as foon as he becomes incapable of fenfe, by his neareft relations; or, if he dies in a houfe not his own, they muft be fealed by the mafter of fuch houfe, and the keys delivered to the judge-ordinary, to be kept by him, for the benefit of all having intereft.

21. The paffive title of vicious intromiffion does not take place where there is any probable title or circumftance that takes off the prefumption of fraud. In confequence of this rule, neceffary intromiffion, or *custodia caufa*, by the wife or children, who only continue the poffeffion of the deceased, in order to preferve his goods for the benefit of all concerned, infers no paffive title. And, upon the fame principle, an intrumitter, by confirming himfelf executor, and thereby fubjecting himfelf to account, before action be brought againft him on the paffive titles, purges the viciousity of his prior intromiffion: and where the intrumitter is one who is interefted in the fucceffion, *e. g.* next of kin, his confirmation, at any time within a year from the death of the deceased, will exclude the paffive title, notwithstanding a prior citation. As this paffive title is intended only for the fecurity of creditors, it cannot be fued upon by legatees; and fince it arifes *ex delicto*, it cannot be pleaded againft the heir of the intrumitter. As in delicts, any one of many delinquents may be fubjected to the whole punifhment, fo any one of many intrumitters may be fued in *folidum* for the purfuer's debt, without calling the reft; but the intrumitter who pays, has an action of relief againft the others for their fhare of it. If the intrumitters are fued jointly, they are liable, not *pro rata* of their feveral intromiffions, but *pro virili*.

28. The whole of a debtors estate is fubjected to the payment of his debts; and therefore, both his heirs and executors are liable for them, in a queftion with creditors: but as fucceffion is by law divided into the heritable and the moveable estate, each of thefe thought, in a queftion between the feveral fucceffors, to bear the burdens which naturally affect it. Action of relief is accordingly competent to the heir who has paid a moveable debt, againft the executor; and *vice verfa*. This relief is not cut off by the deceased's having difpofed either his land-estate or his moveables, with the burden of his whole debts; for fuch burden is not to be conftrued as an alteration of the legal fucceffion, but merely as a farther fecurity to creditors, unlefs the contrary fhall be prefumed from the fpecial ftyle of the difpofition.

Mutual relief betwixt the heir and executor.

elxxvii.

Where there is no heir, the king fucceeds.

#### IV. OF LAST HEIRS AND BASTARDS.

By our ancient praftice, feudal grants taken to the vaffal, and to a fpecial order of heirs, without fettling the laft termination upon heirs *whatsoever*, returned to

the fuperior, upon failure of the fpecial heirs therein contained; but now that feus are become patrimonial rights, the fuperior is, by the general opinion, held to be fully difvefted by fuch grant, and the right defends to the vaffal's heirs at law. And even where a vaffal dies without leaving any heir who can prove the remotest propinquity to him, it is not the fuperior, as the old law flood, but the king, who fucceeds as laft heir, both in the heritable and moveable estate of the deceased, in confequence of the rule, *Quod nullius est, cedit domino Regi*.

2. If the lands, to which the king fucceeds, be holden immediately of himfelf, the property is confolidated with the fuperiority, as if refignation had been made in the fovereign's hands. If they are holden of a fubject, the king, who cannot be vaffal to his own fubject, names a donatory; who, to complete his title, muft obtain a decree of declarator; and thereafter he is prefented to the fuperior, by letters of prefentation from the king under the quarter-feal, in which the fuperior is charged to enter the donatory. The whole estate of the deceased is, in this cafe, fubjected to his debts, and to the widow's legal provifions. Neither the king nor his donatory is liable beyond the value of the fucceffion. A perfon who has no heir to fucceed to him, cannot alien his heritage in *leſto*, to the prejudice of the king, who is intitled to fet afide fuch deed, in the character of *ultimus heres*.

3. A baftard can have no legal heirs, except thoſe of his own body; fince there is no fucceffion but by the father, and a baftard has no certain father. The king therefore fucceeds to him, failing his lawful iffue, as laft heir. Though the baftard, as absolute proprietor of his own estate, can difpofe of his heritage in *liege pouſſie*, and of his moveables by any deed *inter vivos*; yet he is diſabled, *ex defectu natalium*, from bequeathing by teſtament, without letters of legitimation from the fovereign. If the baftard has lawful children, he may teſt, without fuch letters, and name tutors and curators to his iffue. Letters of legitimation, let their clauſes be ever fo ftrong, cannot enable the baftard to fucceed to his natural father, to the excluſion of lawful heirs.

4. The legal rights of fucceffion, being founded in marriage, can be claimed only by thoſe who are born in lawful marriage; the iffue therefore of an unlawful marriage are incapable of fucceffion. A baftard is excluded, (1.) From his father's fucceffion; becauſe law knows no father who is not marked out by marriage. (2.) From all heritable fucceffion, whether by the father or mother; becauſe he cannot be pronounced lawful heir by the inqueſt, in terms of the brief. And, (3.) From the moveable fucceffion of his mother; for, though the mother be known, the baftard is not her lawful child, and legitimacy is implied in all fucceffion conferred by law. A baftard, though he cannot fucceed *jure ſanguinis*, may fucceed by deftination, where he is fpecially called to the fucceffion by an entail or teſtament.

5. Certain perſons, though born in lawful marriage, are incapable of fucceffion. Aliens are, from their allegiance to a foreign prince, incapable of fucceeding in feudal rights, without naturalization. Children born in a foreign ſtate, whoſe fathers were natural born ſubjects, and not attained, are held to be natural born ſubjects.

King ſucceeds as *ultimus heres* to the baftard.

Baſtards incapable of legal, but not of defined, fucceffion.

Aliens are not ſubjects in feudal rights;

subjects. Persons educated in, or professing, the Popish religion, if they shall neglect, upon their attaining the age of fifteen, to renounce its doctrines by a signed declaration, cannot succeed in *heritage*; but must give place to the next Protestant heir, who will hold the estate irredeemably, if the Popish heir does not, within ten years after incurring the irritancy, sign the *formula* prescribed by the statute 1700, c. 3.

## C H A P. III.

## Of ACTIONS.

**H**ITHERTO of *Persons* and *Rights*, the two first objects of law: *Actions* are its third object, whereby persons make their rights effectual.

SECT. I. *Nature, division, &c. of Actions.*

An action may be defined, A demand regularly made and insisted in, before the judge competent, for the attaining or recovering of a right; and it suffers several divisions, according to the different natures of the rights pursued upon.

2. Actions are either real or personal. A real action is that which arises from a right in the thing itself, and which therefore may be directed against all possessors of that thing: thus, an action for the recovery, even of a moveable subject, when founded on a *jus in re*, is in the proper acceptation real; but real actions are, in vulgar speech, confined to such as are directed against heritable subjects. A personal action is founded only on an obligation undertaken for the performance of some fact, or the delivery of some subject; and therefore can be carried on against no other than the person obliged, or his heirs.

3. Actions, again, are either ordinary or rescissory. All actions are, in the sense of this division, ordinary, which are not rescissory. Rescissory actions are divided, (1.) Into actions of proper improbation. (2.) Actions of reduction improbation. (3.) Actions of simple reduction. Proper improbations, which are brought for declaring writings false or forged, are noticed below, N<sup>o</sup> clxxxvi. 32. Reduction-improbation is an action, whereby a person who may be hurt or affected by a writing, insists for producing or exhibiting it in court, in order to have it set aside, or its effect ascertained, under the certification that the writing, if not produced, shall be declared false and forged. This certification is a fiction of law, introduced that the production of writings may be the more effectually forced, and therefore it operates only in favour of the pursuer. Because the summons in this action proceeds on alleged grounds of falsehood, his majesty's advocate, who is the public prosecutor of crimes, must concur in it.

4. As the certification in this process draws after it so heavy consequences, two terms are assigned to the defenders for production. After the second term is elapsed, intimation must be made judicially to the defender, to satisfy the production within ten days; and till these are expired, no certification can be pronounced. Certification cannot pass against deeds recorded in the books of session, if the defender shall, before the second term, offer a condescendence of the dates of their registration, unless falsehood be objected: in which case, the original must be brought from the record to

the court. But an extract from the inferior court is no bar to certification; the principal writing must be laid before the court of session on a proper warrant.

5. In an action of simple reduction the certification is only temporary, declaring the writings called for, null, until they be produced; so that they recover their full force after production, even against the pursuer himself; for which reason, that process is now seldom used. Because its certification is not so severe as in reduction-improbation, there is but one term assigned to the defender for producing the deeds called for.

6. The most usual grounds of reduction of writings are, the want of the requisite solemnities; that the grantor was minor, or interdicted, or inhibited; or that he signed the deed on death-bed, or was compelled or frightened into it, or was circumvented; or that he granted it in prejudice of his lawful creditors.

7. In reductions on the head of force, or fear, or fraud and circumvention, the pursuer must libel the particular circumstances from which his allegation is to be proved. Reduction is not competent upon every degree of force or fear; it must be such as would shake a man of constancy and resolution. Neither is it competent, on that fear which arises from the just authority of husbands or parents over their wives or children, nor upon the fear arising from the regular execution of lawful diligence by caption, provided the deeds granted under that fear relate to the ground of debt contained in the diligence; but if they have no relation to that debt, they are reducible *ex metu*.

8. Alienations granted by debtors after contracting of lawful debts, in favour of conjunct or confident persons, without just and necessary causes, and without a just price really paid, are null. One is deemed a prior creditor, whose ground of debt existed before the right granted by the debtor; though the written voucher of the debt should bear a date posterior to it. Persons are accounted conjunct, whose relation to the grantor is so near, as to bar them from judging in his cause. Confident persons are those who appear to be in the grantor's confidence, by being employed in his affairs, or about his person; as a doer, steward, or domestic servant.

9. Rights, though gratuitous, are not reducible, if the grantor had, at the date thereof, a sufficient fund for the payment of his creditors. Provisions to children are, in the judgment of law, gratuitous; so that their effect, in a question with creditors, depends on the solvency of the grantor: but settlements to wives, either in marriage-contracts, or even after marriage, are onerous, in so far as they are rational; and consequently are not reducible, even though the grantor was insolvent. This rule holds also in rational tochers contracted to husbands: But it must, in all cases, be qualified with this limitation, *if the insolvency of the grantor was not publicly known*; for if it was, fraud is presumed in the receiver of the right, by contracting with the bankrupt.

10. The receiver of the deed, if he be a conjunct or confident person, must altrust or support the onerous cause of his right, not merely by his own oath, but by some circumstances or adminicles. But where a right is granted to a stranger, the narrative of it expressing an onerous cause, is sufficient *per se* to secure it against reduction.

Simple reduction.

Grounds of reduction.

Scotland.

11. All voluntary payments or rights made by a bankrupt to one creditor, to disappoint the more timely diligence of another, are reducible at the instance of that creditor who has used the prior diligence. A creditor, though his diligence be but begun by citation, may insist in a reduction of all posterior voluntary rights granted to his prejudice; but the creditor who neglects to complete his begun diligence within a reasonable time, is not intitled to reduce any right granted by the debtor, after the time that the diligence is considered as abandoned.

12. A prohibited alienation, when conveyed by the receiver to another who is not privy to the fraud, subsists in the person of the *bona fide* purchaser. In the case of moveable rights, this nullity is receivable by exception; but it must be declared by reduction, where the right is heritable.

13. By act 1696, c. 5. all alienations by a bankrupt, within sixty days before his bankruptcy, to one creditor in preference to another, are reducible, at the instance even of such co-creditors as had not used the least step of diligence. A bankrupt is there described by the following characters; diligence used against him by horning and caption; and insolvency, joined either with imprisonment, retiring to the sanctuary, absconding, or forcibly defending himself from diligence. It is sufficient that a caption is raised against the debtor, though it be not executed, provided he has retired to slun it. It is provided, that all heritable bonds or rights on which seisin may follow, shall be reckoned, in a question with the grantor's other creditors upon this act, to be of the date of the seisin following thereon. But this act was found to relate only to securities for former debts, and not to *nova debita*.

Actions ci-  
ther rei per-  
secutorie, or  
penal.

14. Actions are divided into *rei persecutorie*, and *penales*. By the first, the pursuer insists barely to recover the subject that is his, or the debt due to him; and this includes the damage sustained; for one is as truly a sufferer in his patrimonial interest by that damage, as by the loss of the subject itself. In penal actions, which always arise *ex delicto*, something is also demanded by way of penalty.

Spuilzie.

15. Actions of spuilzie, ejection, and intrusion, are penal. An action of spuilzie is competent to one dispossessed of a moveable subject violently, or without order of law, against the person dispossessing: not only for being restored to the possession of the subject, if extant, or for the value, if it be destroyed, but also for the violent profits, in case the action be brought within three years from the spoliation. Ejection and intrusion are, in heritable subjects, what spuilzie is in moveables. The difference between the two first is, that in ejection, violence is used; whereas the intruder enters into the void possession, without either a title from the proprietor, or the warrant of a judge. The actions arising from all the three are of the same general nature.

Contraven-  
tion of law  
borrowers.

16. The action of contravention of law-borrowers is also penal. It proceeds on letters of law-borrowers, (from *borgh* a cautioner), which contain a warrant to charge the party complained upon, that he may give security, not to hurt the complainer in his person, family, or estate. These letters do not require the previous citation of the party complained upon, because the caution which the law requires is only for doing

what is every man's duty; but, before the letters are executed against him, the complainer must make oath that he dreads bodily harm from him. The penalty of contravention is ascertained to a special sum, according to the offender's quality; the half to be applied to the filk, and the half to the complainer. Contravention is not incurred by the uttering of reproachful words, where they are not accompanied, either with acts of violence, or at least a real injury; and as the action is penal, it is elided by any probable ground of excuse.

17. Penalties are the consequences of delict, or transgression; and as no heir ought to be accountable for the delict of his ancestor, farther than the injured person has really suffered by it, penal actions die with the delinquent, and are not transmissible against heirs. Yet the action, if it has been commenced and litiscontested in the delinquent's lifetime, may be continued against the heir, though the delinquent should die during the dependence. Some actions are *rei persecutorie* on the part of the pursuer, when he insists for simple restitution; which yet may be penal in respect of the defender; *e. g.* the action on the passive title of vitious intromission, by which the pursuer frequently recovers the debt due to him by the deceased, though it should exceed the value of the goods intermeddled with by the defenders.

18. The most celebrated division of actions in our law is into *petitory*, *possessory*, and *declaratory*. *Petitory* actions are those, where something is demanded from the defender, in consequence of a right of property, or of credit in the pursuer: Thus, actions for restitution of moveables, actions of pawning, of forthcoming, and indeed all personal actions upon contracts or quasi-contracts, are petitory. *Possessory* actions are those which are founded, either upon possession alone, as spuilzies; or upon possession joined with another title, as removings; and they are competent either for getting into possession, for holding it, or for recovering it; analogous to the interdicts, of the Roman law, *quorum bonorum, uti possidetis, and unde vi*.

Penal ac-  
tions, whe-  
ther trans-  
missible a-  
gainst the  
pursuer.

possessory.

16. An action of molestation is a possessory action, Of molesta-  
tion.  
competent to the proprietor of a land-estate, against those who disturb his possession. It is chiefly used in questions of commonry, or of controverted marches. Where a declarator of property is conjoined with a process of molestation, the session alone is competent to the action. Actions on briefs of perambulation, have the same tendency with molestations, *viz.* the settling of marches between conterminous lands.

20. The actions of mails and duties is sometimes Of mails  
petitory, and sometimes possessory. In either case, it and duties  
is directed against the tenants and natural possessors of land-estates, for payment to the pursuer of the rents remaining due by them for past crops, and of the full rent for the future. It is competent, not only to a proprietor whose right is perfected by seisin, but to a simple disponee, for a disposition of lands includes a right to the mails and duties; and consequently to an adjudger, for an adjudication is a judicial disposition. In the petitory action, the pursuer, since he founds Petitory  
upon right, not possession, must make the proprietor, from whom the tenants derive their right, party to the suit; and he must support his claim by titles of property or diligences, preferable to those in the person  
of

Law of Scotland.

Accessory.

Accessory judgment.

Accessory action.

Action for proving the or.

Adminicles writing.

of his competitor. In the possessory, the pursuer who libels that he, his ancestors or authors, have been seven years in possession, and that therefore he has the benefit of a possessory judgment, need produce no other title than a feisin, which is a title sufficient to make the possession of heritage lawful; and it is enough, if he calls the natural possessors, though he should neglect the proprietor. A possessory judgment founded on seven years possession, in consequence either of a feisin or a tack, has this effect, that though one should claim under a title preferable to that of the possessor, he cannot compete with him in the possession, till in a formal process of reduction he shall obtain the possessor's title declared void.

21. A declaratory action is that, in which some right is craved to be declared in favour of the pursuer, but nothing sought to be paid or performed by the defender, such as declarators of marriage, of irritancy, of expiry, of the legal reversion, &c. Under this class may be also comprehended rescissory actions, which, without any personal conclusion against the defender, tend simply to set aside the rights or writings libelled, in consequence of which a contrary right or immunity arises to the pursuer. Decrees upon actions that are properly declaratory confer no new right; they only declare what was the pursuer's right before, and so have a retrospect to the period at which that right first commenced. Declarators, because they have no personal conclusion against the defender, may be pursued against an apparent heir without a previous charge given him to enter to his ancestor; unless where special circumstances require a charge.

22. An action for proving the tenor, whereby a writing, which is destroyed or amissing, is endeavoured to be revived, is in effect declaratory. In obligations that are extinguishable barely by the debtor's retiring or cancelling them, the pursuer, before a proof of the tenor is admitted, must confound on such a *casus amissionis*, or accident by which the writing was destroyed, as shews it was lost when in the creditor's possession; otherwise bonds that have been cancelled by the debtor on payment, might be reared upon as still subsisting against him: But in writings which require contrary deeds to extinguish their effect, as assignments, dispositions, charters, &c. it is sufficient to libel that they were lost, even *casu fortuito*.

23. Regularly, no deed can be revived by this action, without some adminicle in writing, referring to that which is libelled; for no written obligation ought to be raised up barely on the testimony of witnesses. If these adminicles afford sufficient conviction that the deed libelled did once exist, the tenor is admitted to be proved by witnesses, who must depose, either that they were present at signing the deed, or that they afterwards saw it duly subscribed. Where the relative writings contain all the substantial clauses of that which is lost, the tenor is sometimes sustained without witnesses. In a writing which is libelled to have contained uncommon clauses, all these must appear by the adminicles. Actions of proving the tenor are, on account of their importance, appropriated to the court of Session; and, by the old form, the testimony of the witnesses could not be received but in presence of all the judges.

24. The action of double or multiple poiding may

be also reckoned *declaratory*. It is competent to a debtor, who is distressed, or threatened with distress, by two or more persons claiming right to the debt, and who therefore brings the several claimants into the field, in order to debate and settle their several preferences, that so he may pay securely to him whose right shall be found preferable. This action is daily pursued by an arrester, in the case of several arrements used in his hands for the same debt; or by tenants in the case of several adjudgers, all of whom claim right to the same rents. In these competitions, any of the competitors may bring an action of multiple-poiding in name of the tenants, or other debtors, without their consent, or even though they should disclaim the process; since the law has introduced it as the proper remedy for getting such competitions determined: And while the subject in controversy continues *in medio*, any third person who conceives he has a right to it, may, though he should not be cited as a defender, produce his titles, as if he were an original party to the suit, and will be admitted for his interest in the competition.

25. Certain actions may be called *accessory*, because they are merely preparatory or subservient to other actions. Thus, exhibitions *ad deliberandum*, at the instance of an heir against the creditors or custodians of his ancestor's writings, are intended only to pave the way for future processes. An action of transference is also of this sort, whereby an action, during the pendency of which the defender happens to die, is craved to be transferred against his representative, in the same condition in which it stood formerly. Upon the pursuer's death his heir may insist in the cause against the defender, upon producing, either a retour or a confirmed testament, according as the subject is heritable or moveable. Transferences being but incidental to other actions, can be pronounced by that inferior judge alone before whom the principal cause depended; but, where the representatives of the deceased live in another territory, it is the supreme court must transfer. Obligations may now be registered summarily after the creditor's death; which before was not admitted, without a separate process of registration, to which the granter was necessarily to be made a party.

26. A process of wakening is likewise accessory. An action is said to sleep, when it lies over not insisted in for a year, in which case its effect is suspended; but even then it may, at any time within the years of prescription, be revived or wakened by a summons, in which the pursuer recites the last step of the process, and concludes that it may be again carried on as if it had not been discontinued. An action that stands upon any of the inner-house rolls cannot sleep; nor an action in which decree is pronounced, because it has got its full completion: Consequently the decree may be extracted after the year, without the necessity of a wakening.

27. An action of transumpt falls under the same class. It is competent to those who have a partial interest in writings that are not in their own custody, against the possessors thereof, for exhibiting them, that they may be transumed for their behoof. Though the ordinary title in this process be an obligation by the defender to grant transumps to the pursuer, it is sufficient if the pursuer can show that he has an interest in the writings; but in this case, he must transume them on his

Accessory actions.

Transference.

Wakening.

Transumpt.

I aw of  
Scotland.

on his own charges. Actions of transump are pursued before any judge-ordinary. After the writings to be transumped are exhibited, full duplicates are made out, collated, and signed, by one of the clerks of court, which are called *transumps*, and are as effectual as an extract from the register.

Brieves.

28. Actions proceeded anciently upon brieves issuing from the chancery, directed to the justiciary or judge-ordinary, who tried the matter by a jury, upon whose verdict judgment was pronounced: And to this day, we retain certain brieves, as of *inquest*, *terce*, *idiotry*, *tutory*, *perambulation*, and perhaps two or three others: But summonses were, immediately upon the institution of the College of Justice, introduced in the place of brieves. A summons, when applied to actions pursued before the session, is a writ in the King's name, issuing from his signet upon the pursuer's complaint, authorizing messengers to cite the defender to appear before the court and make his defences; with certification if he fail to appear, that decree will be pronounced against him in terms of the certification of the summonses.

Summonses

29. The days indulged by law to a defender, between his citation and appearance, to prepare for his defence, are called *inducias legales*: If he is within the kingdom, 21 and 6 days, for the first and second diets of appearance, must be allowed him for that purpose; and if out of it, 60 and 15. Defenders residing in Orkney or Zetland must be cited on 40 days. In certain summonses which are privileged, the *inducias* are shortened: Spuilzies and ejections proceed on 15 days; wakenings and transferences, being but incidental, on six; see the list of privileged summonses, in act of sederunt June 29. 1672. A summons must be executed, *i. e.* served against the defender, so as the last diet of appearance may be within a year after the date of the summons; and it must be called within a year after that diet, otherwise it falls for ever. Offence against the authority of the court, acts of malversation in office by any member of the college of justice, and acts of violence and oppression committed during the dependence of a suit by any of the parties, may be tried without a summons, by a summary complaint.

Concours  
of actions.

30. Where an action is in part penal, *e. g.* a removing, spuilzie, &c. a pursuer who restricts his demand to, and obtains a decree merely for, restitution, cannot thereafter bring a new process for the violent profits. Yet the same fact may be the foundation both of a criminal and civil action, because these two are intended for different purposes; the one for satisfying the public justice, the other for indemnifying the private party: And though the defender should be absolved in the criminal trial, for want of evidence, the party injured may bring an action *ad civilem effectum*, in which he is intitled to refer the libel to the defender's oath.

Accumula-  
tion of ac-  
tions

31. One libel or summons may contain different conclusions on the same ground of right, rescissory, declaratory, petitory, &c. if they be not repugnant to each other: Nay, though different sums be due to one, upon distinct grounds of debt, or even by different debtors, the creditor may insist against them all in the same summonses.

Defences.

32. Defences are pleas offered by a defender for eluding an action. They are either dilatory, which do

not enter into the cause itself, and so can only procure an absolution from the *lit pendens*: Or peremptory, which entirely cut off the pursuer's right of action. The first, because they relate to the forms of proceeding, must be offered in *limine judicii*, and all of them at once. But peremptory defences may be proposed at any time before sentence.

33. A cause, after the parties had litigated it before the judge, was said by the Romans to be *litiscontestata*. By *litiscontestata* a judicial contract is understood to be entered into by the litigants, by which the action is perpetuated against heirs, even when it arises *ex delicto*. By our law, *litiscontestata* is not formed till an act is extracted, admitting the libel or defences to proof.

Litiscon-  
tation.

## SECT. II. Of Probation.

clxxxi

ALL allegations by parties to a suit, must be supported by proper proof. Probation is either by writing, by the party's own oath, or by witnesses. In the case of allegations, which may be proved by either of the three ways, a proof is said to be admitted *prout de prout delibet*; because, in such case, all the legal methods of probation are competent to the party: if the proof he brings by writing be lame, he may have recourse either to witnesses or to his adversary's oath; but, if he should first take himself to the proof by oath, he cannot thereafter use any other probation, for the reason assigned par. 3. and, on the contrary, a pursuer, who has brought a proof by witnesses, on an extracted act, is not allowed to recur to the oath of the defender. Single combat, as a sort of appeal to Providence, was, by our ancient law, admitted as evidence, in matters both civil and criminal. It was afterwards restricted to the case of such capital crimes where no other proof could be had; some traces of this blind method of trial remained even in the reign of James VI. who, by 1600, c. 12. might authorize duels on weighty occasions.

by single  
combat

2. As obligations or deeds signed by the party himself, or his ancestors or authors, must be, of all evidence, the least liable to exception; therefore every debt or allegation may be proved by proper evidence in writing. The solemnities essential to probative deeds have been already explained, No clxxiv. 3. *et seq.* Books of account kept by merchants, tradesmen, and other dealers in business, though not subscribed, are probative against him who keeps them; and, in case of furnishings by a shop-keeper, such books, if they are regularly kept by him, supported by the testimony of a single witness, afford a *semiplena probatio* in his favour, which becomes full evidence by his own oath in supplement. Notarial instruments and executions by messengers bear full evidence, that the solemnities therein set forth were used, not to be invalidated otherwise than by a proof of falsehood; but they do not prove any other extrinsic facts therein averred, against third parties.

3. Regularly, no person's right can be proved by his own oath, nor taken away by that of his adversary; because these are the bare averments of parties in their own favour. But, where the matter in issue is referred by one of the parties to the oath of the other, such oath, though made in favour of the deponent himself, is decisive of the point; because the reference is a virtual contract between the litigants, by which they are understood to put the issue of the cause upon what shall be

Probatio  
oath of  
party in re-  
ference.

Law of  
Scotland.

be depofed: and this contract is fo ftrictly regarded, that the party who refers to the oath of the other cannot afterwards, in a civil action, plead upon any deed againft the party depofing, inconflift with his oath. To obviate the fnares that may be laid for perjury, he, to whole oath of verity a point is referred, may refufe to depofe, till his adverfary fwear that he can bring no other evidence in proof of his allegation.

4. A defender, though he cannot be compelled to fwear to facts in a libel properly criminal; yet may, in trepfaffes, where the conclufion is limited to a fine, or to damages. In general, an oath of party cannot either hurt or benefit third parties; being, as to them, *res inter alios acta*.

Qualified  
this.

5. An oath upon reference, is fometimes qualified by fpecial limitations reftricting it. The qualities which are admitted by the judge as part of the oath, are called *intrinsic*; thofe which the judge rejects or feparates from the oath, *extrinsic*. Where the quality makes a part of the allegation which is relevantly referred to oath, it is *intrinsic*. Thus, becaufe a merchant, fuing for furnifhings after the three years, muft, in order to make a relevancy, offer to prove by the defender's oath, not only the delivery of the goods, but that the price is ftill due; therefore, though the defender fhould acknowledge upon oath his having received the goods, yet, if he adds, that he paid the price, this laft part, being a denial that the debt fubfifts, is *intrinsic*, fince it is truly the point referred to oath. Where the quality does not import an extinction of the debt, but barely a counter-claim, or *mutua petitio*, againft the purfuer, it is held as *extrinsic*, and muft be proved *aliunde*. Neither can a defender who in his oath admits the confitution of a debt, get off by adjecting the quality of payment, where the payment ought by its nature to be vouched by written evidence.

Oaths in  
fupplement

6. Oaths of verity are fometimes deferred by the judge to either party, *ex officio*; which becaufe they are not founded on any implied contract between the litigants, are not finally decifive, but may be traverfed on proper evidence afterwards produced. Thefe oaths are commonly put by the judge for fupplying a lame or imperfect proof, and are therefore called oaths in fupplement. See par. 2.

Oath of  
calumny.

7. To prevent groundlefs allegations, oaths of calumny have been introduced, by which either party may demand his adverfary's oath, that he believes the fact contained in his libel or defences to be juft and true. As this is an oath, not of verity, but only of opinion, the party who puts it to his adverfary does not renounce other probation; and therefore no party is bound to give an oath of calumny, on recent facts of his own, for fuch oath is really an oath of verity. Thefe oaths have not been fo frequent fince the aft of feditious, Feb. 1. 1715, whereby any party, againft whom a fact fhall be alleged, is obliged, without making oath, to confels or deny it; and, in cafe of calumnious denial, is fubjected to the expence that the other party has thereby incurred.

8. In all oaths, whether of verity or calumny, the citation carries, or at leaft implies, a certification, that if the party does not appear at the day affigned for depofing, he fhall be held *pro confeffo*; from a prefumption of his confcioufnefs, that the fact upon which he declines to fwear makes againft him; but no party can

Law of  
Scotland.A non me  
mini oath.Oath in li-  
tem.

be held *pro confeffo*, if he be in the kingdom, without a previous perfonal citation ufed againft him. Though an oath which refolves into a *non memini*, cannot be laid to prove any point; yet where one fo depofes upon a recent fact, to which he himfelf was privy, his oath is confidered as a diflembling of the truth, and he is held *pro confeffo*, as if he had refufed to fwear.

9. An oath *in litem*, is that which the judge defers to a purfuer, for afcertaining either the quantity or the value of goods which have been taken from him by the defender without order of law, or the extent of his damages. An oath *in litem*, as it is the affirmation of a party in his own behalf, is only allowed where there is proof that the other party has been engaged in fome illegal aft, or where the public policy has made it neceffary, (fee No clxxiii. 11.) This oath, as to the quantities, is not admitted, where there is a concurring testimony of witneffes brought in proof of it. When it is put as to the value of goods, it is only an oath of credulity; and therefore it has always been fubject to the modification of the court.

Probation  
by witneffes,  
in what cafes  
rejected.

10. The law of Scotland rejects the testimony of witneffes, (1.) In payment of any fum above *L. 100 Scots*, all which muft be proved either *cripto vel juramento*. (2.) In all gratuitous promifes, though for the fmalleft trifle. (3.) In all contracts, where writing is either effential to their confitution, (fee No clxxiv. 2.) or where it is ufually adhibited, as in the borrowing of money. And it is a general rule, fubject to the reftrictions mentioned in the next par. that no debt or right, once conflituted by writing, can be taken away by witneffes.

in what ad-  
mitted.

11. On the other part, probation by witneffes is admitted to the extent of *L. 100 Scots*, in payments, nuncupative legacies, and verbal agreements which contain mutual obligations. And it is received to the higheft extent, (1.) In all bargains which have known engagements naturally arifing from them, concerning moveable goods. (2.) In facts performed in fatisfaction, even of a written obligation, where fuch obligation binds the party precifely to the performance of them. (3.) In facts which with difficulty admit of a proof by writing, even though the effect of fuch proof fhould be the extinction of a written obligation, efpecially if the facts import fraud or violence; thus, a bond is reducible *ex dolo*, on a proof by witneffes. Laftly, all intromifion by a creditor with the rents of his debtor's eftate payable in grain, may be proved by witneffes; and even intromifion with the filver-rent, where the creditor has entered into the total poffeffion of the debtor's lands.

What per-  
fons rejec-  
ted as wit-  
neffes.

12. No perfon, whole near relation to another bars him from being a judge in his caufe, can be admitted as a witnefs for him; but he may, againft him, except a wife or child, who cannot be compelled to give testimony againft the husband or parent, *ob reverentiam perfona, et metum perjurii*. Though the witnefs, whole propinquity to one of the parties is objected to, be as nearly related to the other, the objection ftands good.

13. The testimony of infamous perfons is rejected, *i. e.* perfons who have been guilty of crimes that law declares to infer infamy, or who have been declared infamous by the fentence of a judge; but *infamia facti* does not difqualify a witnefs. Pupils are inhabile wit-

[ o ]

neffes;

Law of  
Scotland.

nesses; being, in the judgment of law, incapable of the impressions of an oath. The testimony of women is seldom admitted, where other witnesses can be had. And in general witnesses otherwise exceptionable may, where there is a penury of witnesses arising from the nature or circumstances of the fact, be received *cum nota*; that is, their testimony, though not quite free from suspicion, is to be conjoined with the other evidence, and to have such weight given it as the judge shall think it deserves.

Purgation  
of witnesses.

14. All witnesses, before they are examined in the cause, are purged of partial counsel; that is, they must declare, that they have no interest in the suit, nor have given advice how to conduct it; that they have got neither bribe nor promise, nor have been instructed how to depose; and that they bear no enmity to either of the parties. These, because they are the points put to a witness before his making oath, are called *initialia testimonii*. Where a party can bring present proof of a witness's partial counsel, in any of the above particulars, he ought to offer it before the witness be sworn; but, because such objection, if it cannot be instantly verified, will be no bar to the examination, law allows the party in that case to protest for *reprobator*, before the witness is examined; i. e. that he may be afterwards allowed to bring evidence of his enmity, or other inability. Reprobator is competent even after sentence, where protestation is duly entered; but in that case, the party insisting must consign *l. 100 Scots*, which he forfeits if he succumb. This action must have the concurrence of the king's advocate, because the conclusion of it imports perjury; and for this reason, the witness must be made a party to it.

Diligence  
against wit-  
nesses.

15. The interlocutory sentence or warrant, by which parties are authorized to bring their proof, is either by way of act, or of incident diligence. In an act, the Lord Ordinary who pronounces it, is no longer judge in the process; but in an incident diligence, which is commonly granted upon special points, that do not exhaust the cause, the Lord Ordinary continues judge. If a witness does not appear at the day fixed by the warrant of citation, a second warrant is granted of the nature of a caption, containing a command to messengers to apprehend and bring him before the court. Where the party to whom a proof is granted, brings none within the term allowed by the warrant, an interlocutor is pronounced, circumventing the term, and precluding him from bringing evidence thereafter. Where evidence is brought, if it be upon an act, the Lord Ordinary on the acts, after the term for proving is elapsed, declares the proof concluded; and thereupon a state of the case is prepared by the Ordinary on concluded causes, which must be judged by the whole Lords; but if the proof be taken upon an incident diligence, the import of it may be determined by the Lord Ordinary in the cause.

Circum-  
duction.

Prefump-  
tions.

16. Where facts do not admit a direct proof, presumptions are received as evidence, which, in many cases, make as convincing a proof as the direct. Presumptions are consequences deduced from facts known or proved, which infer the certainty, or at least a strong probability, of another fact to be proved. This kind of probation is therefore called *artificial*, because it requires a reasoning to infer the truth of the point in question, from the facts that already appear in proof. Presump-

tions are either, 1. *juris et de jure*; 2. *juris*; or, 3. *hominis* or *judicii*. The first sort obtains, where statute or custom establishes the truth of any point upon a presumption; and it is so strong, that it rejects all proof that may be brought to elide it in special cases. Thus, the testimony of a witness, who forwardly offers himself without being cited, is, from a presumption of his partiality, rejected, let his character be ever so fair; and thus also, a minor, because he is by law presumed incapable of conducting his own affairs, is, upon that presumption, disabled from acting without the consent of his curators, though he should be known to behave with the greatest prudence. Many such presumptions are fixed by statute.

17. *Presumptiones juris* are those, which our law-books or decisions have established, without founding any particular consequence upon them, or statuting *super presumpso*. Most of this kind are not proper presumptions inferred from positive facts, but are founded merely on the want of a contrary proof; thus, the legal presumptions for freedom, for life, for innocence, &c. are in effect so many negative propositions, that servitude, death, and guilt, are not to be presumed, without evidence brought by him who makes the allegation. All of them, whether they be of this sort, or proper presumptions, as they are only conjectures formed from what commonly happens, may be elided, not only by direct evidence, but by other conjectures, affording a stronger degree of probability to the contrary. *Presumptiones hominis* or *judicii*, are those which arise daily from the circumstances of particular cases; the strength of which is to be weighed by the judge.

18. A *factio juris* differs from a presumption. Things are presumed, which are likely to be true; but a fiction of law assumes for truth what is either certainly false, or at least is as probably false as true. Thus an heir is feigned or considered in law as the same person with his ancestor. Fictions of law must, in their effects, be always limited to the special purposes of equity for which they were introduced; see an example, *N<sup>o</sup> lxxxiii. 3.*

### SECT. III. Of Sentences and their Executions.

clxx

PROPERTY would be most uncertain, if debateable points might, after receiving a definitive judgment, be brought again in question, at the pleasure of either of the parties: every fate has therefore fixed the character of final to certain sentences or decrees, which in the Roman law are called *res judicate*, and which exclude all review or rehearing.

Res ju-  
cate.

2. Decrees of the court of session, are either *in foro contradictorio*, where both parties have litigated the cause, or in absence of the defender. Decrees of the session *in foro* cannot, in the general case, be again brought under the review of the court, either on points which the parties neglected to plead before sentence (which we call *competent* and *omitted*), or upon points pleaded and found insufficient (proposed and repelled.) But decrees, though *in foro*, are reversible by the court, where either they labour under essential nullities; e. g. where they are *ultra petita*, or not conformable to their grounds and warrants, or founded on an error in calcul, &c.; or where the party against whom the decree is obtained has thereafter recovered evidence

Decree  
foro.

Res ju-  
cate.

Law of Scotland.

evidence sufficient to overturn it, of which he knew not before.

two consecutive interlocutors final.

3. As parties might formerly reclaim against the sentences of the session, at any time before extracting the decree, no judgment was final till extract; but now, a sentence of the inner-house, either not reclaimed against within six feudent days after its date, or adhered to upon a reclaiming bill, though it cannot receive execution till extract, makes the judgment final as to the court of session. And, by an order of the house of Lords, March 24. 1725, no appeal is to be received by them from sentences of the session, after five years from extracting the sentence; unless the person entitled to such appeal be minor, clothed with a husband, *non compos mentis*, imprisoned, or out of the kingdom. Sentences pronounced by the Lord Ordinary have the same effect, if not reclaimed against, as if they were pronounced in presence; and all petitions against the interlocutor of an Ordinary must be preferred within eight feudent days after signing such interlocutor.

decrees in absence.

4. Decrees, in absence of the defender, have not the force of *res judicata* as to him; for where the defender does not appear, he cannot be said to have subjected himself by the judicial contract which is implied in liti-contestation: a party therefore may be restored against these, upon paying to the other his costs in recovering them. The sentences of inferior courts may be reviewed by the court of session,—before decree, by advocacy,—and after decree, by suspension or reduction; which two last are also the methods of calling in question such decrees of the session itself, as can again be brought under the review of the court.

decrees reviewed either by reduction or suspension.

5. Reduction is the proper remedy, either where the decree has already received full execution by payment, or where it decrees nothing to be paid or performed, but simply declares a right in favour of the pursuer. Suspension is that form of law by which the effect of a sentence condemnatory, that has not yet received execution, is stayed or postponed till the cause be again considered. The first step towards suspension is a bill preferred to the Lord Ordinary on the bills. This bill, when the desire of it is granted, is a warrant for issuing letters of suspension which pass the signet; but, if the presenter of the bill shall not, within 14 days after passing it, expedite the letters, execution may proceed on the sentence. Suspensions of decrees *in foro* cannot pass, but by the whole lords in time of session, and by three in vacation time; but other decrees may be suspended by any one of the judges.

suspensions must give caution.

6. As suspension has the effect of staying the execution of the creditor's legal diligence, it cannot, in the general case, pass without caution given by the suspender to pay the debt, in the event it shall be found due. Where the suspender cannot, from his low or suspected circumstances, procure unquestionable security, the lords admit jutory caution, *i. e.* such as the suspender swears is the best he can offer; but the reasons of suspension are, in that case, to be considered with particular accuracy at passing the bill. Decrees in favour of the clergy, of universities, hospitals, or parish-schoolmasters, for their stipends, rents, or salaries, cannot be suspended, but upon production of discharges, or on consignment of the sums charged for.

Law of Scotland.

A charger, who thinks himself secure without a caution, and wants dispatch, may, where a suspension of his diligence is sought, apply to the court to get the reasons of suspension summarily discussed on the bill.

Suspension, when competent.

7. Though he, in whose favour the decree suspended is pronounced, be always called the charger, yet a decree may be suspended before a charge be given on it. Nay, suspension is competent even where there is no decree, for putting a stop to any illegal act whatsoever: thus, a building, or the exercise of a power which one assumes unwarrantably, is a proper subject of suspension. Letters of suspension are considered merely as a prohibitory diligence; so that the suspender, if he would turn provoker, must bring an action of reduction. If upon discussing the letters of suspension, the reasons shall be sustained, a decree is pronounced, suspending the letters of diligence on which the charge was given *simpliciter*; which is called a *decree of suspension*, and takes off the effect of the decree suspended. If the reasons of suspension be repelled, the court find the letters of diligence orderly proceeded, *i. e.* regularly carried on; and they ordain them to be put to farther execution.

8. Decrees are carried into execution, by diligence, either against the person or against the estate of the debtor. The first step of personal execution is by letters of horning, which pass, by warrant of the court of session, on the decrees of magistrates of boroughs, sheriffs, admirals, and commissaries. If the debtor does not obey the will of the letters of horning within the days of the charge, the charger, after denouncing him rebel, and registering the horning, may apply for letters of caption, which contain a command, not only to messengers, but to magistrates, to apprehend and imprison the debtor. All messengers and magistrates, who refuse their assistance in executing the caption, are liable *subsidiariè* for the debt; and such subsidiary action is supported by the execution of the messenger employed by the creditor, expressing that they were charged to concur, and would not. Letters of caption contain an express warrant to the messenger, in case he cannot get access, to break open all doors and other lock-fast places.

Execution of decrees.

9. Law secures peers, married women, and pupils, against personal execution by caption upon civil debts. No caption can be executed against a debtor within the precincts of the king's palace of Holyroodhouse: but this privilege of sanctuary afforded no security to criminals, as that did which was, by the canon law, conferred on churches and religious houses. Where the personal presence of a debtor, under caption, is necessary in any of our supreme courts, the judges are empowered to grant him a protection, for such time as may be sufficient for his coming and going, not exceeding a month.

What persons are secured against caption.

10. After a debtor is imprisoned, he ought not to be indulged the benefit of the air, not even under a guard; for creditors have an interest, that their debtors be kept under close confinement, that, by the *squalor carceris*, they may be brought to pay their debt: and any magistrate or jailor, who shall suffer the prisoner to go abroad, without a proper attestation, upon oath, of the dangerous state of his health, is liable *subsidiariè* for the debt. Magistrates are in like manner

Prisoners must be closely confined.

Law of  
Scotland.

liable, if they shall suffer a prisoner to escape, through the insufficiency of their prison : but, if he shall escape under night, by the use of instruments, or by open force, or by any other accident which cannot be imputed to the magistrates or jailor, they are not chargeable with the debt ; provided they shall have, immediately after his escape, made all possible search for him. Regularly, no prisoner for debt upon letters of a caption, though he should have made payment, could be released without letters of suspension, containing a charge to the jailor to set him at liberty ; because the creditor's discharge could not take off the penalty incurred by the debtor for contempt of the king's authority : but to save unnecessary expence to debtors in small debts, jailors are empowered to let go prisoners where the debt does not exceed 200 merks *Scots*, upon production of a discharge, in which the creditor consents to his release.

Liberation  
upon a *cessio bonorum*;

11. Our law, from a consideration of compassion, allows insolvent debtors to apply for a release from prison, upon a *cessio bonorum*, i. e. upon their making over to the creditors all their estate real and personal. This must be insisted for by way of action, to which all the creditors of the prisoner ought to be made parties. The prisoner must, in this action, which is cognizable only by the court of session, exhibit a particular inventory of his estate, and make oath that he has no other estate than is therein contained, and that he has made no conveyance of any part of it, since his imprisonment, to the hurt of his creditors. He must also make oath, whether he has granted any disposition of his effects before his imprisonment, and condescend on the persons to whom, and on the cause of granting it ; that the court may judge, whether, by any collusive practice, he has forfeited his claim to liberty.

not com-  
petent to  
delin-  
quents.

12. A fraudulent bankrupt is not allowed this privilege ; nor a criminal who is liable in any afflictment or indemnification to the party injured or his executors, though the crime itself should be extinguished by a pardon. A disposition granted on a *cessio bonorum* is merely in farther security to the creditors, not in satisfaction or *in solutum* of the debts. If, therefore, the debtor shall acquire any estate after his release, such estate may be attached by his creditors, as if there had been no *cessio*, except in so far as is necessary for his subsistence. Debtors, who are set free on a *cessio bonorum*, are obliged to wear a habit proper to dyvours or bankrupts. The lords are prohibited to dispense with this mark of ignominy, unless, in the summons and process of *cessio*, it be libelled, sustained, and proved, that the bankruptcy proceeds from misfortune. And bankrupts are condemned to submit to the habit, even where no suspicion of fraud lies against them, if they have been dealers in an illicit trade.

Dyvour's  
habit.

13. Where a prisoner for debt declares upon oath, before the magistrate of the jurisdiction, that he has not therewith to maintain himself, the magistrate may set him at liberty, if the creditor, in consequence of whose diligence he was imprisoned, does not aliment him within ten days after intimation made for that purpose. But the magistrate may, in such case, detain him in prison, if he chuses to bear the burden of the aliment rather than release him. The statute authorising this release, which is usually called the *act of grace*, is limited to the case of prisoners for civil debts.

Act of  
grace.

14. Decrees are executed against the moveable estate of the debtor by arrestment or pointing ; and against his heritable estate, by inhibition, or adjudication. If one be condemned, in a removing or other process, to quit the possession of lands, and refuses, notwithstanding a charge, letters of ejection are granted of course, ordaining the sheriff to eject him, and to enter the obtainer of the decree into possession. Where one opposes by violence the execution of a decree, or of any lawful diligence, which the civil magistrate is not able by himself and his officers to make good, the execution is enforced *manu militari*.

Law of  
Scotland.

Execution  
against the  
debtor's  
estate.

15. A decree-arbitral, which is a sentence proceeding on a submission to arbiters, has some affinity with a judicial sentence, though in most respects the two differ. A submission is a contract entered into by two or more parties who have disputable rights or claims, whereby they refer their differences to the final determination of an arbiter or arbiters, and oblige themselves to acquiesce in what shall be decided. Where the day within which the arbiters are to decide, is left blank in the submission, practice has limited the arbiters power of deciding to a year. As this has proceeded from the ordinary words of style, empowering the arbiters to determine betwixt and the day of

Decrees-  
arbitral.

Submissi-

next to come ; therefore, where a submission is indefinite, without specifying any time, like all other contracts or obligations, it subsists for 40 years. Submissions, like mandates, expire by the death of any of the parties-submitters before sentence. As arbiters are not vested with jurisdiction, they cannot compel witnesses to make oath before them, or havers of writings to exhibit them ; but this defect is supplied by the court of session, who, at the suit of the arbiters, or of either of the parties, will grant warrant for citing witnesses, or for the exhibition of writings. For the same reason, the power of arbiters is barely to decide ; the execution of the decree belongs to the judge. Where the submitters consent to the registration of the decree-arbitral, performance may be enforced by summary diligence.

16. The power of arbiters is wholly derived from the consent of parties. Hence where their powers are limited to a certain day, they cannot pronounce sentence after that day. Nor can they subject parties to a penalty higher than that which they have agreed to in the submission. And where a submission is limited to special claims, sentence pronounced on subjects not specified in the submission is null, as being *ultra vires compromissi*.

Powers  
of arbiters.

17. But, on the other part, as submissions are designed for a most favourable purpose, the amicable composing of differences, the powers thereby conferred on arbiters receive an ample interpretation. Decrees-arbitral are not reducible upon any ground, except corruption, bribery, or falsehood.

ible.

#### SECT. IV. Of Crimes.

THE word *crime*, in its most general sense, includes every breach, either of the law of God, or of our country ; in a more restricted meaning, it signifies such transgressions of law as are punishable by courts of justice. Crimes were, by the Roman law, divided into public and private. Public crimes were those that were expressly declared such by some law or constitution, and

clxxx  
Crim-

public,

and

law of  
Scotland.  
ivate.

and which, on account of their more atrocious nature and hurtful consequences, might be prosecuted by any member of the community. Private crimes could be pursued only by the party injured, and were generally punished by a pecuniary fine to be applied to his use. By the law of Scotland, no private party, except the person injured, or his next of his kin, can accuse criminally: but the king's advocate, who in this question represents the community, has a right to prosecute all crimes *in vindictam publicam*, though the party injured should refuse to concur. Smaller offences, as petty riots, injuries, &c. which do not demand the public vengeance, pass generally by the appellation of *delicta*, and are punished either by fine or imprisonment.

at essen-  
to  
ies.

2. The essence of a crime is, that there be an intention in the actor to commit it; for an action in which the will of the agent has no part, is not a proper object either of rewards or punishments: hence arises the rule, *crimen dolo contrahitur*. Simple negligence does not therefore constitute a proper crime. Yet where it is extremely gross, it may be punished arbitrarily. Far less can we reckon in the number of crimes, those committed by an idiot or furious person: but lesser degrees of fatuity, which only darken reason, will not afford a total defence, though they may save from the *pœna ordinaria*. Actions committed in drunkenness are not to be considered as involuntary, seeing the drunkenness itself, which was the first cause of the action, is both voluntary and criminal.

3. On the same principle, such as are in a state of infancy, or in the confines of it, are incapable of a criminal action, dole not being incident to that age; but the precise age at which a person becomes capable of dole, being fixed neither by nature nor by statute, is by our practice to be gathered by the judge, as he best can, from the understanding and manners of the person accused. Where the guilt of a crime arises chiefly from statute, the actor, if he is under puberty, can hardly be found guilty; but, where nature itself points out its deformity, he may, if he is *proximus pubertati*, be more easily presumed capable of committing it: yet, even in that case, he will not be punished *pœna ordinaria*.

ieffo-  
i, or act  
al part.

4. One may be guilty of a crime, not only by perpetrating it himself, but being accessory to a crime committed by another; which last is by civilians styled *ope et consilio*, and, in our law-phrase, *art and part*. A person may be guilty, art and part, either by giving advice or counsel to commit the crime; or, 2. By giving warrant or mandate to commit it; or, 3. By actually assisting the criminal in the execution. It is generally agreed by doctors, that, in the more atrocious crimes, the adviser is equally punishable with the criminal; and that, in the slighter, the circumstances arising from the adviser's lesser age, the jocular or careless manner of giving advice, &c. may be received as pleas for softening the punishment. One who gives mandate to commit a crime, as he is the first spring of action, seems more guilty than the person employed as the instrument in executing it; yet the actor cannot excuse himself under the pretence of orders which he ought not to have obeyed.

5. Assistance may be given to the committer of a crime, not only in the actual execution, but previous to it, by furnishing him, intentionally, with poison,

arms, or the other means of perpetrating it. That sort of assistance which is not given till after the criminal act, and which is commonly called *abetting*, tho' it be of itself criminal, does not infer art and part of the principal crime; as if one should favour the escape of a criminal knowing him to be such, or conceal him from justice.

Law of  
Scotland.

6. Those crimes that are, in their consequences, most hurtful to society, are punished capitally, or by death; others escape with a lesser punishment, sometimes fixed by statute, and sometimes arbitrary, *i. e.* left to the discretion of the judge, who may exercise his jurisdiction, either by fine, imprisonment, or a corporal punishment. Where the punishment is left, by law, to the discretion of the judge, he can in no case extend it to death. The single offence of the criminal falls on conviction, in all capital trials, though the sentence should not express it.

Punish-  
ment of  
crimes.

7. Certain crimes are committed more immediately against God himself; others, against the state; and a third kind, against particular persons. The chief crime in the first class, cognisable by temporal courts, is *blasphemy*, under which may be included *atheism*. This crime consists in the denying or vilifying the Deity, by speech or writing. All who curse God or any of the persons of the blessed Trinity, are to suffer death, even for a single act; and those who deny him, if they persist in their denial. The denial of a Providence, or of the authority of the holy Scriptures, is punishable capitally for the third offence.

Blasphemy.

8. No prosecution can now be carried on for witchcraft or conjuration. But all who undertake, from their skill in any occult science, to *tell fortunes, or discover stolen goods*, are to suffer imprisonment for a year, stand in the pillory four times in that year, and find surety for their future good behaviour.

9. Some crimes against the state are levelled directly against the supreme power, and strike at the constitution itself: others discover such a contempt of law, as tends to baffle authority, or slacken the reins of government. *Treason, crimen majestatis*, is that crime which is aimed against the majesty of the state; and can be committed only by those who are subjects of that state either by birth or residence. Soon after the union of the two kingdoms in 1707, the laws of treason, then in force in England, were made ours by 7 Ann. c. 21. both with regard to the facts constituting that crime, to the forms of trial, the corruption of blood, and all the penalties and forfeitures consequent on it.

10. It is high treason, by the law of England, to imagine the death of the King, Queen-consort, or of the heir apparent of the crown; to levy war against the King, or adhere to his enemies; to counterfeit the king's coin, or his great or privy seal; to kill the chancellor, treasurer, or any of the 12 judges of England, while they are doing their offices: which last article is by the forenamed act 7 Ann. applied to Scotland, in the case of slaying any judge of the session or of judiciary sitting in judgment. Those who wash, clip, or lighten the proper money of the realm; who advisedly affirm by writing or printing, that the Pretender has any right to the crown, that the king and parliament cannot limit the succession to it, or who hold correspondence with the Pretender, or any person em-  
ployed

Law of  
Scotland.  
Pains of  
treason.

played by him, are also guilty of treason.

11. The forms of proceeding in the trial of treason, whether against peers or commoners, are set forth in a small treatise, published by order of the house of lords in 1709, subjoined to a collection of statutes concerning treason. By the conviction upon this trial, the whole estate of the traitor forfeits to the crown. His blood is also corrupted, so that, on the death of an ancestor, he cannot inherit; and the estate which he cannot take, falls to the immediate superior as escheat, *ob defectum heredis*, without distinguishing whether the lands hold of the crown, or of a subject. No attainer for treason shall, after the death of the Pretender and all his sons, hurt the right of any person, other than that of the offender, during his natural life; the rights of creditors and other third parties in the case of forfeiture on treason, must be determined by the law of England.

Misprison  
of treason.

12. *Misprison of treason*, from *naprendre*, is the overlooking or concealing of treason. It is inferred by one's bare knowledge of the crime, and not discovering it to a magistrate or other person intitled by his office to take examinations; though he should not in the least degree assent to it. The forefaid act 7 *An.* makes the English law of misprison ours. Its punishment is, by the law of England, perpetual imprisonment, together with the forfeiture of the offender's moveables, and of the profits of his heritable estate, during his life; that is, in the style of our law, his single and life-entail.

Sedition.

13. The crime of *sedition* consists in the raising commotions or disturbances in the state. It is either verbal or real. Verbal sedition, or leasing making, is inferred from the uttering of words tending to create discord between the king and his people. It is punished either by imprisonment, fine, or banishment, at the discretion of the judge. Real sedition is generally committed by convoking together any considerable number of people, without lawful authority, under the pretence of redressing some public grievance, to the disturbing of the public peace. Those who are convicted of this crime are punished by the confiscation of their goods; and their lives are at the king's will. If any persons, to the number of 12, shall assemble, and being required by a magistrate or constable to disperse, shall nevertheless continue together for an hour after such command, the persons disobeying shall suffer death and confiscation of moveables.

Corruption  
in judges.

14. Judges, who, wilfully or through corruption, use their authority as a cover to injustice or oppression, are punished with the loss of honour, fame, and dignity. Under this head may be classed *theftbote* (from *bote*, compensation), which is the taking a consideration in money or goods from a thief to exempt him from punishment, or connive at his escape from justice. A sheriff or other judge, guilty of this crime, forfeits his life and goods. And even a private person, who takes *theftbote*, suffers as the principal thief. The buying of disputed claims, concerning which there is a pending process, by any judge or member either of the session, or of an inferior court, is punished by the loss of the delinquent's office, and all the privileges thereto belonging.

Deforcement.

15. *Deforcement* is the opposition given, or resistance made, to messengers or other officers, while they

are employed in executing the law. The court of session is competent to this crime. It is punishable with the confiscation of moveables, the one half to the king, and the other to the creditor at whose suit the diligence was used. Armed persons, to the number of three or more, assisting in the illegal running, landing, or exporting of prohibited or uncustomed goods, or any who shall resist, wound, or maim any officer of the revenue in the execution of his office, are punishable with death and the confiscation of moveables.

16. *Breach of arrestment*, (see No lxxviii. 5.) is a Breach crime of the same nature with deforcement, as it imports a contempt of the law and of our judges. It subjects to an arbitrary corporal punishment, and the escheat of moveables; with a preference to the creditor for his debt, and for such farther sum as shall be modified to him by the judge. Under this head of crimes against good government and police, may be reckoned the *forfeiting of markets*; that is, the buying of Forest goods intended for a public market, before they are carried there; which for the third criminal act, infers the escheat of moveables; as also slaying salmon in forbidden time, destroying plough-graith in time of tillage, slaying or houghing horses or cows in time of harvest, and destroying or spoiling growing timber; as to the punishment of which, see statutes 1503, c. 72. — 1587, c. 82. and 1689, c. 16—1. *Geo. I. St. 2. c. 48.*

17. Crimes against particular persons may be directed either against life, limb, liberty, chastity, goods, or reputation. *Murder* is the wilful taking away of a person's life, without a necessary cause. Our law makes no distinction betwixt premeditated and sudden homicide; both are punished capitally. Casual homicide, where the actor is in some degree blameable; and homicide in self-defence, where the just bounds of defence have been exceeded; are punished arbitrarily; but the slaughter of night-thieves, house-breakers, assistants in masterful depredations, or rebels denounced for capital crimes, may be committed with impunity. The crime of *decomposition*, or the cutting off of a member, is joined with that of murder; but in practice, its punishment has been restricted to the escheat of moveables, and an assythment or indemnification to the party. *Mutilation*, or the disabling of a member, is punished at the discretion of the judge.

18. *Self-murder* is as highly criminal as the killing Self-murder our neighbour; and for this reason, our law has, contrary to the rule, *crimina morte extinguntur*, allowed a proof of the crime, after the offender's death, that his single escheat might fall to the king or his donatory. To this end, an action must be brought, not before the judiciary, but the session, because it is only intended *ad civilem effectum*, for proving and declaring the self-murder; and the next of kin to the deceased must be made a party to it.

19. The punishment of parricide, or of the murder of a parent, is not confined, by our law, to the criminal himself. All his posterity in the right line are declared incapable of inheriting; and the succession devolves on the next collateral heir. Even the cursing or beating of a parent infers death, if the person guilty be above 16 years; and an arbitrary punishment, if he be under it. A presumptive or statutory murder is constituted by 1690, c. 21. by which any woman who shall

Law  
Scotl.

Murder

Parricide

law of  
Scotland.

shall conceal her pregnancy, during its whole course, and shall not call for, or make use of help in the birth, is to be reputed the murderer, if the child be dead, or amissing. This act was intended to discourage the unnatural practice of women making away with their children begotten in fornication, to avoid church-censures.

elling.

20. *Duelling*, is the crime of fighting in single combat, on previous challenges given and received. Fighting in a duel, without licence from the king, is punishable by death; and whatever person, principal or second, shall give a challenge to fight a duel, or shall accept a challenge, or otherwise engage therein, is punished by banishment and escheat of moveables, though no actual fighting should ensue.

infuse.

21. *Hausfacken*, (from *haus*, home, and *facken*, to seek or pursue,) is the assaulting or beating of a person in his own house. The punishment of this crime is no where defined, except in the books of the Majesty, which make it the same as that of a rape; and it is, like rape, capital by our practice. The assault must be made in the proper house of the person assaulted, where he lies and rises daily and nightly, so that neither a public house, nor even a private, where one is only transiently, falls within the law.

tery.

22. Any party to a law-suit, who shall slay, wound, or otherwise invade his adversary, at any period of time between executing the summons and the complete execution of the decree, or shall be accessory to such invasion, shall lose his cause. The sentence pronounced on this trial, against him who has committed the battery, is not subject to reduction, either on the head of minority, or on any other ground whatever: and if the person prosecuted for this crime shall be denounced for not appearing, his liferent, as well as single escheat, falls upon the denunciation.

jougous  
ridious  
ht.

23. The crime of *wrongous imprisonment* is inferred, by granting warrants of commitment in order to trial, proceeding on informations not subscribed, or without expressing the cause of commitment; by receiving or detaining prisoners on such warrants; by refusing to a prisoner a copy of the warrant of commitment; by detaining him in close confinement, above eight days after his commitment; by not releasing him on bail, where the crime is bailable; and by transporting persons out of the kingdom, without either their own consent, or a lawful sentence. The persons guilty of a wrongous imprisonment, are punished by a pecuniary mulct, from L. 6000 down to L. 400 *Scots*, according to the rank of the person detained; and the judge, or other person guilty, is over and above subjected to pay to the person detained a certain sum *per diem*, proportioned to his rank, and is declared incapable of public trust. All these penalties may be insisted for by a summary action before the session, and are subject to no modification.

hultery.

24. *Adultery*, is the crime by which the marriage-bed is polluted. This crime could, neither by the Roman nor Jewish law, be committed, but where the guilty woman was the wife of another: by ours, it is adultery, if either the man or woman be married. We distinguish between simple adultery, and that which is notorious or manifest. Open and manifest adulterers, who continue incorrigible, notwithstanding the censures of the church, are punished capitally.

Law of  
Scotland.

This crime is distinguished by one or other of the following characters; where there is issue procreated between the adulterers; or where they keep bed and company together notoriously; or where they give scandal to the church, and are, upon their obstinate refusing to listen to their admonitions, excommunicated. The punishment of simple adultery, not being defined by statute, is left to the discretion of the judge; but custom has made the falling of the single escheat one of its penalties.

Bigamy.

25. *Bigamy*, is a person's entering into the engagements of a second marriage, in violation of a former marriage-vow still subsisting. Bigamy, on the part of the man, has been tolerated in many states, before the establishment of Christianity, even by the Jews themselves; but it is prohibited by the precepts of the gospel, and it is punished by our law, whether on the part of the man or of the woman, with the pains of perjury.

Incest.

26. *Incest*, is committed by persons who stand within the degrees of kindred forbidden in *Lev. xviii.* and is punished capitally. The same degrees are prohibited in affinity, as in consanguinity, *Lev. xviii. 13. et seq.* As this crime is repugnant to nature, all children, whether lawful or natural, stand on an equal footing: *civilis ratio civilia jura corrumpere potest, non vero naturalia*. It is difficult indeed to bring a legal proof of a relation merely natural, on the side of the father; but the mother may be certainly known without marriage.

Rape.

26. There is no explicit statute making rape, or the ravishing of women, capital; but it is plainly supposed in act 1612. c. 4. by which the ravisher is exempted from the pains of death, only in the case of the woman's subsequent consent, or her declaration that she went off with him of her own free-will; and even then, he is to suffer an arbitrary punishment, either by imprisonment, confiscation of goods, or a pecuniary fine.

Theft.

28. *Theft* is defined, A fraudulent intermeddling with the property of another, with a view of making gain. Our ancient law proportioned the punishment of the theft to the value of the goods stolen; heightening it gradually, from a slight corporal punishment to a capital, if the value amounted to thirty-two pennies Scots, which in the reign of David I. was the price of two sheep. In several latter acts, it is taken for granted, that this crime is capital. But where the thing stolen is of small value, we consider it, not as theft, but as pickery, which is punished either corporally or by banishment. The breaking of orchards, and the stealing of green wood, is punished by a fine, which rises as the crime is repeated.

29. Theft may be aggravated into a capital crime, though the value of the thing stolen be trifling; as theft twice repeated, or committed in the night, or by landed men; or of things set apart for sacred uses. The receivers and concealers of stolen goods, knowing of them to be such, suffer as thieves. Those who barely harbour the person of the criminal within 48 hours either before or after committing the crime, are punished as partakers of the theft. Such as sell goods belonging to thieves or lawless persons who dare not themselves come to market, are punished with banishment and the escheat of moveables.

Reset of  
theft.

30. Theft attended with violence is called *robbery*; and

Law of  
Scotland.  
Robbery,  
&c.

and in our old statutes, *rief* or *stouthrief*; under which clans may be included *forming*, or the taking of meat and drink by force, without paying for it. Stouthrief came at last to be committed so audaciously, by bands of men associated together, that it was thought necessary to vest all our freeholders with a power of holding courts upon forners and rieviers, and condemning them to death. Nay, all were capitally punished, who, to secure their lands from depredation, paid to the rieviers a yearly contribution, which got the name of *black-mail*. An act also passed, commanding to banishment a band of forners, who were originally from *Egypt*, called *gyffies*, and adjudging to death all that should be reputed *Egyptians*, if found thereafter within the kingdom. Robbery committed on the seas, is called *piracy*, and is punished capitally by the high admiral. Several of the facts which constitute this crime are set forth in a British statute, 8 Geo. I. c. 24.

Falschhood.

31. *Falschhood*, in a large sense, is the fraudulent imitation or suppression of truth, to the damage of another. The lives and goods of persons convicted of using false weights or measures were, by our old law, in the king's mercy; and their heirs could not inherit but upon a remission. The latest statute against this crime, punishes it by confiscation of moveables. That particular species of falschhood, which consists in the falsifying of writings, passes by the name of *forgery*. Our practice has now of a long time, agreeably to the Roman law, made this crime capital; unless the forgery be of executions, or other writings of smaller moment; in which case, it is punished arbitrarily.

Forgery.

32. The writing must not only be fabricated, but put to use or founded on, in order to infer this crime. And though it be strictly criminal, yet the trial of it is proper to the court of session; but where improbation is moved against a deed by way of exception, the inferior judge, before the action lies, is competent to it *ad civilem effectum*. When it is pleaded as an exception, our practice, to discourage affected delays, obliges the defender, who moves it, to consign L. 40 Scots; which he forfeits, if his plea shall appear calumnious.

33. Where a person, found guilty of forgery by the court of session, is by them remitted to the judiciary, an indictment is there exhibited against him, and a jury sworn, before whom the decree of session is produced, in place of all other evidence of the crime, in respect of which the jury find the panel guilty; so that that decree being pronounced by a competent court, is held as full proof, or, in the style of the bar, as *probatio probata*.

Perjury.

34. *Perjury*, which is the judicial affirmation of a falsehood on oath, really constitutes the *crimen falsi*; for he who is guilty of it does, in the most solemn manner, substitute falsehood in the place of truth. To constitute this crime, the violation of truth must be deliberately intended by the swearer; and therefore reasonable allowances ought to be given to forgetfulness or misapprehension, according to his age, health, and other circumstances. The breach of a promissory oath does not infer this crime; for he who promises on oath, may sincerely intend performance when he swears, and so cannot be said to call on God to attest a falsehood. Though an oath, however false, if made upon reference in a civil question, concludes the cause, the

person perjured is liable to a criminal trial; for the effect of the reference can go no further than the private right of the parties.

Law  
Scotl

35. Notwithstanding the mischievous consequences of perjury to society, it is not punished capitally, but by confiscation of moveables, imprisonment for a year, and infamy. The court of session is competent to perjury *incidenter*, when in any examination upon oath, taken in a cause depending before them, a person appears to have sworn falsely; but in the common case, that trial is proper to the judiciary. *Subornation of perjury* consists in tampering with persons who are to swear in judgment, by directing them how they are to depose; and it is punished with the pains of perjury.

36. The crime of *stellionate*, from *stellio*, includes *Stellio* every fraud which is not distinguished by a special name; but is chiefly applied to conveyances of the same numerical right, granted by the proprietor to different disponees. The punishment of stellionate must necessarily be arbitrary, to adapt it to the various natures and different aggravations of the fraudulent acts. The persons guilty of that kind of it, which consists in granting double conveyances, are by our law declared infamous, and their lives and goods at the king's mercy. The cognizance of *fraudulent bankruptcy* is appropriated to the court of session, who may inflict any punishment on the offender, that appears proportioned to his guilt, death excepted.

37. The crime of *usury*, before the reformation, *Usury* consisted in the taking of any interest for the use of money; and now in taking an higher rate of interest than is authorized by law. It is divided into *usura manifesta*, or direct; and *velata*, or covered. One may be guilty of the first kind, either where he covenants with the debtor for more than the lawful interest on the loan-money; or where one receives the interest of a sum before it is due, since thereby he takes a consideration for the use of money before the debtor has really got the use of it. Where a debt is clogged with an uncertain condition, by which the creditor runs the hazard of losing his sum, he may covenant for an higher interest than the legal, without the crime of usury; for there, the interest is not given merely in consideration of the use of the money, but of the danger undertaken by the creditor.

38. Covered usury, is that which is committed under the mask, not of a loan, but of some other contract; e. g. a sale, or an improper wadset. And in general, all obligations entered into with an intention of getting more than the legal interest for the use of money, however they may be disguised, are usurious. As a farther guard against this crime, the taking more than the legal interest for the forbearance of payment of money, merchandise, or other commodities, by way of loan, exchange, or other contrivance whatever, or the taking a bribe for the loan of money, or for delaying its payment when lent, is declared usury. Where usury is proved, the usurious obligation is not only declared void, but the creditor, if he has received any unlawful profits, forfeits the treble value of the sums or goods lent. Usury, when it is to be pursued criminally, must be tried by the judiciary; but where the libel concludes only for voiding the debt or restitution, the session is the proper court.

law of  
Scotland.

ary.

39. *Injury*, in its proper acceptation, is the reproaching or affronting our neighbour. Injuries are either verbal or real. A verbal injury, when directed against a private person, consists in the uttering contumelious words, which tend to expose our neighbour's character by making him little or ridiculous. It does not seem that the twitting one with natural defects, without any farcical reflections, though it be inhuman, falls under this description, as these imply no real reproach in the just opinion of mankind. Where the injurious expressions have a tendency to blacken one's moral character, or fix some particular guilt upon him, and are deliberately repeated in different companies, or handed about in whispers to confidants, it then grows up to the crime of slander: and where a person's moral character is thus attacked, the *animus injuriandi* is commonly inferred from the injurious words themselves, unless special circumstances be offered to take off the presumption; *ex. gr.* that the words were uttered in judgement in one's own defence, or by way of information to a magistrate, and had some foundation in fact. Though the cognizance of slander is proper to the commissaries, who, as the *judices Christianitatis*, are the only judges of scandal; yet for some time past, bare verbal injuries have been tried by other criminal judges, and even by the Session. It is punished either by a fine, proportioned to the condition of the persons injuring and injured, and the circumstances of time and place; or if the injury import scandal, by publicly acknowledging the offence; and frequently the two are conjoined. The calling one a bankrupt is not, in strict speech, a verbal injury, as it does not affect the person's moral character; yet as it may hurt his credit in the way of business, it founds him in an action of damages, which must be brought before the judge-ordinary. A real injury is inflicted by any fact by which a person's honour or dignity is affected; as striking one with a cane, or even aiming a blow without striking; spitting in one's face; assuming a coat of arms, or any other mark of distinction proper to another, &c. The composing and publishing defamatory libels may be reckoned of this kind. Real injuries are tried by the judge-ordinary, and punished either by fine or imprisonment, according to the demerit of the offenders.

criminal  
jurisdiction.

40. After having shortly explained the several crimes punishable by our law, this treatise may be concluded with a few observations on criminal jurisdiction, the forms of trial, and the methods by which crimes may be extinguished. Criminal jurisdiction is founded, 1. *Ratione domicilii*, if the defender dwells within the territory of the judge. Vagabonds, who have no certain *domicile*, may be tried wherever they are apprehended. 2. *Ratione delicti*, if the crime was committed within the territory. Treason is triable, by the English law, in any county that the king should appoint; and, by a temporary act now expired, treason committed in certain Scots counties, was made triable by the court of Justiciary, wherever it should sit.

that per-  
sons are not  
able.

41. No criminal trial can proceed, unless the person accused is capable of making his defence. Absents therefore cannot be tried; nor fatuous nor furious persons, *durante furore*, even for crimes committed while they were in their senses. For a like reason,

minors who had no curators, could not, by the Roman law, be tried criminally; but our practice considers every person who is capable of dolo, to be also sufficiently qualified for making his defence in a criminal trial.

Commit-  
ment.

42. No person can be imprisoned in order to stand trial for any crime, without a warrant in writing expressing the cause, and proceeding upon a subscribed information, unless in the case of indignities done to judges, riots, and the other offences specially mentioned in 1701, c. 6. Every prisoner committed in order to trial, if the crime of which he is accused be not capital, is entitled to be released upon bail, the extent of which is to be modified by the judge, not exceeding 12,000 merks Scots for a nobleman, 6000 for a landed gentleman, 2000 for every other gentleman or burgher, and 600 for any other inferior person. That persons who, either from the nature of the crime with which they are charged, or from their low circumstances, cannot procure bail, may not lie for ever in prison untried, it is lawful for every such prisoner, to apply to the criminal judge, that his trial may be brought on. The judge must, within 24 hours after such application, issue letters directed to messengers, for intimating to the prosecutor to fix a diet for the prisoner's trial, within 60 days after the intimation, under the pain of wrongous imprisonment: And if the prosecutor does not insist within that time, or if the trial is not finished in forty days more when carried on before the Justiciary, or in thirty when before any other judge; the prisoner is, upon a second application, setting forth that the legal time is elapsed, entitled to his freedom, under the same penalty.

43. Upon one's committing any of the grosser crimes, it is usual for a justice of the peace, sheriff, or other judge, to take a precognition of the facts, *i. e.* to examine those who were present at the criminal act, upon the special circumstances attending it, in order to know whether there is ground for a trial, and to serve as a direction to the prosecutor, how to set forth the facts in the libel; but the persons examined may insist to have their declarations cancelled, before they give testimony at the trial. Justices of the peace, sheriffs, and magistrates of boroughs, are also authorized to receive informations, concerning crimes to be tried in the circuit-courts; which informations are to be transmitted to the justice-clerk 40 days before the sitting of the respective courts. To discourage groundless criminal trials, all prosecutors, where the defender was absolved, were condemned by statute, in costs, as they should be modified by the judge, and besides were subjected to a small fine, to be divided between the sile and the defender: And where the king's advocate was the only pursuer, his informer was made liable. This sufficiently warrants the present practice of condemning vexatious prosecutors in a pecuniary mulct, though far exceeding the statutory sum.

44. The forms of trial upon criminal accusations, differ much from those observed in civil actions, if we trial, except the case of such crimes as the court of Session is competent to, and of lesser offences tried before inferior courts. The trial of crimes proceeds, either upon indictment, which is sometimes used when the person to be tried is in prison; or by criminal letters issuing

from

Law of  
Scotland.

from the signet of the Justiciary. In either case, the defender must be served with a full copy of the indictment of letters, and with a list of the witnesses to be brought against him, and of the persons who are to pass on the inquest, and 15 free days must intervene between his being so served, and the day of appearance. When the trial proceeds upon criminal letters, the private prosecutor must give security, at raising the letters, that he will report them duly executed to the Justiciary, in terms of 1535, c. 35.; and the defender, if he be not already in prison, is, by the letters, required to give caution, within a certain number of days after his citation, for his appearance upon the day fixed for his trial: And if he gives none within the days of the charge, he may be denounced rebel, which infers the forfeiture of his moveables.

45. That part of the indictment, or of the criminal letters, which contains the ground of the charge against the defender, and the nature or degree of the punishment he ought to suffer, is called the *libel*. All libels must be special, setting forth the particular facts inferring the guilt, and the particular place where these facts were done. The time of committing the crime may be libelled in more general terms, with an alternative as to the month, or day of the month: but as it is not practicable, in most cases, to libel upon the precise circumstances of accession that may appear in proof, libels against accessories are sufficient, if they mentioned, in general, that the persons prosecuted are guilty art and part.

46. The defender, in a criminal trial, may raise letters of exculpation, for citing witnesses in proof of his defences against the libel, or of his objections against any of the jury or witnesses; which must be executed to the same day of appearance with that of the indictment or criminal letters.

Diets of  
appearance.

47. The diets of appearance, in the court of Justiciary, are peremptory: the criminal letters must be called on the very day to which the defender is cited; and hence, if no accuser appears, their effect is lost, *instantia perit*, and new letters must be raised. If the libel, or any of the executions, shall to the prosecutor appear informal, or if he be diffident of the proof, from the absconding of a necessary witness, the court will, upon a motion made by him, desert the diet *pro loco et tempore*; after which new letters become also necessary. A defender, who does not appear on the very day to which he is cited, is declared fugitive; in consequence of which, his single efcheat falls. The defender, after his appearance in court, is called the *pannel*.

48. The two things to be chiefly regarded in a criminal libel, are, 1. The relevancy of the facts, *i. e.* their sufficiency to infer the conclusion; 2. Their truth. The consideration of the first belongs to the judge of the facts; that of the other, to the jury or assize. If the facts libelled be found irrelevant, the pannel is dismissed from the bar; if relevant, the court remits the proof thereof to be determined by the jury; which must consist of 15 men picked out by the court from a greater number not exceeding 45, who have been all summoned, and given in list to the defender at serving him with a copy of the libel.

Probation  
of crimes.

49. Crimes cannot, like debts, be referred to the defender's oath; for no person is compellable to swear

Law of  
Scotland.

against himself, where his life, limb, liberty, or estate is concerned, nor even in crimes which infer infamy; because one's good name is, in right estimation, as valuable as his life. There is one exception however to this rule in trying the crime of usury, which may be proved by the usurer's own oath, notwithstanding the rule, *nemo tenetur jurare in suam turpitudinem*. Crimes therefore are in the general case proveable only by the defender's free confession, or by writing, or by witnesses. No extrajudicial confession, unless it is adhered to by the pannel in judgment, can be admitted as evidence.

50. All objections relevant against a witness in civil *Socci crim* cases are also relevant in criminal. No witness is admitted, who may gain or lose by the event of the trial. *Socci criminis*, or associates in the same crime, are not admitted against one another, except either in crimes against the state, as treason; in occult crimes, where other witnesses cannot be had, as forgery; or in thefts or depredations committed in the Highlands. The testimony of the private party injured may be received against the pannel, where the king's advocate is the only prosecutor, if, from the nature of the crime, there must needs be a penalty of witnesses, as in rape, robbery, &c.

51. After all the witnesses have been examined in court, the jury are shut up in a room by themselves, where they must continue, excluded from all correspondence, till their verdict or judgment be subscribed by the foreman (or chancellor), and clerk; and according to this verdict the court pronounces sentence, either absolving or condemning. It is not necessary, by the law of Scotland, that a jury should be unanimous in finding a person guilty; the narrowest majority is as sufficient against the pannel, as for him. Juries cannot be punished on account of an erroneous verdict, either for or against the pannel.

52. Though the proper business of a jury be to inquire into the truth of the facts found relevant by the court, for which reason they are sometimes called the *inquest*; yet, in many cases, they judge also in matters of law or relevancy. Thus, though an objection against a witness should be repelled by the court, the jury are under no necessity to give more credit to his testimony than they think just: And in all trials of art and part, where special facts are not libelled, the jury, if they return a general verdict, are indeed judges not only of the truth, but of the relevancy of the facts that are sworn to by the witnesses. A general verdict, is that which finds in general terms, that the pannel is guilty or not guilty, or that the libel or defences are proved or not proved. In a special verdict, the jury finds certain facts proved, the import of which is to be afterwards considered by the court.

53. Criminal judges must now suspend for some Sentence time the execution of such sentences as affect life or limb, that so condemned criminals, whose cases deserve favour, may have access to apply to the king for mercy. No sentence of any court of judicature, south of the river Forth, importing either death or demembration, can be executed in less than 30 days; and, if north of it, in less than 40 days, after the date of the sentence. But corporal punishments, less than death or dismembering, *e. g.* whipping, pillory, &c. may be inflicted eight days after sentence on this side Forth, and

Verdict  
assize.Power  
of a jury.

Law of Scotland.

distinction crimes.

and twelve days after sentence beyond it.

54. Crimes are extinguished, 1. By the death of the criminal; both because a dead person can make no defence, so that his trial is truly a judging upon the hearing of one side; and because, though his guilt should be ever so notorious, he is after death carried beyond the reach of human penalties: Such trials therefore can have no effect, but to punish the innocent heir, contrary to that most equitable rule, *culpa tenet suos auctores*. 2. Crimes may be extinguished by a remission from the sovereign. But a remission, tho' it secures the delinquent from the public resentment, the exercise of which belongs to the Crown, cannot cut off the party injured from his claim of damages, over which the crown has no prerogative. Whoever therefore founds on a remission, is liable in damages to the private prosecutor, in the same manner as if he had been tried and found guilty. Even general acts of indemnity passed in parliament, though they secure against such penalties as law inflicts upon the criminal merely *per modum pene*, yet do not against the payment of any pecuniary fine that is given by statute to the party injured, nor against the demand of any claim competent to him in name of damages.

55. Lesser injuries, which cannot be properly said to affect the public peace, may be extinguished, either by the private party's expressly forgiving him, or by his being reconciled to the offender, after receiving the injury. Hence arises the rule, *diffimulatione tollitur injuria*. But where the offence is of a higher nature, the party injured, though he may pass from the prosecution, in so far as his private interest is concerned, cannot preclude the king's advocate, or procurator.

fiscal, from inflicting *ad studium publicum*.

56. Crimes are also extinguished by prescription, which operates by the mere lapse of time, without any act either of the sovereign or of the private sufferer. Crimes prescribe in 20 years; but in particular crimes, the prescription is limited by statute to a shorter time. No person can be prosecuted upon the act against wrongous imprisonment, after three years. High treason, committed within his Majesty's dominions, suffers likewise a triennial prescription, if indictment be not found against the traitor within that time. All actions brought upon any penal statute made or to be made, where the penalty is appropriated to the crown, expire in two years after committing the offence; and where the penalty goes to the Crown or other prosecutor, the prosecutor must sue within one year, and the Crown within two years after the year ended. Certain crimes are, without the aid of any statute, extinguished by a shorter prescription than 20 years. By our old law, in the cases of rape, robbery, and hamefucken, the party injured was not heard, after a silence of 24 hours; from a presumption, that persons could not be so grossly injured, without immediately complaining: And it is probable, that a prosecution for these crimes, if delayed for any considerable time, would be cast even at this day, or at least the punishment restricted. Lesser injuries suffer also a short prescription; law *presuming* forgiveness, from the nature of the offence, and the silence of the party. The particular space of time sufficient to establish this presumption must be determined by the judge, according to circumstances.

Prescription.

Law of Scotland.

## L A W

**LAW-Language.** In England all law-proceedings were formerly written, as indeed all public proceedings were, in Norman or law French, and even the arguments of the counsel and decisions of the court were in the same barbarous dialect. An evident and shameful badge, it must be owned, of tyranny and foreign servitude; being introduced under the auspices of William the Norman, and his sons: whereby the observation of the Roman satyrists was once more verified, that *Gallia caudicibus docuit facunda Britannos*. This continued till the reign of Edward III.; who, having employed his arms successfully in subduing the crown of France, thought it unbecoming the dignity of the victors to use any longer the language of a vanquished country. By a statute therefore, passed in the 36th year of his reign, it was enacted, that for the future all pleas should be pleaded, shewn, defended, answered, debated, and judged, in the English tongue; but be entered and enrolled in Latin: In like manner as Don Alonso X. king of Castile (the great-grandfather of our Edward III.) obliged his subjects to use the Castilian tongue in all legal proceedings; and as, in 1286, the German language was established in the courts of the empire. And perhaps, if our legislature had then directed that the writs themselves, which are mandates from the king to his subjects to perform certain acts or to appear at certain places, should have been framed in the English language, according to the rule of our ancient law, it had not been very improper. But the record or enrollment of those writs and the proceed-

## L A W

ings thereon, which was calculated for the benefit of posterity, was more serviceable (because more durable) in a dead and immutable language than in any flux or living one. The practisers however, being used to the Norman language, and therefore imagining they could express their thoughts more aptly and more concisely in that than in any other, still continued to take their notes in law French; and of course, when those notes came to be published, under the denomination of *reports*, they were printed in that barbarous dialect; which, joined to the additional terrors of a Gothic black letter, has occasioned many a student to throw away his Plowden and Littleton, without venturing to attack a page of them. And yet in reality, upon a nearer acquaintance, they would have found nothing very formidable in the language; which differs in its grammar and orthography as much from the modern French, as the diction of Chaucer and Gower does from that of Addison and Pope. Besides, as the English and Norman languages were concurrently used by our ancestors for several centuries together, the two idioms have naturally assimilated, and mutually borrowed from each other: for which reason the grammatical construction of each is so very much the same, that I apprehend an Englishman (with a week's preparation) would understand the laws of Normandy, collected in their *grand coutumier*, as well if not better than a Frenchman bred within the walls of Paris.

The Latin, which succeeded the French for the entry and enrollment of pleas, and which continued in

See 9. comment.

Law-  
Language.

use for four centuries, answers so nearly to the English (oftentimes word for word) that it is not at all surprising it should generally be imagined to be totally fabricated at home, with little more art or trouble than by adding Roman terminations to English words. Whereas in reality it is a very universal dialect, spread throughout all Europe at the irruption of the northern nations; and particularly accommodated and moulded to answer all the purposes of the lawyers with a peculiar exactness and precision. This is principally owing to the simplicity, or (if the reader pleases) the poverty and baldness of its texture, calculated to express the ideas of mankind just as they arise in the human mind, without any rhetorical flourishes, or perplexed ornaments of style: for it may be observed, that those laws and ordinances, of public as well as private communities, are generally the most easily understood, where strength and perspicuity, not harmony or elegance of expression, have been principally consulted in compiling them. These northern nations, or rather their legislators, tho' they resolved to make use of the Latin tongue in promulging their laws, as being more durable and more generally known to their conquered subjects than their own Teutonic dialects, yet (either thro' choice or necessity) have frequently intermixed therein some words of a Gothic original; which is, more or less, the case in every country of Europe, and therefore not to be imputed as any peculiar blemish in our English legal latinity. The truth is, what is generally denominated *law-Latin* is in reality a mere technical language, calculated for eternal duration, and easy to be apprehended both in present and future times; and on those accounts best suited to preserve those memorials which are intended for perpetual rules of action. The rude pyramids of Egypt have endured from the earliest ages, while the more modern and more elegant structures of Attica, Rome, and Palmyra, have sunk beneath the stroke of time.

As to the objection of locking up the law in a strange and unknown tongue, this is of little weight with regard to records; which few have occasion to read, but such as do, or ought to, understand the rudiments of Latin. And besides, it may be observed of the law-Latin, as the very ingenious Sir John Davis observes of the law-French, "that it is so very easy to be learned, that the meanest wit that ever came to the study of the law doth come to understand it almost perfectly in ten days without a reader."

It is true indeed, that the many terms of art, with which the law abounds, are sufficiently harsh when Latinized (yet not more so than those of other sciences), and may, as Mr Selden observes, give offence "to some grammarians of squeamish stomachs, who would rather choose to live in ignorance of things the most useful and important, than to have their delicate ears wounded by the use of a word, unknown to Cicero, Sallust, or the other writers of the Augustan age." Yet this is no more than must unavoidably happen when things of modern use, of which the Romans had no idea, and consequently no phrases to express them, come to be delivered in the Latin tongue. It would puzzle the most classical scholar to find an appellation, in his pure Latinity, for a constable, a record, or a deed of feoffment: it is therefore to be imputed as much to necessity, as ignorance, that they were styled

in our forensic dialect, *constabularius*, *recordum*, and *feoffamentum*. Thus again, another uncouth word of our ancient laws (for I defend not the ridiculous barbarisms sometimes introduced by the ignorance of modern practisers) the substantive *murdrum*, or the verb *murdrare*, however harsh and unclassical it may seem, was necessarily framed to express a particular offence; since no other word in being, *occidere*, *interficere*, *ne-care*, or the like, was sufficient to express the intention of the criminal, or *quo animo* the act was perpetrated; and therefore by no means came up to the notion of murder at present entertained by our law; viz. a killing *with malice aforethought*.

A similar necessity to this produced a similar effect at Byzantium, when the Roman laws were turned into Greek for the use of the oriental empire: for, without any regard to Attic elegance, the lawyers of the imperial courts made no scruple to translate *fidei commissarios*, *φιδικομμισησιους*; *cubiculum*, *κυβικαλιον*; *filium-familias*, *φιδικοφωμυλιαριος*; *repudium*, *ρεπυδιον*; *compromissum*, *κομπρωμισησιον*; *reverentia et obsequium*, *μυριετιχη και σεβασμιος*; and the like. They studied more the exact and precise import of the words, than the neatness and delicacy of their cadence. And it may be suggested, that the terms of the law are not more numerous, more uncouth, or more difficult to be explained by a teacher, than those of logic, physics, and the whole circle of Aristotle's philosophy; nay, even of the politer arts of architecture and its kindred studies, or the science of rhetoric itself. Sir Thomas More's famous legal question contains in it nothing more difficult, than the definition which in his time the philosophers currently gave of their *materia prima*, the groundwork of all natural knowledge; that it is *neque quid, neque quantum, neque quale, neque aliquid eorum quibus est determinatur*; or its subsequent explanation by Adrian Heereboord, who assures us, that *materia prima non est corpus, neque per formam corporeitatis, neque per simplicem essentiam: est tamen ens, et quidem substantia, licet incompleta; habetque actum ex se entitativum, et simul est potentia subjectiva*. The law therefore, with regard to its technical phrases, stands upon the same footing with other studies, and requests only the same indulgence.

This technical Latin continued in use from the time of its first introduction, till the subversion of our ancient constitution under Cromwell; when, among many other innovations in the law, some for the better and some for the worse, the language of our records was altered and turned into English. But, at the restoration of king Charles, this novelty was no longer countenanced; the practisers finding it very difficult to express themselves so concisely or significantly in any other language but the Latin. And thus it continued without any sensible inconvenience till about the year 1730, when it was again thought proper that the proceedings at law should be done into English, and it was accordingly so ordered by statute 4 Geo. II. c. 26. This was done, in order that the common people might have knowledge and understanding of what was alleged or done for and against them in the process and pleadings, the judgment and entries in cause. Which purpose it is doubtful how well it has answered; but there is reason to suspect, that the people are now, after many years experience, altogether as ignorant in matters of law as before.

Language.

fore. On the other hand, these inconveniences have already arisen from the alteration; that now many clerks and attorneys are hardly able to read, much less to understand, a record even of so modern a date as the reign of George I. And it has much enhanced the expence of all legal proceedings: for since the practitioners are confined (for the sake of the stamp-duties, which are thereby considerably increased) to write only a stated number of words in a sheet; and as the English language, through the multitude of its particles, is much more verbose than the Latin; it follows that the number of sheets must be very much augmented by the change. The translation also of technical phrases, and the names of writs and other process, were found to be so very ridiculous (a writ of *nisi prius*, *quare impedit*, *seri faciar*, *habeas corpus*, and the rest, not being capable of an English dress with any degree of seriousness) that in two years time a new act was obliged to be made, 6 Geo. II. c. 14. which allows all technical words to continue in the usual language, and has thereby defeated every beneficial purpose of the former statute.

*Trial by Wager of Law*, (*vaditatio legis*;) a species of trial, in the English law, so called, as another species is styled "wager of battel," *vaditatio duelli*, (see *BATTEL*): because, as in the wager of battel, the defendant gave a pledge, gage, or *vadum*, or try the cause by battel; so here he was put in sureties or *vadors*, that at such a day he will make his law, that is, take the benefit which the law has allowed him, (see the article *TRIAL*.) For our ancestors considered, that there were many cases where an innocent man, of good credit, might be overborne by a multitude of false witnesses; and therefore established this species of trial, by the oath of the defendant himself: for if he will absolutely swear himself not chargeable, and appears to be a person of reputation, he shall go free, and for ever acquitted of the debt, or other cause of action.

The manner of waging and making law is this. He that has waged, or given security, to make his law, brings with him into court eleven of his neighbours: a custom, which we find particularly described so early as in the league between Alfred and Guthrum the Dane; for by the old Saxon constitution every man's credit in courts of law depended upon the opinion which his neighbours had of his veracity. The defendant then, standing at the end of the bar, is admonished by the judges of the nature and danger of a false oath. And if he still persists, he is to repeat this or the like oath: "Hear this, ye justices, that I do not owe unto Richard Jones the sum of ten pounds, nor any penny thereof, in manner and form as the said Richard hath declared against me. So help me God." And thereupon his eleven neighbours or compurgators shall avow upon their oaths, that they believe in their consciences that he saith the truth; so that himself must be sworn *de fidelitate*, and the eleven *de credulitate*.

In the old Swedish or Gothic constitution, wager of law was not only permitted, as it is in criminal cases, unless the fact be extremely clear against the prisoner; but was also absolutely required, in many civil cases: which an author of their own very justly charges as being the source of frequent perjury. This, he tells us, was owing to the Popish ecclesiastics, who

introduced this method of purgation from their canon law; and, having sown a plentiful crop of oaths in all judicial proceedings, reaped afterwards an ample harvest of perjuries: for perjuries were punished in part by pecuniary fines, payable to the coffers of the church. But with us in England wager of law is never required; and then only admitted, where an action is brought upon such matters as may be supposed to be privately transacted between the parties, and wherein the defendant may be presumed to have made satisfaction without being able to prove it. Therefore it is only in actions of debt upon simple contract, or for amercement, in actions of detinue, and of account, where the debt may have been paid, the goods restored, or the account balanced, without any evidence of either. And by such wager of law (when admitted) the plaintiff is perpetually barred; for the law, in the simplicity of the ancient times, presumed that no one would forswear himself for any worldly thing. Wager of law, however, lieth in a real action, where the tenant alleges he was not legally summoned to appear, as well as in mere personal contracts.

The wager of law was never permitted but where the defendant bore a fair and unapproachable character; and it was also confined to such cases where a debt might be supposed to be discharged, or satisfaction made in private, without any witnesses to attest it: and many other prudential restrictions accompanied this indulgence. But at length it was considered, that (even under all its restrictions) it threw too great a temptation in the way of indigent or profligate men: and therefore by degrees new remedies were devised, and new forms of action were introduced, wherein no defendant is at liberty to wage his law. So that now no plaintiff need at all apprehend any danger from the hardihood of his debtor's conscience, unless he voluntarily chooses to rely on his adversary's veracity, by bringing an obsolete, instead of a modern, action. Therefore, one shall hardly hear at present of an action of debt brought upon a simple contract: that being supplied by an action of *trespass on the case* for the breach of a promise or *assumpsit*; wherein, though the specific debt cannot be recovered, yet damages may, equivalent to the specific debt. And, this being an action of trespass, no law can be waged therein. So, instead of an action of *detinue* to recover the very thing detained, an action of trespass on the case in *trover* and *conversion* is usually brought; wherein, though the horse or other specific chattel cannot be had, yet the defendant shall pay damages for the conversion, equal to the value of the chattel; and for this trespass also no wager of law is allowed. In the room of actions of account a bill in equity is usually filed: wherein, though the defendant answers upon his oath, yet such oath is not conclusive to the plaintiff; but he may prove every article by other evidence, in contradiction to what the defendant has sworn. So that wager of law is quite out of use, being avoided by the mode of bringing the action; but still it is not out of force. And therefore, when a new statute inflicts a penalty, and gives an action of debt for recovering it, it is usual to add, "in which no wager of law shall be allowed;" otherwise an hardy delinquent might escape any penalty of the law, by swearing he had never incurred, or else had discharged it.

*Custom-House LAWS.* The expedient of exacting duties on goods imported, or exported, has been adopted by every commercial nation in Europe. The attention of the British legislature has not been confined to the object of raising a revenue alone, but they have attempted, by duties, exemptions, drawbacks, bounties, and other regulations, to direct the national trade into those channels that contribute most to the public benefit. And, in order to obtain every requisite information, all goods, exported or imported, whether liable to duty or not, are required to be entered at the respective custom-houses; and, from these entries, accounts are regularly made up of the whole British trade, distinguishing the articles, their quantity and value, and the countries which supply or receive them.

The objects of the British legislature may be reduced to the following heads :

First, To encourage the employment of British shipping and seamen, for the purpose of supplying our navy when public exigencies require.

Secondly, To increase the quantity of money in the nation, by prohibiting the exportation of British coin, by encouraging exportation, and discouraging importation, and by promoting agriculture, fisheries, and manufactures. For these purposes, it is penal to entice certain manufacturers abroad, or export the tools used in their manufactures; the exportation of raw materials is, in most instances, prohibited; and their importation permitted free from duty, and sometimes rewarded with a bounty. The exportation of some goods, manufactured to a certain length only, (for example white cloth), is loaded with a duty, but permitted duty-free when the manufacture is carried to its full extent. The importation of rival manufactures is loaded with heavy duties, or absolutely prohibited. These restrictions are most severe towards nations with which the balance of trade is supposed against us, or which are considered as our most formidable rivals in power or commerce.

Thirdly, To secure us plenty of necessaries for subsistence and manufacture, by discouraging the exportation of some articles that consume by length of time, and regulating the corn-trade according to the exigencies of the seasons.

Fourthly, To secure the trade of the colonies to the mother-country, and preserve a mutual intercourse, by encouraging the produce of their staple-commodities, and restraining their progress in these manufactures which they receive from us in exchange.

To accomplish these ends, a very complex system of laws has been enacted; the outlines of which we shall lay before the reader. How far the means have contributed to the ends proposed, and how far these ends themselves are always wise; or, whether a trade encumbered by fewer restrictions, would not prove more beneficial, as well as more extensive, may perhaps be called in question: but the discussion of this belongs not to our plan.

1. REGULATIONS concerning IMPORTATION.] The foundation of our commercial regulations is the famous act of navigation, which was first enacted during the time of the commonwealth, and adopted by the first parliament after the restoration. The substance of this act, and subsequent amendments, relating to goods imported, is as follows.

Goods from Asia, Africa, and America, may not be imported, except in British ships duly navigated, or ships belonging to the British plantations; and they can only be imported from the place of their production or manufacture, or the port where they are usually first shipped for transportation :

Except goods from the Straights and Levant, which may be brought from the usual places of lading in British ships; goods brought from Persia, by persons free of the Russia Company, in barter for British goods sent to Russia; and from thence by land-carriage to Persia, and Persian raw silk, any how purchased, imported from Russia in British ships; goods of the Spanish or Portuguese plantations, imported from Spain or Portugal in British ships; gum-senega, from Europe, in British ships; bullion, cochineal, and indigo; spice, by licence; coarse printed calicoes, cawries, and arranges, for the African market, by licence; and goods taken as prize.

The restriction on European goods is not universal, but extends to several of the bulkiest articles. Russian goods, masts, timber, boards, salt, pitch, rosin, tar, hemp, flax, raisins, figs, prunes, olives, oil, corn, sugar, potashes, wine, and vinegar, may not be imported, except in ships belonging to Great Britain or Ireland, legally manned; nor Turkey goods and currents, except in ships British built; or in ships belonging to the country where these goods are produced, or manufactured, or first shipped for exportation; and, if imported in foreign ships, they pay alien's duty.

In order to entitle a ship to the privileges of a British ship, it must belong entirely to British subjects; and the master, and three fourths of the mariners, must be British subjects, except in case of death, or unavoidable accidents. Corn may be exported, and entitled to bounty, if the master and two thirds of the mariners be British subjects. In time of war, the proportion of British mariners required is generally confined to one fourth; and the same proportion only is required in the Greenland fishery. Wool may not be exported to Ireland, except in ships wholly manned by British. Ships foreign built, though belonging to British, are subject to the same duties as ships belonging to foreigners. Ships employed in the Newfoundland fishery must carry one fresh man, (i. e. who has not been at sea before), in five.

In order to prevent a ship from being deprived of the privileges belonging to British ships, no foreigner may purchase a share without consent of three-fourths of the owners. Ships foreign built must be registered, and oath made concerning the property, before they be admitted to the privilege of British ships.

Commanders of ships of war must not allow any merchant-goods to be taken on board, unless by order of the admiralty, or goods taken out of ships in distress, under pain of being cashiered. In these cases, they must report the goods on board, and submit to the same regulations that merchant-ships are subject to.

No merchant-goods may be imported or exported in any packet-boat, unless with the consent of the chief officers of the customs.

*Prohibited goods.* The importation of cattle, beef, mutton,

Custom-house Laws.  
mutton, and port, except from Ireland, is declared a public nuisance. These articles are ordered to be seized at all hands, the cattle to be slain, and distributed among the poor, reserving the hides and tallow to the seizer; and the parish is liable in penalties, if the seizer be neglected.

The following goods are prohibited, and the importers and venders are liable in penalties, from L. 200 to L. 50: and the goods, in some cases, are appointed to be burned; in others, to be sold for exportation. Gold and silver thread, lace, fringe, or other work, or work of copper, brass, or any inferior metal; gold or silver wire, lace, brocade, embroidery. Needle-work of thread or silk, except East India fringes of thread and silk; bone-lace of thread or silk, except of Flanders; cut-work, band-strings. Buttons of all sorts, wire for cards. Wrought silks except Italian, crapes and tiffanies, velvets, silk-ribbons, girdles, laces, or stockings, or ribbons, &c. mixed with silk, gloves, and mits of leather or silk, and thrown silk except Italian. Woollen-cloths. Malt, by the annual malt-bill. Cambrics and French lawns are prohibited to be used in Britain, and may be imported for re-exportation into London only, upon license obtained from the commissioners of the customs, and security granted for re-exportation, in bales containing at least 100 pieces, covered with cloth, and must be lodged in ware-houses, under the joint keys of the proprietor and custom-house officers. Wrought silks, Bengals, and stuffs mixed with silk or herba of East Indian, Persian, or Chinese manufacture, and calicoes painted, printed, stained, or dyed there, may be entered under like restrictions, on payment of the half subsidy only.

The following articles, chiefly of hardware, cutlery, and leathern-ware, may not be imported for sale, and therefore can only be entered for re-exportation, or private use. Andirons, tennis-balls, counterfeit-basons, facing-bells, \* bits, bodkins, brushes, buskins, hanging-candlesticks, playing-cards, wool-cards, \* cauls, \* claps, caskets, chaffing-dishes, chess-men, combs, corsets, \* daggers, dagger-blades, dice, dripping-pans, ewers, forcers, furs tawed, \* girdles, goloches or corks, gridirons, hammers, \* harness or girdles for horses, hats, hilts, \* knives, ladles, any thing wrought of tawed leather, \* locks, pack-needles, painted wares, except paper and pictures, pattens, \* pins, pinsons, points, purses, rings of copper or latten gilt for curtains, \* saddles, \* scabbards, and sheaths, scissars, summers, sheers for taylors, shoes, \* stirrups, tin-ware, tires of gold or silver, fire-tongs, most kinds of iron-wire, wares made thereof, woollen-caps. The articles marked with an \* may, in no case, be imported for sale; the others only from Ireland, or taken upon the seas, or wrecked. A longer list of like articles may not be imported by strangers.

Ammunition, arms, gun-powder, and utensils of war, may not be imported without the king's licence.

The following goods may not be imported from Germany into the Netherlands: olive-oil, pitch, tar, potashes, rosin, salt, spicery, (except by license), tobacco and wines, (except Rhenish wines, or Hungarian wines from Hamburg), also deal-boards and fir-timber, except of the growth of Germany, imported

by British subjects, in ships built in and belonging to Britain.

Books, of which the copy-right is in private subjects, may not be imported under the penalty of 1 d. per sheet, besides forfeiture; and books first composed and printed in Britain, and reprinted abroad, may not be imported, unless they have not been printed at home for 20 years. Popish books may not be imported, under penalty of 40s. each book; and Popish crosses, and other superstitious things, under penalty of a premunire.

The importation of various other goods is restricted by particular regulations respecting the time and place of importation, the packages, the burden of the ship, and other circumstances.

Spirits, tea, coffee, and cocoa-berries when manufactured into chocolate, are subject to excise or inland duties. The places where these goods are kept and sold must be entered with and inspected by the officers of excise. They may not be removed without a permit; spirits, if above a gallon; tea, coffee, or chocolate, if above 6 lb. These permits are in force for a limited time only, and must be returned if not used. Dealers must keep accounts of their sales open to the inspection of the officers. The stock on hand is subject to their examination; and, if it does not correspond with the credit or quantity where-with they are chargeable, the dealers are liable in penalties.

Spirits may not be imported in casks under 60 gallons, except from the British colonies for private use; coffee, in quantities less than 112 lb.; and it may not be re-exported otherwise than in the original packages, or in quantities less than 4 C. except to Ireland, Cocoa paste and chocolate may not be imported. Chocolate must be manufactured in entered ware-houses, and put up in stamped papers, on payment of the inland duty. Cocoa-berries may not be sold in less quantities than 28 lb. at a time. Coffee from the plantations, accompanied with a certificate of the place of its growth, obtained on the oath of a planter, pays a smaller duty, and the parcels are marked with a particular stamp.

Rum, tea, coffee, and cocoa-berries, may be lodged in ware-houses under joint keys, on payment of the customs only; and delivered, when sold for home-consumption, on payment of the inland-duties, or for exportation, on bond being granted to send them abroad; and, if tea, to Ireland, or the colonies only. When rum is thus lodged, security must be given to pay the inland-duty when sold, or within 12 months if not sold. Accounts of the quantities of ware-housed goods are made up every 6 months, and the stock on hand examined.

Pepper may only be imported into London. It may be lodged in warehouses, under joint keys, upon payment of the half subsidy; the other duties to be paid when delivered for sale; and bond to be granted when delivered for exportation.

Spiceries, viz. cinnamon, cloves, mace, and nutmeg, may only be imported in British ships on license first obtained; the bale of cinnamon to weigh 70 lb. the cask of cloves, mace, or nutmeg, 300 lb. or upwards, unless from the East Indies.

Candles, soap, and starch, may not be imported, except

Custom-  
house  
Laws.

cept in packages of 224 lib. or upwards, openly stowed in the hold of the ship.

Hats and bonnets of bast straw, chip-cane, or horse-hair, in bales under 75 dozen, or materials for making such hats, in packages under 224 lib.

Oak-bark may not be imported when the price is under L. 10 per load, or L. 2. 10s. rindred bark.

Salt may not be imported otherwise than in bulk. Foreign salt, which is subject to a high excise, may be lodged in cellars, under joint keys, on payment of the customs only; and may be delivered from these cellars, upon bond, without payment of excise, if intended for curing fish of any kind, for exportation, or herrings for home consumption. These bonds are discharged, upon oath that the salt was applied to that purpose, and proof that suitable quantities of fish thus cured were exported, or of herrings entered for home-consumption, or that the salt perished at sea. Account is taken of the quantity on hand at the end of the fishing season; and, if there be any deficiency, the owners are liable in the penalty of 10s. per bushel. British salt may be taken in duty-free by ships bound on a fishing voyage to Ireland, or the north seas, under which the coasts of Scotland are comprehended, bonded and discharged as above.

Wheat under	48 s.	duty only 6 d.	on import.	under 44 s.	bounty 5 s.	on export.
Rye	32 s.		3 d.	28 s.		3 s.
Pease and beans	32 s.		3 d.			no bounty.
Oats	16 s.		2 d.	14 s.		24 s. 6 d.
Barley	24 s.		2 d.	22 s.		2 s. 6 d.

And, when wheat is imported at the low duties, wheat-flour may be imported on payment of 2 d. *per* Cwt. When the prices are higher than those which entitle to bounty, exportation is prohibited, except for ship-provisions, and 2500 quarters to Gibraltar, 3500 to Minorca, and 500 to St Helena, all from London; 5000 to Jersey, &c. from Southampton; 2500 to the Isle of Man, from Whitehaven and Liverpool; 200 quarters flour, 15 tons bread and beans, in any quantity, to Africa; 200 quarters wheat, and other corn, in any quantity, to Hudson's Bay; 2000 quarters wheat, and other corn, in any quantity, to the West Indies, from London; and corn of all kinds to Ireland, when there is an embargo on the exportation from that country. Corn from Ireland may always be re-transported to Ireland.

Corn imported, when subject to the high duties, may be lodged in ware-houses till re-exported, or till the prices rise to the limit of importation on the low duties.

The prices of corn are ascertained in England by the quarter-sessions; in Scotland by the sheriffs, once in three months, viz. 1st February, May, August, and November, on the testimony of witnesses; and the rate then fixed regulates the corn-trade for the ensuing three months: But the liberty to export, and bounty on exportation, by 14 Geo. III. is regulated by the prices at the nearest market-town, and last market-day.

When barley is imported on payment of 2 d. duty, Indian maize may be imported on payment of 1 d.

Tobacco may not be imported, except in casks containing at least 450 lb.; and the duties on tobacco from the British colonies may be secured for 18 months except the old subsidy, or it may be lodged in ware-

Custom-  
house  
Laws.

houses of the following kinds are prohibited to be imported in foreign ships, or bought of foreigners out of foreign ships. Herring, cod, pilchard, salmon, ling, grill, mackerel, whiting, haddocks, sprats, sole-fish, gull-fish, congers, flat-fish, and all fresh fish except eels, stock-fish, anchovies, sturgeon, botargo, caviar, lobsters, and turbot.

The herring-fishery is allowed free to all his majesty's subjects. For encouragement, see SALT and FISHERY.

Corn. The object of the laws respecting the corn-trade is to encourage agriculture, by not only permitting the free exportation, but rewarding it with a bounty when the prices are low, and checking the importation by a heavy duty; and, to prevent scarcity, by prohibiting the exportation when the prices are high, and permitting importation at an easy duty. Various temporary laws have been enacted for these purposes, and sometimes other expedients employed in times of scarcity, such as prohibiting the distillery from corn, and manufacture of starch. The prices which duties on importation, and bounties on exportation, were fixed by a standing law, in 1773, are as follows:

houses, on the importer's bond, for 15 months. No drawback is allowed on re-exportation, except from the port where it was imported, and in the original packages: nor when manufactured in packages less than 300 lb. except cut or rolled. Tobacco from the British colonies must be attended with a manifest from the custom-house there, containing the quantities and marks, which must be delivered to the custom-house on the ship's arrival. Damaged tobacco, for which the proprietor refuses to pay duty, may be cut off, and burned, (but not tobacco stems); and, if the damage be occasioned by stress of weather at sea, or accident after the ship's arrival, the proprietor is allowed  $\frac{1}{2}$  d. *per* lb. not exceeding 30s. *per* hd. If, after cutting off what is damaged, the remainder be under 450 lb. it may be re-packed at the sight of the officer. No tobacco, except of the British colonies, that has been manufactured here, and paid the duties, may be consumed on board ships of war. Tobacco, removed by water, or by land, above 24 lb. or snuff, above 10 lb. must be attended with a certificate, and the packages must be marked with the kind of goods in large letters. Importers must deliver to the chief officers of the customs an account of the quantities sold or delivered out to be manufactured, and must deliver annually an account of all the tobacco that has been 18 months in their possession. Tobacco seized is to be burned, and the officers allowed 2 d. *per* lb. Tobacco stems may not be imported, and, if exported, are entitled to no drawback. Tobacco may not be planted in Britain, except in physic-gardens, in small quantities.

Linen, chequered, striped, printed, painted, stained, or dyed, and fail-cloth, must be marked with a stamp on payment of the duty. Linen printed, or fail-cloth manu-

manufactured at home, is marked with a different stamp. These stamps are cut off on re-exportation. Every new ship must be provided with a complete set of sails manufactured in Great Britain. If sails be purchased abroad during a voyage, the ship-master must report them, and pay duty on his arrival.

Wine may not be imported in casks containing less than 25 gallons, except from Tuscany in open flasks, and from the Levant, in flasks or bottles; and no French, Spanish, or Portuguese wine may be imported in casks less than hogheads. Wine imported into London, and Levant wine into Bristol and Southampton, pay higher duties; and, when carried to these places, must pay the extra-duties, and be attended with a certificate. Damaged wine may be delivered to the custom-house officers, who are to mix it with salt or vinegar; and it must be sold to be distilled into brandy, or made into vinegar; the price, not exceeding L. 4 for French or German wine, or L. 8 for any other, is given to the proprietor, the overplus paid into the customs.

To guard more effectually against clandestine trade, the importation of some articles is only permitted in ships of a certain burden, whose operations are not easily concealed. Spirits must be imported in ships of 100 tons, or upwards, except rum, and spirits of British plantations, which are only restricted to 70 tons; tea, tobacco, and snuff, 50 tons; salt, 40 tons. Tobacco and rum may not be exported in ships under 70 tons.

*Duties.* All goods imported are liable to duties, except such as are expressly exempted. The revenue of customs † is of great antiquity in Britain, but was new modelled at the restoration of Charles II. A subsidy of tonnage on wines, and of poundage, or 1 s. per pound value of other goods, was granted during the king's life, and, after several prolongations, rendered perpetual. A book of rates was compiled for ascertaining these values; and articles not rated pay duty according to the value, as affirmed upon oath, by the importer, except East India goods, which pay according to the value as sold at candle. If the goods be valued too low by the importer, the custom-house officer may seize them, upon paying to the proprietor the value he swore to, and 10 per cent. for profit; such goods to be sold, and the overplus paid into the customs. Another book of rates was published, under sanction of parliament, 11th George I. containing articles omitted in the former ones; and various additional duties have been imposed; some on all goods, some on particular kinds; some according to the rates, some unconnected with the rates; some with an allowance of certain abatements, some without any allowance; the greater part to be paid down in ready money, and a few for which security may be granted; often with variations, according to the ship's place, and circumstances of importation. The number of branches now amounts to upwards of 50; and sometimes more than 10 are chargeable on the same articles. By this means, the revenue of the customs has become a subject of much intricacy, especially to the officers, who must distinguish the different branches which are appropriated by law to different purposes.

Goods must be landed in lawful ports, between the hours of 6 and 6 in summer, and in day-light in win-

ter, and in presence of an officer. Shipmasters must proceed directly to the place of unloading, and make report at the custom-house, upon oath, of the burden and lading of their ship. The proprietors may enter their goods within 20 days, by delivering to the collector five bills of entry, which contain a note of the kinds of goods, quantities, and packages, and paying the duties, or granting security, in cases where it is admitted. A warrant is then delivered to the land-waiter, to permit them to be landed; and they are examined, before removal, to try their correspondence, in quantity and quality, with the entry. If the merchant has entered too little, he is allowed to make a second or post-entry for the difference. If he has entered too much, he may obtain a return of the overplus, upon showing satisfactory reason for the over entry. If he be not acquainted with the quality of the goods, which is sometimes the case in consignments, he may obtain a warrant, called a *bill of sight*, for landing and inspecting them before entry, on depositing as much money as the duties will probably amount to. If the goods be damaged, the principal officers may appoint two skillful neutral persons, to ascertain the extent of the damage; and a proportional abatement is allowed in the duties. Goods not entered within 20 days may be carried to the custom-house, for security of the customs; and small parcels of fine goods sooner: such goods to be sold by auction, if not relieved in 6 months; and the overplus, after paying duty and charges, given to the proprietor. A ship may break bulk at any lawful port; and duty is only paid for the goods unloaded there; but, when it proceeds to another port, report must be made of the goods entered before. When all the goods are entered and unloaded, if the entries correspond with the shipmaster's report, he is entitled to certain allowances called *portage*, the ship is cleared, and the officers dismissed.

Goods taken out of a stranded ship are liable to the same duties, and entitled to the same draw-back, as goods regularly entered. Goods taken in, or put out at sea, within four leagues of the coast, except for a lawful reason declared at the first port of delivery, are forfeited, with penalties. Ships under 50 tons burden, hovering within two miles of the coast, may be compelled to give bond to proceed to foreign parts, or, if prohibited, forfeited. Goods taken and condemned as lawful prizes pay duty as other goods, and sometimes have been permitted, by temporary acts, to be ware-housed, or, though rated, to pay duty *ad valorem*. Prize military stores pay no duty. These bonds are relieved in the same manner as bonds for goods entitled to bounty or drawback.—Of which afterwards.

*Penalties.* The payment of duties, and observance of other laws, are enforced, by many penalties, against the owners of the goods, the shipmaster, the officers, and all accessories. Goods attempted to be landed clandestinely, or taken out at sea within four leagues of the coast; or found on board a ship after clearance, or not reported, and found on board concealed, though before clearance; and tea and spirits found on board hovering vessels, are forfeited. Sometimes the additional penalty of double or treble the value, sometimes

Custom-house  
Laws.

times a fixed sum, is incurred; porters, and others, assisting at running goods, are liable to fine and imprisonment; boats and carts employed are forfeited. Customable and prohibited goods, found in a boat, on the water, or bringing from the water-side, or found, by credible information, in any house, may be sent to the king's warehouse till claimed, and proof made that they have paid duty, or been bought in lawful trade; the *onus probandi* to lie on the claimer. Persons lurking near the sea to assist at running uncustomed goods, may be committed to the house of correction.

Shipmasters concurring in prohibited trade, or neglecting any of the forms prescribed by law, are liable to fines; and, in some cases, the ship is forfeited. Among the offences which subject to that penalty, are the following: Importing goods against the act of navigation, deals, or other prohibited goods, from Germany and the Netherlands; foreign fish; cattle, British and Irish salt, irregularly shipped, spirits in ships under 40 tons, spiceries, without delivering the license to the custom-house, or hops clandestinely; exporting coals clandestinely; exporting wool or tallow; permitting goods to be taken in or out at sea within four leagues of the coast; transgressing the privileges of the East-India or South-Sea Companies; neglecting the forms and regulations prescribed for trading to Ireland, and the colonies, of which afterwards; hovering ships, under 50 tons burthen. In some cases, the ships are appointed to be burned, unless they can be useful in his majesty's service. When the prohibition depends on the place of growth, the *onus probandi* lies on the defendant. Offences are cognizable by the court of exchequer, and often by the justices of peace, or commissioners of customs or appeals, by particular statutes.

Offences attended with violence are more severely punished. Persons employed in smuggling, wearing disguises, carrying arms, or resisting officers, are liable to transportation by several statutes; and by 9 Geo. II. any persons, three or more, carrying on illicit trade, or refusing seized goods or prisoners, or any persons so employed having their faces blacked or wearing a vizard mask or other disguise, and every person maiming, shooting, or dangerously wounding any officer in the execution of his duty, are to suffer death as felons. On the other hand, rewards are given to those who suffer in support of the revenue.

Counterfeiting stamps, or custom-house writings, is declared felony.

The duties payable by aliens are generally higher than by British, and they are excluded altogether from some branches of trade. See ALIEN.

*Good; duty-free.* The following goods may be imported duty-free:—Diamonds, pearls, and precious stones; flax, lintseed, linen rags, beaver-wool, wool for clothers, and linen yarn unbleached. The following drugs for dyers, if regularly entered: Agaric, annatto, antimonium crudum, aquafortis, arsenic, bay-berries, Brazil wood, Braziletto wood, cochineal, cream-of tartar, fustic, galls, gum-arabic, indigo, isinglass, litmus, logwood, madder, Nicorago wood, orchil, orchelia, or Spanish-weed, pomegranate pills, red-wood, saffore, sal ammoniac, sal gem, Japan wood, red Saunders, sumach, stick-lake, turnsole, vateria, verdigrease.

The following goods from America: Wood and tim-

ber, cotton, wool, rice, fago, vermicelli, short silk, pig and bar iron, &c.

The following from Ireland: cattle, horses, butter, cheese, beef, pork, mutton, hemp, raw calve-skins, thread, cotton, woollen or bay yarn, and woollen stuffs by licence.

Oil, whale-blubber, whale-fins, and skins, taken by ships employed in the British whale-fishery.

Bounties on importation. From America.		L. s. d.
Masts, yards, and boltsprits, per ton of 40 feet		1 — —
Tar, per ton of 8 barrels		2 4 —
— made from trees stripped a year before, according to certain directions, and certified		4 — —

heads per 3600, ditto		2 — —

Trees from Scotland, fit for masts, yards, and boltsprits, per ton	I 00 00
--	---------

Goods from the plantations, entitled to bounty, must be attended with a certificate concerning the place of their growth, and must be examined by the proper officers when loaded, whether they be good, merchantable, and otherwise suitable to the descriptions which entitle to bounty, and a certificate of their quality must be granted.

2. REGULATIONS CONCERNING EXPORTATION.] Goods of most kinds may be exported duty free, when regularly entered; and those that have paid duty on importation are generally entitled to draw-back of part, sometimes of the whole, when re-exported within three years, upon certificate that the duties were paid on importation, and oath of their identity. In some cases, a bounty is given on manufactured goods, when the materials from which they were manufactured have paid duty on importation; and manufactures subject to excise have generally the whole or part of the excise-duty returned. Some bounties are also granted, in favour of certain branches of trade, although they have not contributed, in any shape, to the revenue.

No goods, except fish, may be loaded for exportation, till the master has entered his ship outwards. The exporter must make out four bills of entry, and deliver them to the collectors, and pay down the duties, if any be due. Upon this he receives a cocket, certifying the entry and payment, and then may ship the goods in presence of the searcher, who certifies the quantity on the back of the cocket. When all the goods are shipped, the shipmaster goes to the custom-house, and makes report, upon oath, concerning the burthen, property, and crew, of his ship, and the goods

from  
house  
laws.

goods on board, which are inserted in the report, from the indorsements on the coqueets. He then receives his coqueets, and is cleared outward. If more goods be afterwards taken in, they may be added to the report. If the ship proceeds to any other port, to take in more goods, the must take out a new clearance at each port, and must specify the goods taken in at the former ones.

Goods liable to duty, shipped before entry, or goods prohibited to be exported, are forfeited. If it be proven that goods have been clandestinely exported, the proprietors forfeit double value.

Goods intitled to bounty or drawback, or prohibited to be consumed, may be examined before or after shipping, and, if found less in quantity, or different in quality, from what they were entered for, they are forfeited, with penalties. Bonds are taken, in case of bounties, and in some cases of drawbacks, that the goods shall not be re-landed in Great-Britain, the dangers of the seas excepted. These bonds are relieved by certificate from the magistrates of the place where they are unloaded, or of a British consul, or two creditable British merchants, or by proof that they were lost at sea. In case of exportation to Ireland, they are relieved by certificate from the custom-house, at the port of delivery there.

Debentures are made out at the custom-house for the drawbacks and bounties. These contain a declaration of the exporter concerning the quantities and kinds of goods, and circumstances that entitle them to bounty, taken on oath, before the principal officers; a certificate by the officers on duty, that the goods were shipped in conformity, and the ship legally navigated; an intimation that an oath or bond has been taken, not to re-land them; and a note of the amount of the bounty or drawback. The collector of the customs may pay the bounty himself, if he has money in his hands pertaining to the fund from which it is appointed to be paid. If otherwise, he certifies the same to the commissioners of the customs, who order payment in course. Goods sent to Ireland receive no drawback, till certificates be returned of their being landed there.

*Goods prohibited to be exported.* White ashes, horns, unwrought hides of black cattle, (except calfskins dressed with the hair,) tallow, clocks, watches, cases, and dial-plates, unless fit for use, with the maker's name; coin without the king's license, (except foreign coin, upon license); bullion, unless certificate be produced that it is not molten from British coin or plate. These metals: brass, copper, latten, bell-metal, pan-metal, gun-metal, and shuff-metal, (except lead and tin, or copper and mundaie, made of British ore, and foreign copper in bars. Gun-powder, when the price exceeds 5 l. per barrel. Engines for knitting stockings; tools and utensils for cotton, linen, woollen, and silk manufactures. Wool, sheep, wool-fells, mortlings, shortlings, woollen-yarn, wool-flocks; slight manufactures of wool that may be reduced to wool again; fuller's earth, fulling clay, and tobacco-pipe clay.

The woollen manufacture is considered as the most important, and is highly favoured by our laws. The exportation of the materials is therefore declared a common nuisance, and prohibited under very strict re-

gulations and severe penalties. Wool may not be carried by land, except in the day-time, having the word WOOL marked on each package; it may not be shipped coastwise, except on license previously obtained; and it must be entered at the custom house before it be brought within five miles of the sea-shore, and bond must be granted to re-land it in Britain, which can only be discharged by certificate from the port of delivery. The penalties for exporting wool are, forfeiture of ship and cargo, with treble value, and three years imprisonment. If wool exported be not discovered, the inhabitants of the place are liable for treble value. In Kent and Suffex, the shearers of wool, within 10 miles of the sea, must give notice to the officer of the number of fleeces, and part where lodged, within three days, and it cannot be removed without a permit. Purchasers of wool, within 15 miles of the sea, must give security to sell it in the inland country, or manufacture it themselves; and wool carried within 15 miles of the sea, without being entered, is forfeited, with high penalties. Armed vessels are appointed to cruise at proper stations, to search all ships suspected of exporting wool. Most of these regulations extend to wool, fells, &c. Exporting sheep is punished with the loss of the left-hand for the first offence, and with death for the second. The following articles are excepted from the prohibition: Lamb-skins ready dressed, limited quantities from Southampton to Jersey, &c.; wool-fells and widders for ships use; foreign wool may be re-exported, but in British ships only. White woollen cloths pay duty on exportation; but dyed cloths, and other woollen manufactures, are exported duty-free.

*Bounties on Goods exported.* Refined sugar L. s. d.  
manufactured in Great-Britain from  
brown sugar of the colonies, per C. — 9 —  
Corn. See p. 4142.

Sail-cloth, British-made, per yard — — — 2  
Linen, British, or Irish, 24 inches broad,  
or upwards, under 5 d. per yard — — — 1  
— from 5 d. to 6 d. — — — 1  
— from 6 d. to 1 s. — — — 2

Chequered linen, 25 inches broad, not  
exceeding 1 s. 6 d. nor under 7 d. — — — 1  
Diaper, not exceeding 1 s. 6 d. — — — 1½

But printed linen has no bounty.

Silk stuffs of British manufacture, and silk  
ribbons, per lb. — — — 3 —  
Ditto, mixed with gold and silver — — — 4 —  
Ditto, of silk and Gogran yarn — — — 8 —  
Ditto, mixed with cotton — — — 1 —  
Ditto, mixed with worsted — — — 6 —

But mixed stuffs must have at least ¾ of  
the warp silk, and the value must be  
double the bounty.

Silk stockings, gloves, fringes, laces, and  
sewing silk — — — 1 3  
Gold thread, lace, or fringe, per lb. — — — 6 —  
Silver ditto — — — 5 —  
Cordage, not of American hemp, exported  
to foreign places in Europe, per C. — 2 4½  
Gun-powder, per barrel, qt. 1 C. — 4 6

Spirits from barley, malt, or other corn,  
when barley is under 24 s. per qr. (be-  
sides drawback of excise) per ton — 10 —

Custom-  
house  
L. w.s.

The following bounties are also granted on ships employed at the fisheries:

*Herring-Fishery.* Decked vessels, from 20 to 80 tons, taking on board 12 bushels of salt for each last, and 6 men for every 20 tons, repairing to Yarmouth, Whitehaven, Leith, Inverness, Brailley-bound, Campbelltown, Oban, or Kirkwall, from 22 June to 24 October, granted 1771, for seven years, and to the end of the then next session of parliament; 30s. per ton.

*Newfoundland Cod-fishery.* Vessels of 50 tons, or upwards, manned with 15 men, catching 10,000 fish, landing at Newfoundland, and making another trip, and returning to the same port with another cargo; granted 1775, for 11 years;

First 25 vessels, each	L. 40 — —
Next 100 vessels, each	20 — —

*Whale-Fishery.* In Greenland seas, Davis's Straits, and parts adjacent, a bounty granted 1771, of 40s. per ton to 1776, 30s. to 1780, and 20s. to 1787, on ships of 200 tons, carrying 28 men, besides the master and surgeon, six months provisions, four boats, 20 harpoon-irons, and 40 lines of 120 fathoms; and, for every 50 tons more, one boat, six men, and 10 lines, and taking one apprentice for every 50 tons. These ships must continue at the fishing till 10th August, unless their loading be completed sooner, and must belong entirely to the place where fitted out. No bounty is allowed for more than 400 tons on one ship.

A bounty was granted in 1775, to continue 11 years, for encouraging the whale-fishery on the coast of Newfoundland and Labrador, the river St Lawrence, and bay of Chaleur. The five ships that take the greatest quantity of blubber, being equipped as for the Greenland fishery, are entitled to the following sums:

First greatest quantity	L. 500
Second	400
Third	300
Fourth	200
Fifth	100

A like bounty was granted in 1776, to continue for the same term of years, in favour of the whale-fishery on the American coast, south of latitude 44°. The ships employed in these fisheries to be British-built, manned by  $\frac{1}{2}$  British subjects, belonging to subjects residing in Britain or Ireland, and must take one apprentice for every 50 tons.

When naval stores are imported on bounty, or iron from America, duty-free, pre-emption must be offered to the commissioners of the navy.

which pay duty in Britain, till an equal duty be laid on by the Irish parliament: nor to bar-iron, and iron-ware, till subjected to duties; bar-iron L. 2, 10s. and slit-iron L. 3, 3s. per ton; nor to goods which have any bounty on exportation from Ireland.

Provisions, lines, and nets, for Newfoundland fishery, and cloathing and accoutrements for the forces in Irish pay in America, may be exported from Ireland.

On the other hand, wrought silks, mussels, and calicoes, of Persia, or the East Indies, and the enumerated goods and sugars of the British plantations, spirits and molasses of foreign plantations, and hops and glass, may only be imported from Britain. Hops receive no drawback on exportation there. Glass of British manufacture only is permitted to be imported, and it may not be re-exported.

Wool, and woollen manufactures, might not be exported from Ireland, except to Britain; and woollen manufactures might only be exported from certain ports in Ireland, to certain ports in the west coast of England, on licence previously obtained.

These restrictions, however, were considered by the Irish as very oppressive; and accordingly, after many complaints, an act was passed in their favour, which received the royal assent on the 23d of December 1779. This act repealed part of that of 10 and 11 Wil. III. ("to prevent the exportation of wool out of the kingdoms of Ireland and England into foreign parts, and for the encouragement of the woollen manufacture in the kingdom of England,") and so much of any other act or acts of parliament made in Great Britain, which prohibit, or in any manner restrain, the exportation of cloth, bays, kerseys, fays, friezes, druggets, cloth-ferges, shalloons, or any other drapery-stuffs or woollen manufactures whatsoever, made up or mixed with wool or wool-flocks, from the kingdom of Ireland into foreign parts; also so much of an act 29 Geo. II. ("for granting to his majesty several rates and duties, and for obviating some doubts about making out orders at the exchequer for the moneys advanced upon the credit of the salt-duties granted and continued to his majesty by an act of the last session of parliament") as relate to the exportation of glass, glass-bottles, or glass of any kind or denomination whatever, from or out of the kingdom of Ireland.

6. COLONIES.] The establishment of colonies may prove beneficial, in various respects, to the mother-country. They supply us with commodities which cannot be produced at home; they afford employment and subsistence to our supernumerary hands; they open new markets for our manufactures; and increase the number of our shipping and seamen. When their territories are extensive and fertile, they must increase in population and riches; and, if the connection can be preserved, will promote the strength of the nation, by contributing to its forces and revenue, for the common benefit. See COLONY.

When a colony is first established, agriculture is the natural employment of the settlers. Their lands are generally uncultivated, and thinly inhabited; and their industry is exerted to its best advantage in the production of commodities that yield a price in Europe, and are exchanged for manufactures already brought to perfection there. Such will be the state of things at first, though no restrictions be interposed. The Bri-

tish legislature has attempted to prolong this kind of intercourse beyond its natural period. Desirous to possess the whole advantages of their trade, and jealous of the favourite woollen manufacture, we have imposed many restrictions on their commerce, and some on their manufactures; but, in return, besides the benefit of protection, we have encouraged the staple articles of their produce, by various bounties and privileges.

The duties and commercial restrictions imposed on the colonies, have furnished an offensive cause for the revolt of America. As these laws are still observed in the colonies subject to Britain, and require to be stated, in order to direct our judgment how far the grievances complained of by the revolted colonies were well founded, we have drawn out the following abstract:

No goods may be imported into, or exported from the plantations in Asia, Africa, or America, except in ships built in Britain, Ireland, or the plantations, or prize-ships, manned by British subjects, duly registered, and legally navigated.

The following goods, enumerated in the act of navigation, and subsequent acts, may not be exported from the plantations, except to some other plantation, or to Europe: tobacco, cotton wool, indigo, ginger, sultic and other dyeing woods, molasses, hemp, copper ore, beaver-skins and other furs, pitch, tar, turpentine, masts, yards, and boltspits, coffee, pimento, cocoa nuts, whale-fins, raw-silk, pot and pearl ashes. Rice and sugars are enumerated in the list, but are now under different regulations.

Rice may be shipped in Carolina, Georgia, and Florida, directly for places south of Cape Finisterre, upon licence taken out in Britain, bond being granted that none of the other enumerated goods will be taken in, and that the ship will proceed directly with the rice, according to the licence, and return to Europe before it goes again to the plantations. The quantities of rice are indorsed on the licence, and the half-subsidy paid in Britain by the person who grants the bond, on a return of the quantity transmitted from America. The master, on his return, must produce a certificate from the British consul, or two creditable merchants, that the rice was delivered, and no other enumerated goods on board.

Sugar may be sent to foreign countries, without being landed in Britain, the major part of whose owners reside in Britain, and the rest in the colony, upon licence taken out in Britain, and bond granted that no enumerated goods shall be laden. If the sugar be destined for places north of Cape Finisterre, the ship must touch at Britain, and make entry of its cargo; but need not be unloaded, unless fraud be suspected. If its destination be south of Cape Finisterre, it may proceed directly; but the ship must return to Europe within 8 months after unloading, and before making another voyage to the plantations; and the master must produce a certificate of the landing of the sugar, and make entry of the quantity, but without payment of any duty.

Iron may not be imported to Europe, except to Ireland; and none of the non-enumerated may be imported to any country south of Cape Finisterre, except the bay of Biscay.

When a ship sails from Britain to the colonies, bond must be granted, to the extent of L. 1000 if under

100 tons burden, and L. 2000 if above it; that, in case it take in any of the enumerated commodities, it will proceed directly to Britain, or some other plantation; and, in case it takes in non-enumerated commodities, it will proceed to places where these goods may be lawfully exported, and return certificate of their delivery within 18 months. When ships arrive at the colonies from other places, a like bond must be granted to the governor.

No European goods may be imported into the colonies from Madeira and the Azores, belonging to the British, salt for the fisheries, and goods that are permitted from Ireland.

Vessels hovering on the coasts of the plantations, without coquets, and foreign vessels, are forfeited.

The following is a table of the British duties payable in the colonies:

	L.	s.	d.
Foreign white sugar imported, per Cwt.	1	2	—
Foreign sugar and pannelles, per Cwt.	—	5	—
Foreign indigo, per lb.	—	—	6
Foreign rum, or spirits, per gallon	—	—	9
Madeira wine, per ton	7	—	—
Spanish and Portugal wine, per ton	—	10	—
Molasses, British or foreign, per gall.	—	—	1
Coffee, from colony to colony, per Cwt	—	7	—
Pimento do. per lb.	—	—	$\frac{1}{2}$
Tobacco do. per lb.	—	—	$\frac{1}{2}$
Indigo do. per lb.	—	—	2
Logwood do. per Cwt.	5	—	—
Other dying wood, from colony to colony, per Cwt.	—	10	—
Ginger do. per Cwt.	—	1	—
Cocoa nuts do. per lb.	—	—	2

Foreign indigo, and cotton wool, may be imported to the West Indies duty free.

Duties on glass, tea, paper, and painter's colours, were imposed in 1767, and all repealed, except 3 d. per lb. on tea, which gave occasion for those disturbances that have produced the present unhappy separation.

The whole of the old subsidy is generally retained on goods exported to America. One half thereof is generally drawn back on goods exported to other places.

The colonies are prohibited to erect slit mills, to export wool or woollen manufactures, or transport them by sea from one colony to another, and to transport hats, by sea or land-carriage, from one colony to another.

In return for these duties and restrictions, the colonies are favoured with various mercantile privileges. Many of their commodities are admitted into Britain duty free; and almost all of them on easier duties than from foreign countries. Bounties are granted on their naval stores, indigo, and silk. Large sums have been granted for their establishment, and continue to be granted in favour of those whose circumstances require it. And the planting of tobacco is severely prohibited in Britain, that theirs may be without a rival.

The general policy of Britain, in confining the advantages granted to the colonies, to the encouragement of their produce only, has, in one instance, been

dispensed with. Dominica [late taken by the French], and Jamaica, being conveniently situated for trading to the French West Indies and the Spanish main, free ports have been opened for that purpose, and the restrictions of the act of navigation, in some measure, relaxed.

Cattle, and all goods of foreign plantations, might be imported into the free ports of Dominica, in foreign ships not having more than one deck, except tobacco, coffee, cocoa, and manufactures.

The following goods from the British plantations might not be imported into Dominica; copper-ore, cotton, wool, ginger, fustic, dyeing-wood, hemp, indigo, molasses, beaver skins, sugar, coffee, cocoa, hides, skins, pot and pearl ashes, raw silk, and whale-fins.

Negroes imported in British ships, and all other British or plantation goods, legally imported, may be exported in foreign one-decked vessels, except tar, turpentine, and tobacco; but cotton, wool, and other enumerated goods, must be imported to Britain, according to the act of navigation.

No vessels with West Indian produce, except live cattle, may proceed from Dominica to the other West Indian islands; and no European, nor East India goods, may be exported from thence to the British plantations; nor any American produce liable to duty, without certificate that it is the produce of that island. Dominica timber might be exported, subject to the regulations of the act of navigation.

Sugars might be imported from Dominica for re-exportation, and ware-housed, on payment of 3 d. per cwt. duty; and other goods, on payment of half old subsidy, not drawn back, to be re-exported in ships of 70 tons.

American goods from Dominica, except certified to be the produce of that island, paid French duties.

Foreign plantation goods may be imported into the free ports in Jamaica, except sugar, coffee, pimento, molasses, ginger, tobacco, and manufactures.

**Mercantile Laws.** The laws relating to commercial and maritime affairs approach nearer to uniformity through the different countries of Europe, than those on other subjects. Some of the fundamental regulations have been taken from the Roman law; others have been suggested by experience, during the progress of commerce; and the whole have been gradually reduced to a system, and adopted into the laws of trading nations, but with some local varieties and exceptions.

The British legislature has enacted many statutes respecting commerce; yet, the greater part of our mercantile law is to be collected from the decisions of our courts of justice, founded on the custom of merchants. A proof of such custom, where no direct statute interferes, determines the controversy, and becomes a precedent for regulating like cases afterwards. The existence of a custom not formerly recognized, is, in England, determined by a jury.

The most common mercantile contracts are those between buyer and seller; between factor and employer; between partners; between the owners, masters, mariners, and freighters of ships; between insurers and the owners of the subject insured; and between the parties

parties concerned in transacting bills of exchange. See FACTORAGE, SALE, PARTNERSHIP, INSURANCE, BILL, &c. and the next article.

**Maritime Laws.** The most ancient system of maritime laws is that of Rhodes, which was in force during the time of the Grecian empire, and afterwards incorporated into the Roman law. Although, in some parts, not applicable to the present state of trade, and, in others, now hardly intelligible, it contains the ground-work of the most equitable and beneficial rules observed in modern commerce. A like system was set forth by Richard I. of England, called the *Statutes of Oleron*; and another, by the town of Wisby, in the island of Gothland. From these systems, improved and enlarged in the course of time, our general maritime law is derived. The jurisdiction of matters purely maritime belongs, in England, to the court of admiralty, which proceeds on the civil law; but their proceedings are subject to the controul, and their decisions to the review, of the superior courts.

We shall here consider, the obligations which subsist between the masters or owners of ships, the freighters, the mariners, and the furnishers of provisions or repairs.

1. *Masters and Freighters.* A charter-party is a contract between the master and freighters, in which the ship and voyage is described, and the time and conditions of performing it are ascertained.

The freight is most frequently determined for the whole voyage, without respect to time. Sometimes it depends on the time.

In the former case, it is either fixed at a certain sum, for the whole cargo; or so much per ton, barrel-bulk, or other weight or measure; or so much per cent. on the value of the cargo. This last is common on goods sent to America; and the invoices are produced to ascertain the value.

The burden of the ship is generally mentioned in the contract, in this manner, *one hundred tons, or there-by*; and the number mentioned ought not to differ above 5 tons, at most, from the exact measure. If a certain sum be agreed on for the freight of the ship, it must all be paid, although the ship, when measured, should prove less, unless the burden be warranted. If the ship be freighted for transporting cattle, or slaves, at so much a head, and some of them die on the passage, freight is only due for such as are delivered alive; but, if for *lading* them, it is due for all that were put on board.

When a whole ship is freighted, if the master suffers any other goods besides those of the freighter to be put on board, he is liable for damages.

It is common to mention the number of days that the ship shall continue at each port to load or unload. The expression used is, *work weather days*; to signify, that Sundays, holidays, and days when the weather stops the work, are not reckoned. If the ship be detained longer, a daily allowance is often agreed on, in name of *demurrage*.

If a ship be freighted by the month, the time that the freight commences may be mentioned in the contract, otherwise it is computed from the time it begins to load.

If the voyage be completed in terms of the agree-

ment, without any misfortune, the master has a right to demand payment of the freight, before he delivers the goods. But if the safe delivery be prevented by any fault or accident, the parties are liable, according to the following rules:

If the merchant does not load the ship within the time agreed on, the master may engage with another, and recover damages.

If the merchant loads the ship, and recalls it after it has set sail, he must pay the whole freight; but, if he unloads it before it sets sail, he is liable for damages only.

If a merchant loads goods which it is not lawful to export, and the ship be prevented from proceeding on that account, he must pay the freight notwithstanding.

If the shipmaster be not ready to proceed on the voyage at the time agreed on, the merchant may load the whole, or part of the cargo, on board another ship, and recover damages; but chance, or notorious accident, by the marine law, releases the master from damages.

If an embargo be laid on the ship before it sails, the charter-party is dissolved, and the merchant pays the expence of loading and unloading; but, if the embargo be only for a short limited time, the voyage shall be performed when it expires, and neither party is liable for damages.

If the ship be disabled, by any accident, from completing the voyage, without any fault in the master, he may load the goods on board another ship, to the port of destination, with consent of the owner; and, if that consent be refused, he is entitled to freight on the goods landed at the port he is forced into, or he may repair his ship, if it can be done within a short time, (within 3 days at most, according to the laws of the Hanse towns), and proceed. If he do not carry the goods to the port of destination, he is entitled to freight, *pro rata*, in proportion to the part of the voyage performed; and the proportion is determined by comparing the number of days he sailed before the accident, with the number in which he might probably have completed the voyage. [Locke, *et alii*, against Lyde, Mich. term, C. B. 33. Geo. II.]

If the shipmaster sails to any other port than that agreed on, without necessity, he is liable for damages; if thro' necessity, he must sail to the port agreed on, at his own expences.

If a ship be taken by the enemy, and re-taken or ransomed, the charter-party continues in force.

If the master transfers the goods from his own ship to another, without necessity, and they perish, he is liable for the value; but if his own ship be in imminent danger, the goods may be put on board another ship, at the risk of the owner.

If a ship be freighted out and home, and a sum agreed on for the whole voyage, nothing is due till it return; and the whole is lost, if the ship be lost on the return.

If a certain sum be specified for the homeward voyage, it is due, although the factor abroad should have no goods to send home.

In the case of a ship freighted to Madeira, Carolina, and home, a particular freight fixed for the homeward:

ward voyage, and an option reserved for the factor at Carolina to decline it, unless the ship arrived before 1st of March; the shipmaster, foreseeing he could not arrive there within that time, and might be disappointed of a freight, did not go there at all. He was found liable in damages, as the obligation was absolute on his part, and conditional only on the other.

If the goods be damaged without fault of the ship or master, the owner is not obliged to receive them and pay freight, but he must either receive the whole, or abandon the whole; he cannot choose those that are in best order, and reject the others. If the goods be damaged through the insufficiency of the ship, the master is liable for the same; but, if it be owing to fires of weather, he is not accountable. It is customary for shipmasters, when they suspect damage, to take a *protest against wind and weather* at their arrival. But, as this is the declaration of a party, it does not bear credit, unless supported by collateral circumstances.

If part of the goods be thrown over-board, or taken by the enemy, the part delivered pays freight.

The shipmaster is accountable for all the goods received on board, by himself or mariners, unless they perish by the act of God, or of the king's enemies. Though they should be seized by an armed rabble, he is liable: on this principle, that, otherwise, he might defraud the public, by combining with thieves, and the security of commerce would be destroyed.

Shipmasters are not liable for leakage on liquors; nor accountable for the contents of packages, unless packed and delivered in their presence.

Upon a principle of equity, that the labourer is worthy of his hire, differences arising with regard to freight, when the case is doubtful, ought rather to be determined in favour of the shipmaster.

2. *Ship and Owners with Creditors.* When debts are contracted for provisions or repairs to a ship, or arise from a failure in any of the abovementioned obligations, the ship and tackle, and the owners, are liable for the debt, as well as the master. The ship and tackle may be condemned by the court of admiralty; and the owners may be sued at common law.

By the mercantile law, the owners are liable in all cases, without limitation; but, by statute, they are not liable for embezzlement beyond their value of ship, tackle, and freight.

A shipmaster may pledge his ship for necessary repairs during a voyage: and this hypothecation is implied by the maritime law, when such debts are contracted. This regulation is necessary, and is therefore adopted by all commercial nations; for, otherwise, the master might not find credit for necessary repairs, and the ship might be lost. If repairs be made at different places, the last are preferable.

The relief against the ship is competent to the court of admiralty in England, only when repairs are furnished during the course of a voyage; for the necessity of the case extends no further. If a ship be repaired at home, (e. g. upon the river Thames), the creditor is only entitled to relief at common law.

The creditor may sue either the masters or owners;

but, if he undertook the work on the special promise of the one, the other is not liable.

If the master buys provisions on credit, the owners are liable for the debt, tho' they have given him money to pay them.

If a ship be mortgaged, and afterwards lost at sea, the owners must pay the debt; for the mortgage is only an additional security, tho' there be no express words to that purpose in the covenant.

If a ship be taken by the enemy, and ransomed, the owners are liable to pay the ransom, tho' the ransomer die in the hands of the captors.

3. *Owners and Mariners.* If a ship be lost before it comes to a port of delivery, the seamen lose all their wages; and, if lost afterwards, they lose their wages from the last port of delivery. If they run away, they lose all. In a voyage to the Newfoundland fishery, and from thence with the cargo to Europe, the port of destination in Europe is reckoned the first port of delivery. In a voyage to the East Indies, and home, the ship being lost on the return, the seamen were found entitled to their wages for the voyage outward, and half the time of loading and unloading.

The master may retain the seamen's wages to reimburse himself for damage sustained by their default.

Shipmasters going to foreign places must make an agreement with the mariners, (except apprentices,) in writing; and they are liable in penalties if they desert or refuse to proceed. Their wages must be paid within a month after their arrival, or when dismissed.

4. *Owners of the ship with each other.* By the common law of England, a few of the owners have a right to stop a voyage which the major part propose. By the laws of the admiralty, they cannot stop the voyage, but may compel the owners to give their stipulation for the safe return of the ship, and sue thereon, if it be lost.

5. *Owners of ship and cargo with each other.* There is a mutual obligation which subsists between all the owners of a ship and cargo. In time of danger, it is often necessary to incur a certain loss of part for the greater security of the rest; to cut a cable; to lighten the ship, by throwing part of the goods over-board; to run it ashore; or the like: and, as it is unreasonable that the owners of the thing exposed for the common safety should bear the whole loss, it is defrayed by an equal contribution among the proprietors of the ship, cargo, and freight. This is the famous *Lex Rhodia de jactu*, and is now called a *general average*.

The custom of valuing goods which contribute to a general average, is not uniform in all places. They are generally valued at the price they yield at the port of destination, charges deducted; and goods thrown over-board are valued at the price they would have yielded there. Sailors wages, cloaths and money belonging to passengers, and goods belonging to the king, pay no general average; but proprietors of gold and silver, in case of goods being thrown over-board, contribute to the full extent of their interest.

The following particulars are charged as general average: Damage sustained in an engagement with the enemy; attendance on the wounded, and rewards given for service in time of danger, or gratuities to the widows or children of the slain; ransom; goods given

to the enemy in the nature of ransom; charges of bringing the ship to a place of safety when in danger from the enemy, or waiting for convoy; charges of quarantine; goods thrown over-board; masts or rigging cut; holes cut in the ship to clear it of water; pilotage, when a lake is sprung; damage, when voluntarily run a-ground, and expence of bringing it afloat; goods lost by being put in a lighter; the long-boat lost in lightening the ship in time of danger; hire of cables and anchors; charges of laying in ballast, victualling, and guarding the ship when detained; charges at law, in reclaiming the ship and cargo; interest and commission on all these disbursements.

Though goods put on board a lighter, and lost, are charged as a general average; yet, if the lighter be saved, and the ship with the rest of the goods be lost, the goods in the lighter belong to their respective proprietors, without being liable to any contribution.

If part of the goods be plundered by a pirate, the proprietor or shipmaster is not entitled to any contribution.

The essential circumstances that constitute a general average are these: The loss must be the effect of a voluntary action; and the object of that action the common safety of the whole. Quarantine, which is allowed, seems not to fall within this description.

6. *Owners and Re-captors.* When a ship is taken and carried *infra presidia hostium*, and remains there for 24 hours, it has been held, by the maritime law, that the property was completely vested in the enemy; and, if afterwards re-taken, the property did not return to the former owners, but remained with the re-captors. But it is otherwise determined by the British statute.

If it be re-taken by the king's ships, it shall be restored to the former owners, on paying one eighth part of the value for salvage. If re-taken by a private ship within 24 hours, it shall pay an eighth part; if within 48 hours, a fifth part; if within 96 hours, a third part; and if above 96 hours, a half.

Those who rescue a ship or goods from any hazard, are entitled to a reasonable allowance, in name of salvage; and may retain what they have saved till the salvage be paid.

Game-Laws. See the article GAME.

Sir William Blackstone, treating of the alterations in our laws, and mentioning franchises granted of chase and free warren, as well to preserve the breed of animals, as to indulge the subject; adds, "From a similar principle to which, though the forest-laws are now mitigated, and by degrees grown entirely obsolete; yet from this root has sprung a *bastard slip*, known by the name of the *game-law*, now arrived to and wanting in its highest vigour: both founded upon the same unreasonable notion of permanent property in wild creatures; and both productive of the same tyranny to the commons: but with this difference, that the forest-laws established only one mighty hunter throughout the land; the *game-laws* have raised a little Nimrod in every manor. And in one respect the ancient law was much less unreasonable than the modern;

for the king's grantee of a chase or free-warren, might kill game in every part of his franchise; but now, though a freeholder of less than L. 100 a-year is forbidden to kill partridge upon his own estate, yet nobody else (not even the lord of the manor, unless he hath a grant of free warren) can do it without committing a trespass and subjecting himself to an action."

Under the article GAME, the destroying such beasts and fowls as are ranked under that denomination, was observed (upon the old principles of the forest-law) to be a trespass and offence in all persons alike, who have not authority from the crown to kill game (which is royal property) by the grant of either a free warren, or at least a manor of their own. But the laws called the *game-laws* have also inflicted additional punishments (chiefly pecuniary) on persons guilty of this general offence, unless they be people of such rank or fortune as is therein particularly specified. All persons therefore, of what property or distinction soever, that kill game out of their own territories, or even upon their own estates, without the king's licence expressed by the grant of a franchise, are guilty of the first original offence of encroaching on the royal prerogative. And those indigent persons who do so, without having such rank or fortune as is generally called a *qualification*, are guilty, not only of the original offence, but of the aggravations also created by the statutes for preserving the game: which aggravations are so severely punished, and those punishments so implacably inflicted, that the offence against the king is seldom thought of, provided the miserable delinquent can make his peace with the lord of the manor. The only rational footing upon which this offence, thus aggravated, can be considered as a crime, is, that in low and indigent persons it promotes idleness, and takes them away from their proper employments and callings: which is an offence against the public police and œconomy of the commonwealth.

The statutes for preserving the game are many and various, and not a little obscure and intricate; it being remarked, that in one statute only, 5 Ann. c. 14. there is false grammar in no fewer than six places, besides other mistakes: the occasion of which, or what denomination of persons were probably the penners of these statutes, it is unnecessary here to inquire. It may be in general sufficient to observe, that the *qualifications* for killing game, as they are usually called, or more properly the exemptions from the penalties inflicted by the statute-law, are, 1. The having a freehold estate of 100l. *per annum*; there being fifty times the property required to enable a man to kill a partridge, as to vote for a knight of the shire: 2. A leasehold for 99 years of 150l. *per annum*: 3. Being the son and heir apparent of an esquire (a very loose and vague description) or person of superior degree: 4. Being the owner, or keeper, of a forest, park, chase, or warren. For unqualified persons transgressing these laws, by killing game, keeping engines for that purpose, or even having game in their custody, or for persons (however qualified) that kill game, or have it in possession, at unreasonable times of the year, or unreasonable hours of the day or night, on Sundays or on Christmas day, there are various penalties assigned, corporal and pecuniary, by different statutes (after-mentioned), on any of which, but only on one at

a time, the justices may convict in a summary way, or (in most of them) prosecutions may be carried on at the assizes. And, lastly, by statute 28 Geo. II. c. 12. no person, however qualified to kill, may make merchandize of this valuable privilege, by felling or exposing to sale any game, on pain of like forfeiture as if he had no qualification.

The statutes above referred to are as follow. No person shall take pheasants or partridges with engines in another man's ground, without licence, on pain of 10*l.* stat. 11 Hen. 7. c. 13. If any person shall take or kill any pheasants or partridges, with any net in the night-time, they shall forfeit 20*s.* for every pheasant, and 10*s.* for every partridge taken; and hunting with spaniels in standing corn, incurs a forfeiture of 40*s.* 23 Eliz. c. 10. Those who kill any pheasant, partridge, duck, heron, hare, or other game, are liable to a forfeiture of 20*s.* for every fowl and hare; and felling, or buying to sell again, any hare, pheasant, &c. the forfeiture is 10*s.* for each hare, &c. 1 Jac. 1. c. 17. Also pheasants or partridges are not to be taken between the first of July and the last of August, on pain of imprisonment for a month, unless the offenders pay 20*s.* for every pheasant, &c. killed: and constables, having a justice of peace's warrant, may search for game and nets, in the possession of persons not qualified by law to kill game or to keep such nets, 7 Jac. 1. c. 11. Constables, by a warrant of a justice of peace, are to search houses of suspected persons for game: and if any game be found upon them, and they do not give a good account how they came by the same, they shall forfeit for every hare, pheasant, or partridge, not under 5*s.* nor exceeding 20*s.* And inferior tradesmen hunting, &c. are subject to the penalties of the act, and may likewise be sued for trespass. If officers of the army or soldiers kill game without leave, they forfeit 5*l.* an officer, and 10*s.* a soldier; 4 & 5 W. and M. c. 23. Higglers, chapmen, carriers, inn-keepers, victuallers, &c. having in their custody hare, pheasant, partridge, heath-game, &c. (except sent by some person qualified to kill game) shall forfeit for every hare and fowl 5*l.* to be levied by distress and sale of their goods, being proved by one witness, before a justice; and for want of distress shall be committed to the house of correction for three months: one moiety of the forfeiture to the informer, and the other to the poor. And selling game, or offering the same to sale, incurs the like penalty; wherein hare and other game found in a shop, &c. is adjudged an exposing to sale: killing hares in the night is liable to the same penalties: and if any persons shall drive wild-fowls with nets, between the first day of July and the first of September, they shall forfeit 5*s.* for every fowl; 5 Ann. c. 14. 9 Ann. c. 25. If any unqualified person shall keep a gun, he shall forfeit 10*l.*; and persons being qualified may take guns from those that are not, and break them; 22 & 23 Car. II. c. 25. and 33 H. VIII. c. 6. One justice of peace, upon examination and proof of the offence, may commit the offender till he hath paid the forfeiture of 10*l.* And persons, not qualified by law, keeping dogs, nets, or other engines to kill game, being convicted thereof before a justice of peace, shall forfeit 5*l.* or be sent to the house of correction for three months; and the dogs, game, &c. shall be taken from them, by the

statute 5 Ann. If a person hunt upon the ground of another, such other person cannot justify killing of his dogs, as appears by 2 Roll. Abr. 567. But it was otherwise adjudged Mich. 33 Car. II. in C. B. 2 Cro. 44. and see 3. Lev. xxviii. In actions of debt, *qui tam*, &c. by a common informer on the statute 5 Ann. for 15*l.* wherein the plaintiff declared on two several counts, one for 10*l.* for killing two partridges, the other for 5*l.* for keeping an engine to destroy the game, not being qualified, &c. the plaintiff had a verdict for 5*l.* only: this action was brought by virtue of the stat. 8 Geo. I. See stat. 9 Geo. I. c. 22. See likewise 24 Geo. II. c. 34. for the better preservation of the game in Scotland. By the stat. 26 Geo. II. c. 2. all suits and actions brought by virtue of stat. 8 Geo. I. c. — for the recovery of any pecuniary penalty, or sum of money, for offences committed against any law for the better preservation of the game, shall be brought before the end of the second term after the offence committed.

By 28 Geo. II. c. 12. persons felling, or exposing to sale, any game, are liable to the penalties inflicted by 5 Ann. c. 14. on lugglers, &c. offering game to sale: and game found in the house or possession of a poulterer, falefman, fishmonger, cook, or pastry-cook, is deemed exposing thereof to sale.

By 2 Geo. III. c. 19. after the 1st June 1762, no person may take, kill, buy or sell, or have in his custody, any partridge, between 12th February and 1st September, or pheasant between 1st February and 1st October, or heath-fowl between 1st January and 20th August, or grouse between 1st December and 25th July, in any year; pheasants taken in their proper season, and kept in mews, or breeding places, excepted: and persons offending in any of the cases aforesaid, forfeit 5*l.* per bird, to the prosecutor, to be recovered, with full costs, in any of the courts at Westminster. By this act, likewise, the whole of the pecuniary penalties under the 8 Geo. I. c. 19. may be sued for, and recovered to the sole use of the prosecutor, with double costs; and no part thereof to go to the poor of the parish.

By 5 George III. c. 14. persons convicted of entering warrens in the night-time, and taking or killing coney there, or aiding or assisting therein, may be punished by transportation, or by whipping, fine, or imprisonment. Persons convicted on this act, not liable to be convicted under any former act. This act does not extend to the destroying coney in the day-time, on the sea and river-banks in the county of Lincoln, &c. No satisfaction to be made for damages occasioned by entry, unless they exceed 1*s.* It may not be improper to mention an act lately made and not yet repealed, viz. 10 Geo. III. c. 19. for preservation of the game, which shews the importance of the object. It is thereby enacted, That if any person kill any hare, &c. between sun-setting and sun-rising, or use any gun, &c. for destroying game, shall for the first offence be imprisoned for any time not exceeding six nor less than three months: if guilty of a second offence, after conviction of a first, to be imprisoned for any time not exceeding twelve months nor less than six; and shall also, within three days after the time of his commitment either for the first or for any other offence, be once publicly whipped.

Military

*Military Law.* See MILITARY and MARINE.

29. N. Lat. 38. 32.

Lawbur-  
rows  
||  
Lawsonia.

LAWBUBROWS, in Scots law. See LAW, Part III. N<sup>o</sup> clxxxiii. 16.

LAWENBURG, Dutchy, a territory of Germany, in the circle of Lower Saxony, bounded by the duchy of Holstein on the north and west, by the duchy of Mecklenburg on the east, and by the duchy of Lunenburg, from which it is separated by the river Elbe, on the West; being about 85 miles long, and 20 broad. The chief towns are Lawenburg, Mollen, Wittenburg, and Ratzeburg. It belongs to the elector of Hanover.

LAWENBURG, a city of Germany in the circle of Lower Saxony, and capital of a duchy of the same name. It is a small but populous town, situated on the Elbe, under the brow of a very high hill, from whence there is a delightful prospect over the adjacent country. It has a castle on an eminence, and is convenient for trade. E. Long. 10. 51. N. Lat. 53. 36.

LAWENBURG, a town of Germany in Farther Pomerania, and the chief place of a territory of the same name, belonging to the elector of Brandenburg.

LAWES (Henry), a celebrated musician, and the Purcell of his time. He was a servant to Charles I. in his public and private music, and set some of the works of almost every poet of eminence in that reign. The comus of Milton, and several of the lyrics of Waller, were set by him; and both these poets have done him honour in their verses. He composed a considerable number of psalm-tunes in the *Cantica Sacra*, for three voices and an organ; and many more of his compositions are to be seen in a work called *Select airs and dialogues*; also in the *Treasury of music*, and the *Musical companion*. He died in 1662.

LAWES (William), was brother to the former, and a most capital musician. He made above 30 several sorts of music for voices and instruments; nor was there any instrument then in use, but he composed to it as aptly as if he had studied that alone. In the music school at Oxford are two large manuscript volumes of his works in score for various instruments. He was a commissary under general Gerard in the civil war, and, to the great regret of the king, was killed at the siege of Chester in 1645.

LAWLESS COURT, a court said to be held annually on King's Hill at Rochford in Essex, on the Wednesday morning after Michaelmas-day at cock-crowing, where they whisper, and have no candle, nor any pen and ink, but only a coal. Persons who owe suit, or service, and do not appear, forfeit double their rent every hour they are missing.

This servile attendance, Camden informs us, was imposed on the tenants for conspiring at the like unreasonable hour to raise a commotion. The court belongs to the honour of Raleigh, and to the earl of Warwick; and is called *lawless*, from its being held at an unlawful hour.

LAWINGEN, a town of Germany, in the circle of Suabia; formerly imperial, but now subject to the duke of Neuburg. Here the duke of Bavaria, in 1704, fortified his camp to defend his country against the British forces and their allies commanded by the duke of Marlborough, who forced their intrenchments. It is seated on the Danube, in E. Long. 10.

LAWN, a spacious plain in a park, or adjoining to a noble seat. As to the dimensions of a lawn: In a large park, it should be as extensive as the ground will permit; and, if possible, it should never be less than 50 acres: but in gardens of a moderate extent, a lawn of 10 acres is sufficient; and in those of the largest size, 15 acres. The best situation for a lawn, is in the front of the house: and here, if the house front the east, it will be extremely convenient; but the most desirable aspect for a lawn, is that of the south-east. As to the figure of the lawn, some recommend an exact square, others an oblong square, some an oval, and others a circular figure: but neither of these are to be regarded. It ought to be so contrived, as to suit the ground; and as there should be trees planted for shade on the boundaries of the lawn, so the sides may be broken by irregular plantations of trees, which, if there are not some good prospects beyond the lawn, should bound it on every side, and be brought round pretty near to each end of the house. If in these plantations round the lawn, the trees are placed irregularly, some breaking much forwarder on the lawn than others, and not crowded too close together, they will make a better appearance than any regular plantations can possibly do; and if there are variety of trees, properly disposed, they will have a good effect; but only those which make a fine appearance, and grow large, straight, and handsome, should be admitted here. The most proper trees for this purpose, are the elm, oak, chestnut, and beech; and if there are some clumps of ever-green trees intermixed with the others, they will add to the beauty of the whole, especially in the winter-season; the best sorts for this purpose, are lord Weymouth's pine, and the silver and spruce firs.

Laws, in manufactures, a fine sort of linen, remarkable for being used in the sleeves of bishops.

LAWRENCE (St), the largest river in north America, proceeding from the lake Ontario, from which it runs a course of 700 miles to the Atlantic ocean. It is navigable as far as Quebec, which is above 400 miles; but beyond Montreal it is so full of shoals and rocks, that it will not admit large vessels without danger, unless the channel be very well known.

LAWSONIA, EGYPTIAN PRIVET; a genus of the monogynia order, belonging to the octandria class of plants. There are two species, the *inermis* and *spinosa*, both natives of India. Some authors take the first to be the plant termed by the Arabians *henna*, or *alhenna*; the pulverised leaves of which are much used by the eastern nations for dyeing their nails yellow: but others, Dr Hasselquist in particular, attribute that effect to the leaves of the other species of Egyptian privet which bears prickly branches. It is probable, that neither set of writers are mistaken, and that the shrub in question is a variety only of the thorny lawsonia, rendered mild by culture.

Alhenna grows naturally and is cultivated throughout India, as also in Egypt, Palestine, and Persia. In those countries, says Hasselquist, it flowers from May to August. The leaves being pulverised, are made with water into a paste, which the inhabitants of those countries bind on the nails of their hands and feet, keeping it on all night. The deep yellow colour that

Lawyer  
II  
Lazuli.

is thus obtained is considerably permanent, not requiring to be renewed for several weeks. It would seem, that this custom is very ancient in Egypt; the nails of some mummies being found dyed in this manner. The dried flowers of henna afford a fragrant smell, which, it is affirmed, women with child cannot bear.

**LAWYER**, signifies a confessor, or one that is learned or skilled in the law. See **COUNSELLOR**, **BAR-RISTER**, and **SERJEANT**.

**LAY**, in French poetry, denotes a short poem, something like our ballads.

**LAY-BROTHERS**, among the Romanists, those pious but illiterate persons, who devote themselves in some convent to the service of the religious. They wear a different habit from that of the religious; but never enter into the choir, nor are present at the chapters; nor do they make any other vow except of constancy and obedience. In the nunneries there are also lay-sisters.

**LAY-MAN**, one who follows a secular employment, and has not entered into holy orders.

**LAYERS**, in gardening, are tender shoots or twigs of trees, laid or buried in the ground, till, having struck root, they are separated from the parent-tree, and become distinct plants.—The propagating trees by *layers* is done in the following manner: The branches of the trees are to be slit a little way, and laid under the mould for about half a foot; the ground should be first made very light, and after they are laid they should be gently watered. If they will not remain easily in the position they are put in, they must be pegged down with wooden hooks: the best season for doing this is, for ever-greens, toward the end of August, and, for other trees, in the beginning of February. If they are found to have taken root, they are to be cut off from the main plant the succeeding winter, and planted out. If the branch is too high from the ground, a tub of earth is to be raised to a proper height for it. Some pare off the rhind, and others twist the branch before they lay it, but this is not necessary. The end of the layer should be about a foot out of the ground; and the branch may be either tied tight round with a wire, or cut upwards from a joint, or cut round for an inch or two at the place, and it is a good method to pierce several holes thro' it with an awl above the part tied with the wire.

**LAYING THE LAND**, in navigation, the state of motion which increases the distance from the coast, so as to make it appear lower and smaller, a circumstance which evidently arises from the intervening convexity of the surface of the sea. It is used in contradistinction to *raising* the land, which is produced by the opposite motion of approach towards it. See **LAND**.

**LAZAR-HOUSE**, or **LAZARETTO**, a public building, in the nature of an hospital, to receive the poor, and those afflicted with contagious distempers. In some places, lazarettos are appointed for the performance of quarantine; in which case, those are obliged to be confined in them who are suspected to have come from places infected with the plague.

**LAZULI**, or *Lapis LAZULI*, is a blue stone, generally intermixed with white veins and gold-coloured spots. Wallerius considers this stone as a species of jasper; and Cronstedt, more justly, as a species of that

order of earths which have been lately called *zeolites*. Mr Margraaf, and also Mr Cronstedt, have made experiments on this stone, carefully cleaned from all white, pyritous, or heterogeneous matters. From these experiments we learn, 1. That this stone is soluble in acids without effervescence; and when it has been previously calcined, it forms gelatinous masses with acids. 2. That by calcination it is not deprived of its blue colour, till at least that operation has been long continued. 3. By a violent fire it is fusible, and forms a frothy glass, sometimes whitish, and sometimes of a dusky yellow-colour, but always clouded with blue spots. 4. Fused with nitre, and thrown red-hot into water, it tinged the water with a blue colour, which disappeared in some hours. By this operation the stone lost its blue colour. 5. Some of this stone, powdered and mixed with glass frit, produced a transparent citron-coloured glass. With borax, it produced a glass of a chrysolite-colour. 6. It gave no signs of its containing copper, notwithstanding it has been considered as an ore of copper by most authors. 7. It showed marks of iron, by forming a blue precipitate, like Prussian blue, when a phlogisticated alkali was added to a solution of this stone in acids. 8. Margraaf says, that by adding vitriolic acid to solutions of this stone in nitrous and marine acids, a white precipitate was formed, which he supposes was calcareous earth. Nevertheless, Mr Cronstedt affirms, that this stone does not effervesce with acids. Perhaps the calcareous earth was not essential, but only accidental. 9. Cronstedt says, that a precipitate is formed by adding a fixed alkali to a solution of this stone in vitriolic acid, which, being scorified with borax, yields a regulus of silver. He says, that by scorification with lead, two ounces of silver have been obtained from a hundred pounds of the stone. Mr Margraaf does not mention that he found any silver, or that he searched for any. Perhaps it is only accidental. The fine blue substance called *ultramarine* is prepared from lapis lazuli in the following manner, according to Wallerius. The stone, first finely levigated and mixed with linseed oil, is to be added to a paste, made by mixing together equal parts of yellow wax, colophony, and pitch, that is, half a pound of each, with half an ounce of linseed oil, two ounces of turpentine, and two ounces of mastic. To three or four parts of this paste one part of the levigated stone, mixed with linseed-oil, is to be added; and after the mixture has been digested together during three or four weeks, it is to be thrown into hot-water, and stirred till the blue colour separates and diffuses in the water, which is then to be poured off. The blue matter is allowed to settle; and, when dry, is the ultramarine required.

The lapis lazuli is found in many parts of the world; but that of Asia and Africa is much superior both in beauty and real value to the Bohemian and German kind, which is too often sold in its place.

**LEAD**. See **CHEMISTRY**, n° 151, 204, 248, 280, 397. and **METALLURGY**.

**Black LEAD**, a mineral dug in Britain, and, as Dr Woodward observes in the preface to his Method of Fossils, more plentiful and of a better kind there than in any other part of the world. According to Dr Plott's account in the Philosophical Transactions, n° 240, it

Lazuli.  
Lead.

Lead. is found only in Kewych in Cumberland; and is there called *wadit* or *kellow*, by which last name an earth like the black chalk is distinguished in other places.

The colour of black-lead, rather a deep, shining, bluish-grey, than a black, may be seen, diluted a little, in the black melting-pots when broken or the surface scraped off, and entire in the genuine sort of black pencils. It differs not a little in goodness, some sorts marking paper freely, and others very difficultly or scarce at all. It is smooth, and as it were unctuous to the touch; and hence is used sometimes instead of oil or soap for giving slipperiness to the rubbing parts of machines. Acids neither dissolve it nor alter its colour or unctuousity.

Black-lead has not been found to contain any of the metal from which it receives its name, and its composition appears to be of a very singular kind. From its known resistance to vehement degrees of fire, whether urged by itself in close vessels, or made with clay into melting pots, and placed among the burning fuel, it should seem that it could not partake largely of any volatile substance, and it has been generally supposed to consist chiefly of a tallowy earth. But Mr Quist relates, in a curious paper of experiments on black-lead published in the Swedish transactions for 1754, that having exposed many different specimens of this mineral to a strong heat, on a scorifying dish under a muffle, they all yielded sulphureous fumes and flowers in abundance; and that there remained behind, from one sort, only a fifth part of its weight, and from another no more than a 20th part, of a yellow or brown calx, which, being treated with inflammable fluxes, yielded seven tenths of its weight of a metallic mass, which seemed to be a mixture of iron and tin. Agreeably to these experiments, in Cronstedt's Mineralogy black-lead is classed among the sulphureous minerals, and called *sulphur satiated with iron and tin*.

Dr Lewis kept 168 grains of the finest black lead used by our pencil-makers in a moderately strong red heat on a scorifying dish for three hours, with the common precaution of covering the vessel for a time, lest the matter should crackle, and some particles be thrown off from it in substance. He found it reduced to about 120 grains, and all the pieces changed on the outside to a rusty sparkling brown calx; of which a considerable part was attracted by a magnetic bar, the internal parts continuing of the same colour as at first. Being then broken into smaller pieces, and exposed to a like heat for two hours, it suffered the same change as before, and was reduced to about 60 grains. Being further broken, and calcined with a moderate red heat for 10 hours, it was diminished to 30 grains; and, by a repetition of the operation, to 12 grains, or  $\frac{1}{14}$  of its original weight.

The remarkable diffipation in these experiments, of a substance which in close vessels resists intense fires, may be somewhat illustrated by the known property of charcoal, which when excluded from the action of the air, whether by being inclosed in a vessel, or mixed with clay into a mass, remains unconsumed and unaltered in the fire. Masses of black-lead seem to calcine and suffer a diffipation only on the surface; the internal part remaining long unchanged, unless

the mass be broken, or the calx rubbed off; so that fresh surfaces may be exposed to the air. The common black-lead melting-pots made of clay, and the coarser kinds of black-lead powdered, like those made of clay and charcoal powder, lose their external blackness with part of their weight, and thus have their staining quality destroyed by strong fire.

*Black-Lead Pencils.* Black-lead, in fine powder, stirred into melted sulphur, unites with it so uniformly and in such quantity, that though the compound remains fluid enough to be poured into moulds, it looks nearly like the coarser sorts of black-lead themselves. Probably the way which prince Rupert is said to have had, mentioned in the third volume of Dr Birch's history of the Royal Society, of making black-lead run like a metal in a mould, so as to serve for black-lead again, consisted in mixing it with sulphur or sulphureous bodies.

On this principle the German black-lead pencils are said to be made; and many of those which are hawked about by certain persons among us, are prepared in the same manner: their melting or softening, when held in a candle, or applied to a red-hot iron, and yielding a bluish flame with a strong smell of burning brimstone, betrays their composition; for black-lead itself yields no smell or fume, and suffers no apparent alteration in that heat. Pencils made with such additions are of a very bad kind: they are hard, brittle, and do not cast or make a mark freely either on paper or wood, rather cutting or scratching them, than leaving a coloured stroke.

The true English pencils, (which Vogel in his Mineral System, and some other foreign writers, imagine to be prepared also by melting the black-lead with some additional substances, and casting it into a mould) are formed of black-lead alone, sawed into slips, which are fitted into a groove made in a piece of wood, and another slip of wood glued over them: the softest wood, as cedar, is made choice of, that the pencil may be the easier cut; and a part at one end, too short to be conveniently used after the rest has been worn and cut away, is left unfilled with the black-lead, that there may be no waste of so valuable a commodity. These pencils are greatly preferable to the others, though seldom so perfect as could be wished, being accompanied with some degree of the same inconveniences, and being very unequal in their quality, on account of different sorts of the mineral being fraudulently joined together in one pencil, the forepart being commonly pretty good, and the rest of an inferior kind. Some, to avoid these imperfections, take the finer pieces of black-lead itself, which they saw into slips, and fix for use in port-crayons. This is doubtless the surest way of obtaining black-lead crayons whose goodness can be depended upon.

*Milled Lead.* See CHEMISTRY, n° 400.

*Poison of Lead.* See POISON.

LEAF, a part of a plant extended into length and breadth in such a manner as to have one side distinguishable from the other. This is Miller's definition. Linnæus denominates leaves "the organs of motion, or muscles of the plant."—The leaves are not merely ornamental to plants; they serve very useful purposes, and make part of the organs of vegetation.

Lead.  
Leaf.

The greater number of plants, particularly trees, are furnished with leaves: in mushrooms, and shrubby horse-tail, they are totally wanting. Ludwig defines leaves to be fibrous and cellular processes of the plant, which are of various figures, but generally extended into a plain membranaceous or skinny substance. They are of a deeper green than the foot-stalks on which they stand, and are formed by the expansion of the vessels of the stalk, among which, in several leaves, the proper vessels are distinguished by the particular taste, colour, and smell, of the liquors contained within them.

By the expansion of the vessels of the stalk, are produced several ramifications or branches, which, crossing each other mutually, form a kind of net; the meshes or interstices of which are filled up with a tender cellular substance, called the *pulp*, *pith*, or *parenchyma*. This pulpy substance is frequently consumed by certain small insects, whilst the membranous net remaining untouched, exhibits the genuine skeleton of the leaf.

The net in question is covered externally with an epidermis or scarf-skin, which appears to be a continuation of the scarf-skin of the stalk, and perhaps of that of the stem. M. DeCassure, a judicious naturalist, has attempted to prove, that this scarf-skin, like that of the petals, is a true bark, composed itself of an epidermis and cortical net; these parts seem to be the organs of perspiration, which serve to dissipate the superfluous juices.

The cortical net is furnished, principally on the surface of the leaf, with a great number of suckers or absorbent vessels, destined to imbibe the humidity of the air. The upper surface, turned towards heaven, serves as a defence to the lower, which looks downward; and this disposition is so essential to the vegetable economy, that, if a branch is overturned in such a manner as to destroy the natural direction of the leaves, they will, of themselves, in a very short time, resume their former position; and that as often as the branch is thus overturned.

Leaves, then, are useful and necessary organs; trees perish when totally divested of them. In general, plants strip of any of their leaves, cannot shoot vigorously: witness those which have undergone the depredations of insects; witness, likewise, the very common practice of stripping off some of the leaves from plants, when we would suspend their growth, or diminish the number of their shoots. This method is sometimes observed with corn and the esculent grasses; and, in cold years, is practised on fruit-trees and vines, to render the fruit riper and better coloured: but in this case it is proper to wait till the fruits have acquired their full bulk, as the leaves contribute greatly to their growth, but hinder, when too numerous, that exquisite rectifying of the juices, which is so necessary to render them delicious and palatable.

When vegetation ceases, the organs of perspiration and inspiration become superfluous. Plants, therefore, are not always adorned with leaves: they produce new ones every year; and every year the greater part are totally divested of them, and remain naked during the winter. See PLANT.

LEAF, in clocks and watches, an appellation given to the notches of their pinions.

Gold-LEAF, usually signifies fine gold beaten into Gold-LEAF plates of an exceeding thinness, which are well known in the arts of gilding, &c. The preparation of gold-leaf, according to Dr Lewis, is as follows.

"The gold is melted in a black-lead crucible, with some borax, in a wind-furnace, called by the workmen a *wind-hole*: as soon as it appears in perfect fusion, it is poured out into an iron ingot mould, six or eight inches long, and three quarters of an inch wide, previously greased, and heated, so as to make the tallow run and smoke, but not to take flame. The bar of gold is made red-hot, to burn off the unctuous matter, and forged on an anvil into a long plate, which is further extended, by being passed repeatedly between polished steel rollers, till it becomes a ribbon as thin as paper. Formerly the whole of this extension was procured by means of the hammer, and some of the French workmen are still said to follow the same practice: but the use of the flattening-mill both abridges the operation, and renders the plate of more uniform thickness. The ribbon is divided by compasses, and cut with sheers into equal pieces, which consequently are of equal weights: these are forged on an anvil till they are an inch square; and afterwards well nealed, to correct the rigidity which the metal has contracted in the hammering and flattening. Two ounces of gold, or 960 grains, the quantity which the workmen usually melt at a time, make 50 of these squares, whence each of them weighs six grains and two-fifths; and as 902 grains of gold make a cubic inch, the thickness of the square plates is about the 766th part of an inch.

"In order to the further extension of these pieces into fine leaves, it is necessary to interpose some smooth body between them and the hammer, for softening its blow, and defending them from the rudeness of its immediate action: as also to place between every two of the pieces some proper intermedium, which, while it prevents their uniting together, or injuring one another, may suffer them freely to extend. Both these ends are answered by certain animal membranes.

"The gold-beaters use three kinds of membranes; for the outside cover, common parchment made of sheep-skin; for interlaying with the gold, first the smoothest and closest vellum, made of calf-skin; and afterwards the much finer skins of ox-gut, strip off from the large straight gut slit open, curiously prepared on purpose for this use, and hence called *gold-beaters skin*. The preparation of these last is a distinct business, practised by only two or three persons in the kingdom, some of the particulars of which I have not satisfactorily learned. The general process is said to consist, in applying one upon another, by the smooth sides, in a moist state, in which they readily cohere and unite inseparably; stretching them on a frame, and carefully scraping off the fat and rough matter, so as to leave only the fine exterior membrane of the gut; beating them between double leaves of paper, to force out what unctuousity may remain in them; moistening them once or twice with an infusion of warm spices; and lastly, drying and pressing them. It is said, that some calcined gypsum, or plaster-of-Paris, is rubbed with a hare's foot both on the vellum and the ox-gut skins, which fills up such minute holes as may happen

in them, and prevents the gold-leaf from flicking, as it would do to the simple animal-membrane. It is observable, that, notwithstanding the vast extent to which the gold is beaten between these skins, and the great tenacity of the skins themselves, yet they sustain continual repetitions of the process for several months, without extending or growing thinner. Our workmen find, that, after 70 or 80 repetitions, the skins, though they contract no flaw, will no longer permit the gold to extend between them; but that they may be again rendered fit for use by impregnating them with the virtue which they have lost, and that even holes in them may be repaired by the dextrous application of fresh pieces of skin: a microscopical examination of some skins that had been long used plainly shewed these repairs. The method of restoring their virtue is said in the *Encyclopédie* to be, by interlaying them with leaves of paper moistened with vinegar white-wine, beating them for a whole day, and afterwards rubbing them over as at first with plaster-of-Paris. The gold is said to extend between them more easily, after they have been used a little, than when they are new.

"The beating of the gold is performed on a smooth block of black marble, weighing from 200 to 600 pounds, the heavier the better; about nine inches square on the upper surface, and sometimes less, fitted into the middle of a wooden frame, about two feet square, so as that the surface of the marble and the frame form one continuous plane. Three of the sides are furnished with a high ledge; and the front, which is open, has a leather flap fastened to it, which the gold-beater takes before him as an apron, for preserving the fragments of gold that fall off. Three hammers are employed, all of them with two round and somewhat convex faces, though commonly the workman uses only one of the faces: the first, called the *catch-hammer*, is about four inches in diameter, and weighs 15 or 16 pounds, and sometimes 20, though few workmen can manage those of this last size: the second, called the *shoddering-hammer*, weighs about 12 pounds, and is about the same diameter: the third, called the *goldhammer*, or *finishing hammer*, weighs 10 or 11 pounds, and is nearly of the same width. The French use four hammers, differing both in size and shape from those of our workmen: they have only one face, being in figure truncated cones. The first has very little convexity, is near five inches in diameter, and weighs 14 or 15 pounds: the second is more convex than the first, about an inch narrower, and scarcely half its weight: the third, still more convex, is only about two inches wide, and four or five pounds in weight: the fourth or finishing hammer is near as heavy as the first, but narrower by an inch, and the most convex of all. As these hammers differ so remarkably from ours, I thought proper to insert them, leaving the workmen to judge what advantage one set may have above the other.

"A hundred and fifty of the pieces of gold are interlaid with leaves of vellum, three or four inches square, one vellum leaf being placed between every two of the pieces, and about 20 more of the vellum leaves on the outides; over these is drawn a parchment case, open at both ends, and over this another in a contrary direction, so that the assemblage of gold

and vellum leaves is kept tight and close on all sides. Gold-Leaf. The whole is beaten with the heaviest hammer, and every now and then turned upside down, till the gold is stretched to the extent of the vellum; the case being from time to time opened for discovering how the extension goes on, and the packet, at times, bent and rolled as it were between the hands, for procuring sufficient freedom to the gold, or, as the workmen say, to make the gold work. The pieces, taken out from between the vellum leaves, are cut in four with a steel knife; and the 600 divisions, hence resulting, are interlaid, in the same manner, with pieces of the ox-gut skins five inches square. The beating being repeated with a lighter hammer till the golden plates have again acquired the extent of the skins, they are a second time divided in four: the instrument used for this division is a piece of cane cut to an edge, the leaves being now so light, that the moisture of the air or breath condensing on a metalline knife would occasion them to stick to it. These last divisions being so numerous, that the skins necessary for interposing between them would make the packet too thick to be beaten at once, they are parted into three parcels, which are beaten separately, with the smallest hammer, till they are stretched for the third time to the size of the skins: they are now found to be reduced to the greatest thinness they will admit of; and indeed many of them, before this period, break or fail. The French workmen, according to the minute detail of this process given in the *Encyclopédie*, repeat the division and the beating once more; but as the squares of gold, taken for the first operation, have four times the area of those used among us, the number of leaves from an equal area is the same in both methods, viz. 16 from a square inch. In the beating, however simple the process appears to be, a good deal of address is requisite, for applying the hammers so as to extend the metal uniformly from the middle to the sides: one improper blow is apt not only to break the gold leaves, but to cut the skins.

"After the last beating, the leaves are taken up by the end of a cane instrument, and, being blown flat on a leather-cushion, are cut to a size, one by one, with a square frame of cane made of a proper sharpness, or with a frame of wood edged with cane: they are then fitted into books of 25 leaves each, the paper of which is well smoothed, and rubbed with red-bole to prevent their sticking to it. The French, for sizing the leaves, use only the cane-knife; cutting them first straight on one side, fitting them into the book by the straight side, and then paring off the superfluous parts of the gold about the edges of the book. The size of the French gold leaves is from somewhat less than three inches to three and three quarters square; that of ours, from three inches to three and three-eighths.

"The process of gold-beating is considerably influenced by the weather. In wet weather, the skins grow somewhat damp, and in this state make the extension of the gold more tedious: the French are said to dry and press them at every time of using; with care not to over-dry them, which would render them unfit for further service. Our workmen complain more of frost, which appears to affect the metalline leaves themselves: in frost, a gold-leaf cannot easily

Gold-Leaf. easily be blown flat, but breaks, wrinkles, or runs together.

“Gold-leaf ought to be prepared from the finest gold; as the admixture of other metals, though in too small a proportion to sensibly affect the colour of the leaf, would dispose it to lose of its beauty in the air. And indeed there is little temptation to the workman to use any other; the greater hardness of alloyed gold occasioning as much to be lost in point of time and labour, and in the greater number of leaves that break, as can be gained by any quantity of alloy that would not be at once discoverable by the eye. All metals render gold harder and more difficult of extension: even silver, which in this respect seems to alter its quality less than any other metal, produces with gold a mixture sensibly harder than either of them separately, and this hardness is in no art more felt than in the gold-beater's. The French are said to prepare what is called the *green gold-leaf*, from a composition of one part of copper and two of silver with eighty of gold. But this is probably a mistake: for such an admixture gives no greenness to gold; and I have been informed by our workmen, that this kind of leaf is made from the same fine gold as the highest gold-coloured sort, the greenish hue being only a superficial taint induced upon the gold in some part of the process: this greenish leaf is little otherwise used than for the gilding of certain books.

“But though the gold-beater cannot advantageously diminish the quantity of gold in the leaf by the admixture of any other substance with the gold, yet means have been contrived, for some particular purposes, of saving the precious metal, by producing a kind of leaf called *party-gold*, whose basis is silver, and which has only a superficial coat of gold upon one side: a thick leaf of silver and a thinner one of gold, laid flat on one another, heated, and pressed together, unite and cohere; and being then beaten into fine leaves, as in the foregoing process, the gold, though its quantity is only about one fourth of that of the silver, continues every where to cover it, the extension of the former keeping pace with that of the latter.

LEAGUE, a measure of length, containing more or fewer geometrical paces, according to the different usages and customs of countries. A league at sea, where it is chiefly used by us, being a land-measure mostly peculiar to the French and Germans, contains 3000 geometrical paces, or three English miles. The French league sometimes contains the same measure, and in some parts of France it consists of 3500 paces: the mean or common league consists of 2400 paces, and the little league of 2000. The Spanish leagues are larger than the French, 17 Spanish leagues making a degree, or 20 French leagues, or 69½ English statute-miles. The Dutch and German leagues contain each four geographical miles. The Persian leagues are pretty near of the same extent with the Spanish; that is, they are equal to four Italian miles: which is pretty near to what Herodotus calls the length of the Persian parasang, which contained 30 stadia, eight whereof, according to Strabo, make a mile. The word comes from *leuca*, or *leuga*, an ancient Gaulish word for an itinerary measure, and retained in that sense by the Romans. Some derive the word *leuca* from *λευκος*, “white;” as the Gauls, in imi-

tation of the Romans, marked the spaces and distances of their roads with white stones.

LEAGUE also denotes an alliance or confederacy between princes and states for their mutual aid, either in attacking some common enemy, or in defending themselves. The word comes from *liga*, which in the corrupt Latin was used for a *confederacy*: *Qua quis cum alio ligatur*.

LEAGUES of the *Grisons*, are a part of Switzerland, consisting of three subdivisions, viz. the upper league, the league of the house of Gad, and the league of the ten jurisdictions. See the article SWITZERLAND.

The LEAGUE, by way of eminence, denotes that famous one on foot in France, from the year 1576 to 1593. Its intent was to prevent the succession of Henry IV. who was of the reformed religion, to the crown; and it ended with his abjuration of that faith.

The *leaguers*, or confederates, were of three kinds. The *zealous leaguers* aimed at the utter destruction, not only of the Huguenots, but also of the ministry. The *Spanish leaguers* had principally in view the transferring the crown of France to the king of Spain, or the infantina his daughter. The *moderate leaguers* aimed only at the extirpation of Calvinism, without any alteration of the government.

LEAK, at sea, is a hole in the ship, thro' which the water comes in. A ship is said to *spring a leak*, when she begins to *leak* or to let in the water. The manner of stopping a leak is to put into it a plug wrapped in oakum and well tarred, or in a tarpawling clout, which keeps out the water, or nailing a piece of sheet lead on the place.—Seamen sometimes stop a leak by thrusting a piece of salt beef into it. The seawater, says Mr Boyle, being fresher than the brine imbibed by the beef, penetrates into its body, and causes it to swell so as to bear strongly against the edges of the broken plank, and thereby stops the influx of the water.—A ready way to find a leak in a ship is to apply the narrower end of a speaking trumpet to the ear, and the other to the side of the ship where the leak is supposed to be; then the noise of the water issuing in at the leak will be heard distinctly, whereby it may be discovered.

LEAKAGE, the state of a vessel that leaks, or lets water or other liquid ooze in or out.

LEAKAGE, in commerce, is an allowance of 12 per cent. in the customs, allowed to importers of wines for the waste or damage it is supposed to have received in the passage: an allowance of two barrels in 22 is also made to the brewers of ale and beer, by the excise-office.

LEAKE (Richard), master-gunner of England, was born at Harwich in 1629, and was bred to the sea. At the restoration, he was made master-gunner of the Princess, a frigate of 50 guns; and in the first Dutch war distinguished himself by his skill and bravery in two extraordinary actions; one against 15 sail of Dutch men of war; and another in 1667 against two Danes in the Baltic, in which the commanding officers of the Princess being killed or desperately wounded, the command, according to the rules of war at that time, fell to the gunner. In 1669, he was promoted to be gunner of the Royal Prince, a first-rate man

of war. He was engaged, with his two sons Henry and John, in the battle against Van Tromp, in 1673; when the Royal Prince had all her masts shot away, near 400 of her men killed and disabled, and most of her upper tier of guns dismounted. As she lay thus like a wreck, a great Dutch man of war came down upon her with two fire-ships, either to burn or carry her off; and Captain Rooke, afterwards Sir George, thinking it impossible to defend her, ordered the men to save their lives, and the colours to be struck. Mr Leake hearing this, ordered the lieutenant off the quarter-deck, and took the command upon himself, saying, "The Royal Prince shall never be given up to the enemy while I am alive to defend her." The undaunted spirit of the brave gunner inspired the small residue of the ship's company with resolution: they returned with alacrity to the fight, and, under the direction of this valiant gunner and his two sons, sunk both the fire-ships, and obliged the man of war to sheer off; and having thus saved the Royal Prince, he brought her into Chatham. But Mr Leake's joy in obtaining this victory was damped by the loss of Henry, his eldest son, who was killed near him. Soon after, Mr Leake was preferred to the command of a yacht, and also made gunner of Whitehall. In 1677, he obtained a grant for life of the office of master-gunner of England, and store-keeper of the ordnance at Woolwich. By these posts he had full scope for his genius. He accordingly, among other things, invented the cushion-piece; and contrived to fire a mortar by the blast of a piece, which has been used ever since. He was also the principal contriver of what the French call *infernaux*, used at the bombardment at St Malo's in 1693. Mr Leake had a surprising genius for all inventions of this kind; and had frequent trials of skill with French and Dutch gunners and engineers in Woolwich warren, at which king Charles II. and the duke of York were often present, and he never failed to excel all his competitors: nor was he less skilled in the art of making compositions for fireworks; of which he likewise made frequent trials, with equal success.

LEAKE (Sir John), an English admiral, distinguished by his bravery and success, was born in 1656, and was taught mathematics and gunnery by Mr Richard Leake, his father, who was master-gunner of England. Entering early into the navy, he distinguished himself under his father in 1673, in the memorable engagement between Sir Edward Spragg and Van Tromp, when but 16 years of age; and being afterwards made captain, he signalized himself, among other occasions, by executing the desperate attempt of conveying some victuals into Londonderry, which obliged the enemy to raise the siege; and at the famous battle of La Hogue. In 1702, being made commodore of a squadron, he destroyed the French trade and settlements at Newfoundland, and restored the English to the possession of the whole island. On his return he was created rear-admiral; soon after, he was made vice-admiral of the blue, and was afterwards knighted. He was engaged with admiral Rook in taking Gibraltar: soon after which, he particularly distinguished himself in the general engagement off Malaga; when, commanding the leading squadron of the van, consisting only of six ships, he drove that of the

enemy consisting of 13, out of the line of battle, so disabled that they never returned to the fight. In 1705, he relieved Gibraltar, which the French had besieged by sea, and the Spaniards by land, so seasonably, that the enemy was to have attacked the town that very night in several places, and would undoubtedly have made themselves masters of it. Five hundred Spaniards had, by the help of rope-ladders, climbed up the rocks by a way that was thought inaccessible. At the same time they had got a great number of boats to land 3000 men at the New Mole, who, by making a vigorous assault on the side next the sea, were to draw the garrison to oppose that attack, while the 500 concealed men rushed into the town. These being the next day drawn by hunger out of their ambuscade, were discovered; on which Sir John assisting the garrison with sailors and marines, they were attacked with such vigour, that, though they had taken an oath not to surrender to the English, 190 common soldiers and 30 officers took quarter; 200 were killed on the spot; and the rest, who endeavoured to make their escape, fell headlong down the rock. He was soon after made vice-admiral of the white, and then twice relieved that fortress. The last time, he attacked five ships of the French fleet coming out of the bay, of whom two were taken, and two run ashore and were destroyed: baron Pointi died soon after, of the wounds he received in the battle; and in a few days the enemy raised the siege.

In the year 1705, Sir John was engaged in the reduction of Barcelona; and the next year relieved that city, when it was reduced to the last extremity, and obliged king Philip to raise the siege. Soon after he took the city of Carthagea; from whence proceeding to Alicant and Joyce, both these submitted to him; and he concluded the exploits of that year with the reduction of the city and island of Majorca. Upon his return home, prince George of Denmark made him a present of a ring valued at 400 l. and he had the honour of receiving 1000 l. from the queen as a reward for his services. Upon the unhappy death of Sir Cloudesly Shovel, in 1707, he was made admiral of the white, and commander in chief of her majesty's fleet; and the next year, surprising a convoy of the enemy's corn, he sent it to Barcelona, and thus saved both that city and the confederate army from the danger of famine: soon after, conveying the new queen of Spain to king Charles her consort, her majesty made him a present of a diamond ring of 500 pounds value. He then proceeded to the island of Sardinia, which he reduced to the obedience of king Charles; and soon after assisted the lord Stanhope in the conquest of Minorca.

Then returning home, he was appointed one of the council to the lord high admiral; and in 1709, was made rear-admiral of Great Britain. He was several times chosen member of Parliament for Rochester; and in 1712, conducted the English forces to take possession of Dunkirk. But upon the accession of king George I. he was superseded, and allowed a pension of 600 l. a-year. After this, he lived privately till his death, which happened at his house in Greenwich in 1720.

LEANDER, in poetic history, a young man of Abydos in Asia. He used to swim over the Helles-

Leao  
 1. ear.

spent by night to visit Hero his mistress, who set forth a light to guide him: but in a tempestuous winter-night, he was drowned; upon which Hero seeing him dead on the shore, cast herself headlong from the tower, and died also.

LEAO, in natural history, a mineral substance approaching to the nature of the lapis lazuli, found in the East Indies, and of great use in the Chinese porcelain manufactures, being the finest blue they are possessed of. This stone is found in the strata of pit-coal; or in those of a yellowish or reddish earth in the neighbourhood of the veins of coal. There are often found pieces of it lying on the surface of the ground, and these are a sure indication that more will be found on digging. It is generally found in oblong pieces of the size of a finger, not round, but flat. Some of this is very fine, and some coarse and of a bad colour. The latter is very common; but the fine sort is scarce, and greatly valued. It is not easy to distinguish them at sight, but they are found by experiment; and the trying one piece is generally sufficient for judging of the whole mine, for all that is found in the same place is usually of the same sort.

The manner of preparing it for use is this: They first wash it very clean, to separate it from the earth or any other foulness it may have: they then lay it at the bottom of their baking furnaces; and when it has been thus calcined for three or four hours, it is taken out, and powdered very fine in large mortars of porcelain with stone pestles faced with iron. When the powder is perfectly fine, they pour in boiling water, and grind that with the rest, and when it is thoroughly incorporated, they add more, and finally pour it off after some time settling. The remainder at the bottom of the mortar, which is the coarser part, they grind again with more water; and so on, till they have made the whole fine, excepting a little dirt or grit. When this is done, all the liquors are mixed together, and well stirred. They are suffered to stand two or three minutes after this, and then poured off with the powder remaining in them: this is suffered to subside gradually, and is the fine blue used in their best works, our common finest serving for the blue of all the common china ware.

LEAP, in music, is when the song does not proceed by conjoint degrees, as when between each note there is an interval of a third, a fourth, fifth, &c.

Leap Year. See YEAR, and ASTRONOMY, n° 292.

LEAPING, or VAULTING. See VAULTING.

LEAR, the name of a British king said in old chronicles to have succeeded his father Bladud, about A. M. 3160. The story of this king and his three daughters, is well known from Shakespeare's excellent tragedy founded on it.

LEASE and RELEASE, a species of conveyance used in the English law, first invented by serjeant Moore, soon after the statute of uses, and now the most common of any, and therefore not to be shaken; though very great lawyers, (as particularly Mr Noy), have formerly doubted its validity. It is thus contrived. A lease, or rather bargain and sale, upon some pecuniary consideration, for one year, is made by the tenant of the freehold to the lessee or bargainee. Now this, without any enrollment, makes the bargainor stand seized to the use of the bargainee, and vests in the bar-

gaince the use of the term for a year; and then the statute immediately annexes the possession. He therefore, being thus in possession, is capable of receiving a release of the freehold and reversion, which must be made to a tenant in possession; and accordingly, the next day, a release is granted to him. This is held to supply the place of livery of seisin; and so a conveyance by lease and release is said to amount to a conveyance.

LEASH, among sportsmen, denotes three creatures of any kind; but chiefly greyhounds, foxes, bucks, and hares.

The term *leash* also signifies a line to hold in a hunting dog; and a small long thong of leather, by which a falconer holds his hawk.

LEASING-MAKING, in Scots law, the uttering of words tending to excite discord between the king and his people; also called *verbal sedition*.

LEATHER, the skin of several sorts of beasts dressed and prepared for the use of various manufacturers, whose business it is to make them up.

DYEING of Leather, Skins, &c. Blue is given by steeping the subject a day in urine and indigo, then boiling it with alum: or it may be given by tempering the indigo with red-wine, and washing the skins therewith. Red is given by washing the skins, and laying them two hours in galls, then wringing them out, dipping them in a liquor made with ligu-strum, alum, and verdigraese in water; and lastly, in a dye made of brazil wood, boiled with ley. Purple is given by wetting the skins with a solution of roche alum in warm water; and, when dry again, rubbing them with the hand with a decoction of log-wood in colder. Green is given by smearing the skin with sap-green and alum-water boiled. Dark-green is also given with steel-slings and sal armoniac steeped in urine till soft, then smeared over the skin; which is to be dried in the shade. Sky-colour is given with indigo steeped in boiling water, and the next morning warmed and smeared over the skin. Yellow, by smearing the skin over with aloe and linseed-oil dissolved and strained; or by infusing it in weld. Orange-colour is given by smearing with rustic berries boiled in alum-water; or, for a deep orange, with turmeric.

Processes for Dyeing LEATHER Red and Yellow as practised in Turkey, with directions for Preparing and Tanning the Skins; as communicated by Mr Philippo, a native of Armenia, who received from the Society for the Encouragement of Arts, &c. one hundred pounds, and also the gold medal of the Society, as a reward for discovering this secret.

1. First Preparation of the Skins, both for Red and Yellow Leather, by dressing them in Lime. Let the skins, dried with the hair on, be first laid to soak in clean water for three days; let them then be broken over the flesh-side, put into fresh water for two days longer, and afterwards hung up to drain half an hour. Let them now be broken on the flesh-side, limed in cold lime on the same side, and doubled together with the grain-side outward. In this state they must be hung up within-doors over a frame for five or six days, till the hair be loose; which must then be taken off, and the skins returned into the lime-pit, for about three weeks. Take them out, and let them be well worked flesh and grain, every sixth or seventh day during that time:

Leash  
 Leather.

time: after which, let them be washed ten times in clear water, changing the water at each washing. They are next to be prepared in drench, as below mentioned.

2. *Second Preparation of the Skins for both the Red and Yellow Dyes by drenching.* After squeezing the water out of the skins, put them into a mixture of bran and water, warm as new milk, in the following proportions; viz. about three pounds of bran for five skins, and water sufficient to make the mixture moderately fluid, which will be about a gallon to each pound of bran. In this drench let the skins lie three days; at the end of which time they must be well worked, and afterwards returned into the drench two days longer. They must then be taken out and rubbed between the hands; the water squeezed from them, and the bran scraped off clear from both sides of the skins. After this they must be again washed ten times in clear water, and the water squeezed out of them.

Thus far the preparatory proofs of all the skins, whether intended to be dyed red or yellow, is the same; but afterwards those which are to be dyed red, must be treated as follows.

3. *Preparation in Honey and Bran of the Skins that are to be dyed Red.* Mix one pound of honey with three pints of luke-warm water, and stir them together till the honey is dissolved. Then add two double handfuls of bran; and taking four skins (for which the above quantity of the mixture will be sufficient) work them well in it one after another. Afterwards fold up each skin separately into a round form, with the flesh-side inwards; and lay them in an earthen pan, or other proper vessel; if in the summer, by the side of each other; but in the winter, on the top of each other. Place the vessel in a sloping position, so that such part of the fluid as may spontaneously drain from the skins, may pass from them. An acid fermentation will then rise in the liquor, and the skins will swell considerably. In this state they must continue for seven or eight days; but the moisture that drains from them must be poured off, once or twice a-day, as occasion may require. After this a further preparation in salt is necessary; and which must be performed in the following manner.

4. *Preparation in Salt, of the Skins to be dyed Red.* After the skins have been fermented in the honey and bran, as abovementioned, let them be taken out of that mixture on the eighth or ninth day, and well rubbed with dry common sea-salt, in the proportion of about half a pound to each skin; the salt must be well rubbed and worked with them. This will make them contract again, and part with a further considerable quantity of moisture; which must be squeezed out by drawing each skin separately through the hands. They must next be scraped clean on both sides from the bran, superfluous salt, and moisture that may adhere to them. After which, dry salt must be strewn over the grain-side, and well rubbed in with the hand. They are

then to be doubled with the flesh-side outwards, lengthwise from neck to tail, and a little more dry salt must be thinly strewn over the flesh-side, and rubbed in; for the two last operations, about a pound and a half of salt will be sufficient for each skin. They must then be put, thus folded on each other, between two clean boards, placed sloping, breadthwise; and a heavy weight laid on the upper board, in order gradually to press out what moisture they will thus part with. In this state of pressure, they must be continued two days or longer, till it is convenient to dye them, for which they will then be duly prepared.

5. *Preparation of the Red Dye, in a proper proportion for four skins.* Put eight gallons of water into a copper, with seven ounces of shenan (A) tied up in a linen bag. Light a fire under a copper; and when the water has boiled about a quarter of an hour, take out the bag of shenan, and put into the boiling fluid or lixivium, 1lb. two drams of alum; 2dly, two drams pomegranate bark; 3dly, three quarters of an ounce of turmeric; 4thly, three ounces of cochineal; 5thly, two ounces of loaf-sugar. Let the whole mixture boil about six minutes, then cover the fire, and take out a quart of liquor, putting it into a flat earthen pan; and when it is as cold as new milk, take one skin, folded lengthwise, the grain-side outwards, and dip it in the liquor, rubbing it gently with the hands. Then taking out the skin, hang it up to drain, and throw away the superfluous dye. Proceed in the same manner with the remaining three skins; repeating the operation of each skin separately, eight times, squeezing the skins by drawing them through the hands before each fresh dipping. Lay them now on one side of a large pan, set sloping, to drain off as much of the moisture as will run from them without pressure, for about two hours, or till they are cold; then tan them as below directed.

6. *Tanning the Red Skins.* Powder four ounces of the best white galls in a marble mortar, sifting it thro' a fine sieve. Mix the powder with about three quarts of water, and work the skins well in this mixture for half an hour or more, folding up the skins four-fold. Let them lie in this tan for 24 hours; when they must be worked again as before; then taken out, scraped clean on both sides from the first galls, and put into a like quantity of fresh galls and water. In this fresh mixture they must be again well worked for three quarters of an hour; then folded up as before, and left in the fresh tan for three days. On the fourth day they must be taken out, washed clean from the galls in seven or eight fresh quantities of water, and then hung up to dry.

7. *Manner of Dressing the Skins after they are tanned.* When the skins have been treated as above, and are very near dry, they should be scraped with the proper instrument or scraper on the flesh-side, to reduce them to a proper degree of thickness. They are then to be laid on a smooth board, and glazed by rubbing them

(A) Shenan is a drug much used by dyers in the East; and may easily be procured at any of the ports of Syria and Africa, in the Levant. It is the Eastern jointed-kali, called by botanists *salicornia*; and grows in great plenty in those and other parts of the East. There is a lesser species of the *salicornia* on our coast, which, from its great affinity with the shenan, might be presumed to have the same qualities. On some trials, however, it has not appeared to answer the intention of the shenan; but it will be prudent to pursue the examination of this further, as some unknown circumstances in the soil, or in the English *salicornia* might occasion the miscarriage. But be this as it may, the Eastern shenan may, at all events, be easily procured in any quantity, at a very trifling expence, by any of the captains of Turkey ships, at Aleppo, Smyrna, &c.

Leather.

with a smooth glass. After which they must be oiled, by rubbing them with olive-oil, by means of a linen rag, in the proportion of one ounce and a half of oil for four skins: they are then to be grained on a graining board, lengthwise, breadthwise, and cornerwise, or from corner to corner.

8. *Preparation with Galls, for the Skins to be dyed Yellow.* After the four skins are taken out of the drench of bran, and clean washed as before directed in the second article, they must be very well worked, half an hour or more, in a mixture of a pound and a half of the best white galls, finely powdered, with two quarts of clean water. The skins are then to be separately doubled lengthwise; rolled up with the flesh-side outwards, laid in the mixture, and close pressed down on each other, in which state they must continue two whole days. On the third day let them be again worked in the tan; and afterwards scraped clean from the galls, with an ivory or brags instrument (for no iron must touch them.) They must then be put into a fresh tan, made of two pounds of galls finely powdered, with about three quarts of water, and well worked therein 15 times. After this they must be doubled, rolled up as before, and laid in the second tan for three days. On the third day a quarter of a pound of white sea-salt must be worked into each skin; and the skins doubled up as before, and returned into the tan, till the day following, when they are to be taken out, and well washed six times in cold water, and four times in water lukewarm. The water must be then well squeezed out, by laying the skins under pressure, for about half an hour, between two boards, with a weight of about 200 or 300 pounds laid upon the uppermost board, when they will be ready for the dye.

9. *Preparation of the Yellow Dye, in the proper proportion for four skins.* Mix six ounces of cassia gerahira (a), or dgehira, or the berries of the eastern rhamnus, with the same quantity of alum; and pound them together till they be fine, in a marble or brags mortar, with a brags pestle. Then dividing the materials, thus powdered, into three equal parts of four ounces each, put one of those three parts into about a pint and a half of water, in a china or earthen vessel; and stir the mixture together. Let the fluid stand to cool, till it will not scald the hand. Then spreading one of the skins flat on a table, in a warm room, with the grain-side uppermost, pour a fourth part of the tinging liquor, prepared as above directed, over the upper or grain-side, spreading it equally over the skin with the hand, and rubbing it well in. Afterwards do the like with the other three skins, for which the mixture first made will be sufficient.

This operation must be repeated twice more on each skin separately, with the remaining eight ounces of the powder of the berries, and slum, with the abovementioned due proportions of hot water, put to them as before directed.

The skins, when dyed, are to be hung up on a wooden frame, without being folded, with the grain-side outwards, about three quarters of an hour to drain; when they must be carried to a river or stream of run-

ning water, and well washed therein six times or more. After this they must be put under pressure for about an hour, till the water be well squeezed out; afterwards the skins must be hung up to dry in a warm room.

This being done, the skins are to be dressed and grained as before directed for those dyed red; except the oiling, which must be omitted.

*Blackening LEATHER.* In the tanning of leather it is so much impregnated with the astringent parts of oak-bark, or with that matter which strikes a black with green vitriol, that rubbing it over three or four times with a solution of the vitriol, or with a solution of iron made in vegetable acids, is sufficient for staining it black. Of this we may be convinced by dropping a little of the solution on unblackened side of common shoe-leather. This operation is performed by the currier; who, after the colouring, gives a gloss to the leather with a solution of gum-arabic and size made in vinegar. Where the previous astringent impregnation is insufficient to give due colour, and for those sorts of leather which have not been tanned, some galls or other astringents are added to the solution of iron; and in many cases, particularly for the finer sorts of leather, and for renewing the blackness, ivory or lamp-black are used. A mixture of either of these with linseed oil makes the common oil-blackening. For a shining blacking, small beer or water are taken instead of oil, in the quantity of about a pint to an ounce of the ivory-black, with the addition of half an ounce of brown sugar and as much gum-arabic. The white of an egg, substituted for the gum, makes the black more shining, but is supposed to hurt the leather, and make it apt to crack. It must be obvious, however, that all these compositions admit of a great many variations.

*Gilding of LEATHER.* Take glair of the whites of eggs, or gum water, and with a brush rub over the leather with either of them; then lay on the gold or silver, and, letting them dry, burnish them. See the articles GILDING and BURNISHING.

*To dress or cover LEATHER with Silver or Gold.* Take brown-red; grind or move it on a stone with a muller, adding water and chalk; and when the latter is dissolved, rub or lightly daub the leather over with it, till it looks a little whitish; and then lay on the leaf-silver or gold before the leather is quite dry, laying the leaves a little over each other, that there may not be the least part uncovered; and when they have well clofed with the leather, and are sufficiently dried on and hardened, rub them over with an ivory polisher, or the foretooth of a horse.

LEAVEN, a piece of four dough, used to ferment and render light a much larger quantity of dough or paste. See BREAD, BARM, and BAKING.

LEAVES of PLANTS. See LEAF.

Colours extracted from LEAVES. See COLOUR-Making, n° 36.

LEBEDA, an ancient sea-port town of Africa, in the kingdom of Tripoli, with a pretty good harbour, and an old castle; seated on the Mediterranean Sea, in E. Long. 14. 50. N. Lat. 32. 10.

LEBRIXA, an ancient, strong, and pleasant town

Leather.

Lebrixa.

(a) The cassia gerahira is the berries of an Eastern rhamnus, or buckthorn-tree; and may be had at Aleppo, and other parts of the Levant, at a small price. The common Avignon or yellow berries may be substituted, but not with so good an effect; the cassia gerahira being a stronger and brighter yellow dye, both for this use, and also that of colouring paper-hangings, &c.

ebus  
bury.  
town of Spain, in Andalusia; seated in a territory abounding in corn, wine, and a great number of olive-trees, of whose fruit they make the best oil in Spain. W. Long. 5. 32. N. Lat. 36. 52.

LEBUS, a town of Germany, in the circle of Upper Saxony, and in the marquisate of Brandenburg, with a bishop's see, secularized in favour of the house of Brandenburg. It is seated on the river Oder, in E. Long. 14. 55. N. Lat. 52. 28.

LECCE, a rich, populous, and most beautiful town of Italy, in the kingdom of Naples and in the Terra d'Otranto, of which it is the chief place, and the see of a bishop. E. Long. 18. 20. N. Lat. 40. 38.

LECCO, a town of Italy, in the duchy of Milan, seated on the eastern side of the lake Como. E. Long. 9. 40. N. Lat. 45. 45.

LECHLADE, a town of Gloucestershire in England, seated at the confluence of the river Lech with the Thames. W. Long. 2. 15. N. Lat. 51. 42.

LECHNICH, a town of Germany in the circle of the Lower Rhine, and in the electorate of Cologne. E. Long. 6. 35. N. Lat. 50. 40.

LECTICA, among the Romans, a litter or vehicle in which people were carried. The *fella* differed from the *lectica*, as being higher, and because people always sat in it; on which account the *fella*, from the time it was first brought into use, was esteemed the more honourable carriage of the two. The *lectica* was also used as a bier for carrying out the dead, who were dressed in habits suitable to their quality and sex.

LECTISTERNUM, a religious feast or banquet of the ancient Romans. In times of public danger or calamity, or of thanksgiving for some happy event, the republic ordered solemn feasts to be made for the gods; and this solemnity was called *lectisternum*, because on this occasion they spread tables, and placed beds around them, on which their heavenly guests were to lie and eat.

LECTORES, among the Romans, servants in great mens houses, who were employed in reading while their masters were at supper. They were called by the Greeks *ANAGNOSTÆ*.

LECTOURE, an ancient and strong town of France, in Gascony, with a castle and a bishop's see; seated on a mountain at the foot of which runs the river Gers. E. Long. 0. 42. N. Lat. 43. 56.

LECTURERS, in England, are an order of preachers in parish-churches, distinct from the rector or vicar. They are chosen by the vestry, or chief inhabitants of the parish, and are usually the afternoon preachers.

The law requires, that they have the approbation and admission of the ordinary; and that, at the time of their admission, they subscribe to the 39 articles of religion, &c. required by the statute 14 Car. II. and they are to be licensed by the bishop, like other ministers.

Where there are lectures founded by the donations of pious persons, the lecturers are appointed by the founders, without any interposition or consent of rectors of churches, &c. though with the leave and approbation of the bishop; such as that of lady Moyer, at St Paul's.

LEDBURY, a town of Herefordshire in England. It is a well-built town seated on a rich clay soil, and

inhabited mostly by clothiers, who carry on a pretty large trade. W. Long. 2. 27. N. Lat. 52. 6.

LEDESMA, an ancient and strong town of Spain, in the kingdom of Leon, seated on the river Tome, in W. Long. 5. 25. N. Lat. 47. 2.

LEDGER, the principal book wherein merchants enter their accounts. See BOOK-KEEPING.

LEDUM, MARSH CISTUS, or *Wild Rosemary*; a genus of the monogynia order, belonging to the decandria class of plants. There is but one species, viz. the palustris with very narrow leaves. This grows naturally upon bogs and mosses in many parts of Yorkshire, Cheshire, and Lancashire; rising with a slender shrubby stalk about two feet high, dividing into many slender branches, garnished with narrow leaves, not much unlike those of heath. The flowers are produced in small clusters at the end of the branches, and are shaped like those of the strawberry-tree, but spread open wider at top. These are of a reddish colour, and in the natural places of their growth are succeeded by seed-vessels filled with small seeds which ripen in autumn.—This plant is with great difficulty kept in a garden; for as it naturally grows upon bogs, unless the plants have a similar soil, they will not thrive. They must be procured from the places of their growth, and taken up with good roots, otherwise they will not live.

LEE, an epithet used by seamen to distinguish that part of the hemisphere to which the wind is directed, from the other part whence it arises; which latter is accordingly called to *windward*. This expression is chiefly used when the wind crosses the line of a ship's course, so that all on a side of her is called to *windward*, and all on the opposite side to *leeward*. Hence,

Under the LEE, implies farther to the leeward, or farther from that part of the horizon whence the wind blows; as,

Under the LEE of the Shore; i. e. at a short distance from the shore which lies to windward. This phrase is commonly understood to express the situation of a vessel anchored, or sailing under the weather-shore, where there is always smoother water, and less danger of heavy seas, than at a great distance from it.

LEE-Larches, the sudden and violent rolls which a ship often takes to the leeward in a high sea, particularly when a large wave strikes her on the weather-side.

LEE-Side, all that part of a ship or boat which lies between the mast and the side farthest from the direction of the wind; or otherwise, the half of a ship, which is pressed down towards the water by the effort of the sails, as separated from the other half by a line drawn through the middle of her length. That part of the ship, which lies to windward of this line, is accordingly called the *weather-side*.

Thus admit a ship to be sailing southward, with the wind at east, then is her starboard, or right side, the *lee side*; and the larboard, or left, the *weather-side*.

LEEWARD-SHIP, a vessel that falls much to leeward of her course, when sailing close-hauled, and consequently loses much ground.

To LEEWARD, towards that part of the horizon which lies under the lee, or whither the wind bloweth. Thus, "We saw a fleet under the lee," and, "We saw a fleet to leeward," are synonymous expressions.

LEE-

Leidesma  
||  
Lee.

Lee. LEE-Way. See NAVIGATION, Sect. ix. Leeds. LEE (Nathaniel), a very eminent dramatic poet of the last century, was the son of a clergyman, who gave him a liberal education.—He received his first rudiments of learning at Westminster school; from whence he went to Trinity-college, Cambridge.—Coming to London, however, his inclination prompted him to appear on the theatre; but he was not more successful in representing the thoughts of other men, than many a genius besides, who have been equally unfortunate in treading the stage, although they knew so well how to write for it. He produced 11 tragedies, all of which contain a very great portion of true poetic enthusiasm.—None, if any, ever felt the passion of love more truly; nor could any one describe it with more tenderness. Addison commends his genius highly; observing, that none of our English poets had a happier turn for tragedy, although his natural fire and unbridled impetuosity hurried him beyond all bounds of probability, and sometimes were quite out of nature. The truth is, this poet's imagination ran away with his reason; so that at length he became quite crazy; and grew so bad, that his friends were obliged to confine him in bedlam, where he made that famous witty reply to a coxcomb scribbler, who had the cruelty to jeer him with his misfortune, by observing that it was an easy thing to write like a madman:—"No, (said Lee), it is not an easy thing to write like a madman; but it is very easy to write like a fool."

Lee had the good fortune to recover the use of his reason so far as to be discharged from his melancholy confinement; but he did not long survive his enlargement, dying at the early age of 34. Cibber, in his Lives of the Poets, says he perished unfortunately in a night-ramble, in London streets.—His Theodosius and Alexander the Great are stock-plays, and to this day are often acted with great applause. The late Mr Barry was particularly fortunate in the character of the Macedonian Hero.

LEECH, in zoology. See HIRUDO.

LEECHES in a ship, the borders or edges of a sail which are either sloping or perpendicular.

The leeches of all sails whose tops and bottoms are parallel to the deck, or at right angles to the mast, are denominated from the ship's side, and the sail to which they belong; as the *starboard* leech of the main-sail, the *lee-leech* of the fore-top-sail, &c. But the sails which are fixed obliquely on the masts have their leeches named from their situation with respect to the ship's length; as the *fore-leech* of the mizen, the *after-leech* of the jib or fore-stay sail, &c.

LEECR-Lines, certain ropes fastened to the middle of the leeches of the main-sail and fore-sail, and communicating with blocks under the opposite sides of the top, whence they pass downwards to the deck, serving to truss up those sails to the yard as occasion requires. See BRAILS.

LEECR-Rope, a name given to that part of the bolt-rope to which the border or skirt of a sail is sewed. In all sails whose opposite leeches are of the same length, it is terminated above the earing, and below the clue. See BOLT-ROPE, CLUE, and EARING.

LEEDS, a town of the West Riding of Yorkshire in England, in W. Long. 1. 17. N. Lat. 53. 48. It

stands on the north side of the river Aire, over which it has a stately stone bridge, hath been long famous for the woollen manufacture, and is one of the largest and most flourishing towns in the county. On a market-day one may see a long street full of standings, and these filled with cloth for sale. Of this cloth large quantities are shipped off at Hull, for Holland, Hamburg, and the North; whence they are dispersed through the Netherlands, Germany, Poland, &c. John Harrison, Esq; a native of this town, was a great benefactor to it, by building and endowing a church, hospital, and free-school. The corporation consists of a mayor, 12 aldermen, and 24 assistants. On the market-days, when the market-bell rings, which is at seven in the morning in winter, and six in summer, the clothiers bring out their cloth from the inns; and when the bell ceases, the chapmen come into the market, match their patterns, and in an hour's time, perhaps, bargain for 20,000*l.* worth. The bell rings again at half an hour past eight, upon which the clothiers give place to the linen-draper, hardware-men, shoemakers, fruiterers, &c. There have been 500 loads of apples belonging to the laith of these here upon a market-day. At the same time there is an equal plenty and variety of fish and butchers-meat exposed to sale. Great quantities also of white cloth are sold in a magnificent hall, where notice is given by a bell when the sale begins. Not only woollen goods, but coals and other commodities, are conveyed from hence by the Aire to Wakefield, York, and Hull. In a house here, called *Red-hall*, there is an apartment in which king Charles I. lodged, and which, on that account, still bears the name of the *king's chamber*. There was a castle here anciently; and now there is a stately town-hall, and parochial church called *St Peter's*. On the roof of it, the delivering of the law by Moses is finely painted in fresco. Here are also two charity-schools, a work-house, several alms-houses, and meeting-houses, one of which last, belonging to the Presbyterians, is a very handsome building. This town gives the title of *duke* to the family of Osborn, and has several medicinal springs about it.

LEEK, in botany. See ALLIUM.

LEEK, a town of Staffordshire in England. It is seated in barren moor-lands, but its market is very good. W. Long. 2. N. Lat. 53. 6.

LEERWICK, the capital town of Shetland, situated in the island called the *Mainland*, in W. Long. 1. 30. N. Lat. 61. 20. It contains about 300 families.

LEES, the grossest and most ponderous parts of liquors, which, being separated by fermentation, fall to the bottom. The word comes from the French *liez*; and that either from *limus* "mud," or from *Lyeur* one of the surnames of Bacchus; or, according to du Cange, from *lia*, a corrupt Latin word, signifying the same.—The vinegar-makers make a great trade of the lees of wine dried and made into cakes, after having squeezed out the remains of the liquor in presses.

LEET, a little court held within a manor, and called the *king's court*, on account that its authority to punish offences originally belonged to the crown, from whence it is derived to inferior persons.

LEEWARD, at sea. See TO LEEWARD, above. LEE-

and LEeward-Islands, in the West-Indies, a name given to the CARIBBEES.

LEG, in anatomy, the whole lower extremity from the acetabula of the ossa innominata, commonly divided into three parts, viz. the thigh, the leg properly so called, and the foot. See ANATOMY, n<sup>o</sup> 59.

LEGACY, in Scots law, a donation by one person to another, to be paid by the giver's executor after his death. See LAW, N<sup>o</sup> clxxxi. 3.

LEGATEE, in Scots law, the person to whom a legacy is provided.

LEGATE, a cardinal or bishop, whom the pope sends as his ambassador to sovereign princes. See AMBASSADOR.

There are three kinds of legates, viz. legates *a latere*, legates *de latere*, and legates by office, or *legati nati*: of these the most considerable are the legates *a latere*, the next are the legates *de latere*. See the article LATERE.

Legates by office are those who have not any particular legation given them; but who, by virtue of their dignity and rank in the church, become legates: such are the archbishop of Rheims and Arles: but the authority of these legates is much inferior to that of the legates *a latere*.

The power of a legate is sometimes given without the title. Some of the nuncios are invested with it. It was one of the ecclesiastical privileges of England from the Norman conquest, that no foreign legate should be obtruded upon the English, unless the king should desire it upon some extraordinary emergency, as when a case was too difficult for the English prelates to determine.

The term *legate* comes from *legatus*, which Varro derives from *legere*, "to choose;" and others from *legare*, *delegare*, "to send, delegate."

LEGATUS, in Roman antiquity, a military officer who commanded as deputy of the chief general. The

design of the *legati* at their first institution, was not so much to command as to advise. They were chosen by the consuls, the authority of the senate concurring with their nomination. There were two kinds of *legati*, viz. a *legatus* in the army, under the emperor or general, who commanded in chief under him, and managed all affairs by his permission; and a *legatus* in the provinces under the proconsul or governor, in whose absence the *legatus* had the honour to use the *fasces*, and was intrusted with the same charge as the office he represented. As to the number of the *legati* we have no certainty, but may suppose that this depended upon the pleasure of the general, &c. Under the emperors, there were two sorts of *legati*; *consulares* and *prætorii*: the first of whom commanded whole armies, as the emperor's lieutenant-generals; and the others, only particular legions.

LEGEND, any idle or ridiculous story told by the Romanists concerning their saints, and other persons, in order to support the credit of their religion.

The *legend* was originally a book used in the old Romish churches, containing the lessons to be read at divine service; hence the lives of the saints and martyrs came to be called *legends*, because chapters were read out of them at matins, and at the refectories of religious houses. Among these the *golden legend*, which is a collection of the lives of the saints, was received in the church with great applause, which it maintained for 200 years; though it is so full of ridiculous and romantic stories, that the Romanists themselves are now ashamed of it.

LEGEND is also used to signify the words or letters engraven about the margins, &c. of coins. Thus the *legend* of a French crown is, *Sit nomen Domini benedictum*; that of a moidore, *In hoc signo vinces*; on those of the last emperors of Constantinople, we find *Iesus Christus Basileus Basileon*, *IHS XPS NIKA*, *Iesus Christus vincit*.

## L E G E R D E M A I N,

### OR SLEIGHT of HAND;

A DENOMINATION given to certain deceptive performances, which either depend altogether on dexterity and address, or derive but a small degree of aid from philosophical principles. Of these we shall present our readers with a selection of the best that have been either explained in books, or publicly exhibited.

#### SECT. I. Performances with the Cards.

BEFORE to the performances with cards, it will be necessary to explain the method of *making the pass*; that is, bringing a certain number of cards from the bottom of the pack to the top; as many of these performances depend on that manœuvre.

1. Hold the pack of cards in your right hand, so that the palm of your hand may be under the cards: place the thumb of that hand on one side of the pack, the first, second, and third fingers on the other side, and your little finger between those cards that are to be

brought to the top and the rest of the pack. Then place your left hand over the cards, in such a manner that the thumb may be at C, (fig. 20, 21.) the fore-Plate C finger at A, and the other fingers at B.

The hands and the two parts of the cards being thus disposed, you draw off the lower cards confined by the little finger and the other parts of the right hand, and place them, with an imperceptible motion, on the top of the pack.

It is quite necessary, before you attempt any of the experiments that depend on making the pass, that you can perform it so dexterously that the eye cannot distinguish the motion of your hand; otherwise, instead of deceiving others, you will expose yourself. It is also proper that the cards make no noise, as that will occasion suspicion. This dexterity is not to be attained without some practice.

There is a method of preparing a pack of cards, by inserting one or more that are a small matter longer or wider

wider than the rest; which preparation will be necessary in several of the following experiments.

<sup>2</sup> The card of divination. 2. Have a pack in which there is a long card; open the pack at that part where the long card is, and present the pack to a person in such a manner that he will naturally draw that card. He is then to put it into any part of the pack, and shuffle the cards. You take the pack, and offer the same card in like manner to a second or third person; observing, however, that they do not stand near enough to see the card each other draws. You then draw several cards yourself, among which is the long card, and ask each of the parties if his card be among those cards, and he will naturally say Yes, as they have all drawn the same card. You then shuffle all the cards together, and cutting them at the long card, you hold it before the first person, so that the others may not see it, and tell him that is his card. You then put it again in the pack, and shuffling them a second time, you cut again at the same card, and hold it in like manner to the second person, and so of the rest (A).

If the first person should not draw the long card, each of the parties must draw different cards; when, cutting the pack at the long card, you put those they have drawn over it, and seeming to shuffle the cards indiscriminately, you cut them again at the long card, and show one of them his card. You then shuffle and cut again, in the same manner, and show another person his card, and so on: remembering, that the card drawn by the last person is the first next the long card; and so of the others.

This experiment may be performed without the long card, in the following manner. Let a person draw any card whatever, and replace it in the pack: you then make the pass, and bring that card to the top of the pack, and shuffle them without losing sight of that card. You then offer that card to a second person, that he may draw it, and put it in the middle of the pack. You make the pass and shuffle the cards a second time in the same manner, and offer the card to a third person, and so again to a fourth or fifth, as is more fully explained further on.

<sup>3</sup> The four confederated cards. 3. You let a person draw any four cards from the pack, and tell him to think on one of them. When he returns you the four cards, you dexterously place two of them under the pack and two on the top. Under those at the bottom you place four cards of any sort; and then, taking eight or ten from the bottom-cards, you spread them on the table, and ask the person if the card he fixed on be among them. If he say No, you are sure it is one of the two cards on the top. You then pass those two cards to the bottom, and drawing off the lowest of them, you ask him if that is not his card. If he again say No, you take that card up, and bid him draw his card from the bottom of the pack.

If the person say his card is among those you first drew from the bottom, you must dexterously take up the four cards that you put under them, and, placing those on the top, let the other two be the bottom-cards of the pack, which you are to draw in the manner before described.

(A) There is frequently exhibited another experiment, similar to this, which is by making a person draw the long card; then giving him the pack, you tell him to place his card where he pleases and shuffle them, and you will then name his card or cut the pack where it is. You may also tell him to put the pack in his pocket, and you will draw the card; which you may easily do by the touch.

4. AFTER a card has been drawn, you place it under the long card, and by shuffling them dexterously you bring it to top of the pack. Then lay, or throw, the pack on the ground, observing where the top-card lies. A handkerchief is then bound over your eyes, in such a manner however that you can see the ground, which may be easily done. A sword is then put into your hand, with which you touch several of the cards, seemingly in great doubt, but never losing sight of the top-card, in which at last you fix the point of the sword, and present it to him who drew it. Two or three cards may be discovered in the same manner, that is, by placing them under the long card, and then bringing them to the top of the pack.

5. You must have in the pack two cards of the same sort, suppose the king of spades. One of these is to be placed next the bottom-card, which may be the seven cards of hearts, or any other card. The other is to be placed at top. You then shuffle the cards, without displacing those three cards, and show a person that the bottom-card is the seven of hearts. Then drawing that card privately aside with your finger, which you have wetted for that purpose, you take the king of spades from the bottom, which the person supposes to be the seven of hearts, and lay it on the table, telling him to cover it with his hand. You then shuffle the cards again, without displacing the first and last card, and passing the other king of spades at the top to the bottom, you show it to another person. You then draw that privately away; and taking the bottom-card, which will then be the seven of hearts, you lay that on the table, and tell the second person, who believes it to be the king of spades, to cover it with his hand.

You then command the seven of hearts, which is supposed to be under the hand of the first person, to change into the king of spades; and the king of spades, which is supposed to be under the hand of the second person, to change into the seven of hearts; and when the two parties take their hands off, and turn up the cards, they will see, to their no small astonishment, after having so carefully observed the bottom-cards, that your commands are punctually obeyed.

6. TAKE a card, the same as your long card, and rolling it up very close, put it in an egg, by making a hole as small as possible, and which you are to fill up carefully with white wax. You then offer the long card to be drawn; and when it is replaced in the pack you shuffle the cards several times, giving the egg to the person who drew the card, and, while he is breaking it, you privately withdraw the long card, that it may appear, upon examining the cards, to have gone from the pack into the egg. This experiment may be rendered more surprising by having several eggs, in each of which is placed a card of the same sort, and then giving the person the liberty to choose which egg he thinks fit.

This deception may be still further diversified, by having, as most public performers have, a confederate, who is previously to know the egg in which the card is placed; for you may then break the other eggs, and show that the only one that contains a card is that

Divi  
by the  
word.

The  
natural  
card.

The  
comple  
transf  
tion.

that in which you directed it to be.

7. *Divide a piquet pack of cards into two parts by a long card. Let the first part contain a quint to a king in clubs and spades, the four eights, the ten of diamonds and ten of hearts; and let the other part contain the two quart majors in hearts and diamonds, the four sevens, and the four nines (8).*

Then shuffle the cards, but observe not to displace any of those cards of the last part which are under the long card. You then cut at that card, and leave the pack in two parts. Next, present the first of those parts to a person, and tell him to draw two or three cards, and place the remainder on the table. You present the second parcel in like manner to another. Then having dextrously placed the cards drawn by the first person in the second parcel, and those drawn by the second person in the first parcel, you shuffle the cards, observing to displace none but the upper cards. Then spreading the cards on the table, you name those that each person drew; which you will very easily do, by observing the cards that are changed in each parcel.

8. On the ace of spades fix, with soap, a heart, and on the ace of hearts, a spade, in such a manner that they will easily slip off.

Show these two aces to the company; then taking the ace of spades, you desire a person to put his foot upon it, and as you place it on the ground, draw away the spade. In like manner you place the seeming ace of hearts under the foot of another person. You then command the two cards to change their places; and that they obey your command, the two persons, on taking up their cards, will have ocular demonstration. A deception similar to this is sometimes practised with one card, suppose the ace of spades, over which a heart is placed slightly. After showing a person the card, you let him hold one end of it, and you hold the other, and while you amuse him with discourse, you slide off the heart. Then laying the card on the table, you bid him cover it with his hand. You then knock under the table, and command the heart to turn into the ace of spades. By deceptions like these, people of little experience and much conceit are frequently deprived of their money, and rendered ridiculous.

9. You must be prepared with two cards, like those represented by fig. 22. and with a common ace and a five of diamonds.

The five of diamonds and the two prepared cards are to be disposed as in fig. 23. and holding them in your hand, you say, "A certain Frenchman left 15,000 livres, which are represented by these three cards, to his three sons. The two youngest agreed to leave their 5000, each of them, in the hands of the elder, that he might improve it." While you are telling this story, you lay the 5 on the table, and put the ace in its place, and at the same time artfully change the position of the other two cards, that the three cards may appear as in fig. 24. You then resume your discourse, "The eldest brother, instead of improving the money, lost it all by gaming, except 3000 livres, as you here see." You then lay the ace on the table, and, taking up the 5, continue your story: "The eldest, sorry for having lost the money, went to

the East-Indies with these 3000, and brought back 15,000." You then show the cards in the same position as at first, in fig. 22.

To render this deception agreeable, it must be performed with dexterity, and should not be repeated, but the cards immediately put in the pocket; and you should have five common cards in your pocket, ready to show, if any one should desire to see them.

10. TAKE a parcel of cards, suppose 40, among which insert two long cards; let the first be, for example, the 15th, and the other the 26th from the top. Seem to shuffle the cards, and then cutting them at the first their weight long card, poise those you have cut off in your hand, and say, "there should be here 15 cards." Cut them again at the second long card, and say, "there are here only 11 cards." Then positing the remainder, you say, "here are 14 cards."

11. *Several different cards being shewn to different persons, that each of them may fix on one of those cards; to name that on which each person has fixed.—* There must be as many different cards shown to each person as there are persons to choose: therefore, suppose there are three persons, then to each of them you must show three cards; and telling the first person to retain one in his memory, you lay those three cards down, and show three others to the second person, and so to the third. You then take up the first person's cards, and lay them down one by one, separately, with their faces upward. You next place the second person's card over the first, and in like manner the third person's card over the second's; so that in each parcel there will be one card belonging to each person. You then ask each of them in which parcel his card is; and when you know that, you immediately know which card it is; for the first person's card will always be the first, the second person's the second, and the third person's the third, in that parcel where they each lay his card is.

This experiment may be performed with a single person, by letting him fix on three, four, or more cards. In this case you must show him as many parcels as he is to choose cards, and every parcel must consist of that number, out of which he must fix on one; and you then proceed as before, he telling you the parcel that contains each of his cards.

12. MAKE a ring large enough to go on the second or third finger (fig. 15.), in which let there be set a large transparent stone, to the bottom of which must be fixed a small piece of black silk, that may be either drawn aside or expanded by turning the stone round. Under the silk is to be the figure of a small card.

Then make a person draw the same sort of card as that at the bottom of the ring, and tell him to burn it in the candle. Having first shown him the ring, you take part of the burnt card, and reducing it to powder, you rub the stone with it, and at the same time turn it artfully about, so that the small card at bottom may come in view.

13. PROVIDE a mirror, either round, as A (fig. 18.), or oval, the frame of which must be at least as wide as the card in a card. The glass in the middle must be made to

23 R move

(8) The cards may be divided in any other manner that is easy to be remembered.

move in the two grooves CD and EF, and so much of the quicksilver must be scraped off, as is equal to the size of a common card. You will observe that the glass must likewise be wider than the distance between the frame, by at least the width of a card.

Then paste over the part where the quicksilver is rubbed off, a piece of pasteboard, on which is a card that must exactly fit the space, which must at first be placed behind the frame.

This mirror must be placed against a partition, through which is to go two strings, by which an assistant in the adjoining room can easily move the glass in the grooves, and consequently make the card appear or disappear at pleasure (c).

Matters being thus prepared, you contrive to make a person draw the same sort of card with that fixed to the mirror, and place it in the middle of the pack: you then make the pafs, and bring it to the bottom; you then direct the person to look for his card in the mirror, when the confederate behind the partition is to draw it slowly forward, and it will appear as if placed between the glass and the quicksilver. While the glass is drawing forward, you slide off the card from the bottom of the pack, and convey it away.

The card fixed to the mirror may easily be changed each time the experiment is performed. This experiment may also be made with a print that has a glass before it and a frame of sufficient width, by making a slit in the frame through which the card is to pass; but the effect will not be so striking as in the mirror.

14. PLACE a vase of wood or pasteboard AB (fig. 19.) on a bracket L, fixed to the partition M. Let the inside of this vase be divided into five parts, *c, d, e, f, g*; and let the divisions *c* and *d* be wide enough to admit a pack of cards, and those of *e, f, g*, one card only.

Fix a thread of silk at the point H, the other end of which passing down the division *d*, and over the pulley I, runs along the bracket L, and goes out behind the partition M.

Take three cards from a piquet pack, and place one of them in each of the divisions *e, f, g*, making the silk thread or line go under each of them. In the division *c*, put the pack of cards from which you have taken the three cards that are in the other divisions.

Then take another pack of cards, at the top of which are to be three cards of the same sort with those in the three small divisions; and, making the pafs, bring them to the middle of the pack, and let them be drawn by three different persons. Then give them all the cards to shuffle; after which place the pack in the division *d*, and tell the parties they shall see the three cards they drew come, at their command, separately out of the vase.

An assistant behind the partition then drawing the line with a gentle and equal motion, the three cards will gradually rise out of the vase. Then take the

cards out of the division *c*, and show that those three cards are gone from the pack.

The vase must be placed so high that the inside cannot be seen by the company. You may perform this experiment also without an assistant, by fixing a weight to the end of the silk line, which is to be placed on a support, and let down at pleasure by means of a spring in the partition.

15. LET a small perspective glass be made, that is wide enough, at the end where the object-glass is placed, to hold a table similar to the following.

<sup>15</sup>  
The dividing perspective glass.

1.131	10..132	19.133
2.231	11..232	20.233
3.331	12..332	21.333

4.121	13..122	22.123
5.221	14..222	23.223
6.321	15..322	24.323

7.111	16..112	25.113
8.211	17..212	26.213
9.311	18..312	27.313

Take a pack of cards that consists of 27 only, and giving them to a person, desire him to fix on any one, then shuffle them and give the pack to you. Place the 27 cards in three heaps, by laying down one alternately on each heap; but before you lay each card down, show it to the person, without seeing it yourself; and when the three heaps are finished, ask him at what number, from 1 to 27, he will have his card appear, and in which heap it then is? Then look at the heap through the glass, and if the first of the three numbers which stands against that number it is to appear at be 1, put that heap at top; if the number be 2, put it in the middle; and if it be 3, put it at bottom. Then divide the cards into three heaps, in the same manner, a second and third time, and his card will then be at the number he chose.

For example: Suppose he desire that his card shall be the 20th from the top, and the first time of making the heaps he say it is in the third heap: you then look at the table in the perspective, holding it at the same time over that heap, and you see that the first figure is 2; you therefore put that figure in the middle of the pack. The second and third times you in like manner put the heap in which he says it is, at the bottom, the number each time being 3. Then looking at the pack with your glass, as if to discover which the card was, you lay the cards down one by one, and the 20th card will be that he fixed on.

You may show the person his card in the same manner, without asking him at what number it shall appear, by fixing on any number yourself.

The foregoing experiments with the cards will be found sufficient to explain most others of a similar nature that have or may be made; the number of which is very great. To perform those we have described requires

(c) This experiment may be performed without an assistant, if a table be placed against the partition, and the string from the glass be made to pass through a leg of it, and communicate with a small trigger, which you may easily push down with your foot; and at the same time wiping the glass with your handkerchief, as if to make the card appear the more conspicuous. It may also be diversified, by having the figure of a head, suppose that of some absent friend, in the place of the card.

requires no great practice; the two principal points are, the making the pass in a dexterous manner, and a certain address by which you influence a person to draw the card you present. Those that are performed by the long card are in general the most easy, but they are confined to a pack of cards that is ready prepared; whereas those which depend on making the pass, may be performed with any pack that is offered.

SECT. II. *Experiments with Sympathetic Inks.*  
[See Sympathetic Ink †.]

EXPERIMENTS WITH CLASS I.

16. MAKE a book of 70 or 80 leaves; and in the cover at the end of it let there be a case, which opens next the binding, that it may not be perceived.

At the top of each right-hand page write any question you please; and at the beginning of the book let there be a table of all those questions, with the number of the page where each is contained. Then write with common ink, on separate papers, each about half the size of the pages in the book, the same questions that are in the book, and under each of them write, with the ink made of the impregnation of saturn, or the dissolution of bismuth, the answer.

Soak a double paper in the vivifying liquor made of quick-lime and orpiment, or the phlogiston of the liver of sulphur, and place it, just before you make the experiment, in the case that is in the cover of the book.

Then deliver some of the papers on which the questions were wrote to the company; and, after they have chosen such as they would have answered, they put them in those leaves where the same questions are contained, and, shutting the book for a few minutes, the sulphureous spirit with which the paper in the cover of the book is imbibed, will penetrate the leaves, and make the answers visible, which will be of a brown colour, and more or less deep in proportion to the time the book has been closed (p).

17. MAKE a box about four inches long, and three wide, as ABCD, and quite shallow. Let it shut with hinges and fasten with a hook; and let it have two bottoms, the lowest of wood, that draws out by a groove, and the uppermost of pasteboard. Between these two bottoms is to be placed a paper dipped in the vivifying liquor mentioned in the last experiment. Let there be also a board of the same size with the inside of the box, which being placed in it may press a paper against the pasteboard bottom.

Then take several pieces of paper, of the same size with the inside of the box, and draw on them the figures of men and women, in different attitudes and employments, as walking, riding, reading, writing, &c. These figures must be drawn with a new pen, or pencil, dipped in the impregnation of saturn.

Being thus provided, and having privately placed

the paper dipped in the vivifying liquor between the two bottoms, you tell a person you will show him what an absent friend of his is doing at the present hour. You then give him the paper adapted to the employment you intend, and tell him to write his friend's name at the bottom, that you may not change the paper. Then placing that paper next the pasteboard bottom, and putting the piece of wood over it, you shut the box. After amusing him with discourse for three or four minutes, you take out the paper, when he will see his friend in the employment you have assigned him.

18. LET a workman make a hand of wood, as in fig. 16. fixed at the end next the elbow to the piece E, the ends of which go through the screws CD and EF. The fore and middle fingers, and the thumb, are to be moveable at their joints. There must go a wire through the arm, that is fixed at one end to the fore-finger, and at the other to the piece E, round which it is to move: under the two joints of the two fingers are also placed two small springs, which are to raise it up.

To the fore-finger and thumb fix two small rings, through which a pen may be put, so as not to impede their motion. Under the arm, at the point I, place a small brass roller, which serves to sustain the arm.

The pedestal on which this hand is placed must be at least a foot long, if the hand be of the natural size, and about eight inches wide. This pedestal must be hollow, and at the part ST there must be an opening about three inches long and two inches wide; the whole pedestal may be covered with a thin stuff, by which the hole will be concealed. There is to be a valve, or sort of trap-door, on the inside of the pedestal, which is to fasten against the opening.

Over the hand and pedestal place a glass frame, as in the figure: cover the hand with fine leather of flesh colour, and decorate the arm with a ruffle and cuff, which will entirely conceal the machinery.

Then take a number of cards, and write on them different questions; and on the same number of papers write, with the impregnation of lead, the answers. Give the cards to any one, and let him choose a question; and you place the paper with the answer under the pen in the hand, letting him first see there is no writing on it (z). Now the pedestal being placed against a partition, the end F is to go through it. Therefore an assistant, upon a signal given, turns a handle fixed to F; and, as piece E turns round, the wires that move the fingers and thumb are alternately lengthened and shortened, by which their joints are kept in continual motion; and the screw at the same time turning gently from F towards G, gives the whole arm a motion which very much resembles that of nature (F).

The hand and pen serve here merely to assist the illusion: but if a bit of sponge, dipped in the vivifying liquor, be placed at the end of the pen, as it goes

23 R 2

18  
The artificial hand.

16  
book  
cite.

17  
mar.  
sup-  
fig. 17

† In that article, line 8. for *invisible* read *visible*.

(p). If a weight be placed upon the book, the effect will be the sooner produced. Or you may put the book in a box that will press it close down.

(r) The paper dipped in the vivifying liquor is to be previously placed against the opening in the table, and supported by the trap-door.

(s) This might be performed without an assistant, by means of a trigger placed in the leg of the table, and communicating with the handles, which the operator might thrust down with his foot. Where expence is not regarded, there may be a complete figure of a man in wood, or plaster of Paris, seated by the table.

over the writing on the paper, it will make it become gradually visible, and in this case the trap-door and and dipped paper may be omitted (c).

#### DECEPTION WITH CLASS II.

19. The writing against the wall.

19. TAKE several pieces of paper, of a size that you can put in any book that will go into your pocket, and write at the top of each of them a question, with common ink, and under it write the answer with the solution of gold or silver. Give any of these papers, closely wrapt up, to a person, and tell him to place it against the wall of his chamber, and keeping the door locked he will next day find the answer wrote on it.

As the gold ink will sometimes give a yellow cast to the paper, you may previously give a slight tincture of that kind to the papers you use for this purpose.

#### DECEPTION WITH CLASS III.

20. Magical vegetation.

20. ON different papers draw the figures of several leaves or flowers with one of the colourless juices mentioned: then take one of the corresponding leaves or flowers, and laying it on an iron plate, over a chafingdish of hot-coals, let it burn to ashes. Put these ashes into a sieve, in which there is some very fine steel-filings, and sift them over the paper on which the flower is drawn, when they will adhere to the glutinous liquor, and form an exact representation of the figure of the leaf or flower.

#### DECEPTIONS WITH CLASS IV.

21. The talisman, fig. 7.

21. MAKE a little triangular box, each side of which is to be about five inches, and let its inside be divided into three parts. The first part A, which makes the bottom of the box, is to be covered by the second part B, in form of a case, and let the top C exactly cover the part B, as is expressed in the figure and the profiles.

Upon the bottom of the box let there be a plate of copper, about one twentieth of an inch thick, on which let there be a number of hieroglyphic characters, contiguous to each other, and cut in different sorts of metal.

On the top of the cover place a knob O, that goes through it, and to which the copper triangle Q is to be fixed occasionally, in such manner as it may go into the case B. There must be a space of one quarter of an inch between the triangle Q, and the bottom of the case B; into which another plate of copper, of that thickness, may be placed.

The outside of this talisman may be decorated with uncommon figures or characters, to give it the appearance of greater mystery.

On several pieces of paper, of the same size with the inside of the talisman, write different questions, in common ink, and write the answers in those different sorts of sympathetic ink, that appear when heated, observing that each word of the answer is to be wrote in a different ink.

Having properly heated the triangle, and placed it under the cover, you introduce the talisman, and tell any one of the company to choose one of the papers on which the questions are wrote, and place it in the talisman, and he will immediately have an answer

wrote on that paper, the words of which will be of different colours, according to the different metals of which the talisman is composed. The paper being placed in the talisman, and the cover placed over it, the heat of the triangle will make the answer visible in a few moments. This experiment may be repeated if the triangle be made sufficiently hot; and two papers may be placed in the talisman at the same time.

This deception, when well executed, occasions a surprize that cannot be conceived by a mere description.

22. MAKE a wooden pedestal AB, about ten inches long, eight wide, and one deep: and at one end erect a box C, about ten inches high, eight broad, and two and a half deep.

The top of the pedestal must slide in a groove, on which inscribe a dial M, of six inches diameter, and which is to be divided into nineteen equal parts, in twelve of which write the names of the months, and mark the respective signs of the zodiack; and in the seven other divisions, which must be next the end B, write the days of the week, and mark the figures of the planets. Next the inner circle NO, make an opening into the box, of about one tenth of an inch. On the centre of the dial place an index that turns freely on its centre.

Within the pedestal place a pulley P, about four inches diameter, which is to turn on an axis that is directly under the centre of the dial; and on the upper part of that axis fix a bent index R, which comes out at the opening made by the inner circle (N), and passes over those seven divisions only on which are wrote the days of the week.

Within the box C, let there be two rollers S and T, as in the figure: let that of S contain a spring; and at the end of T let there be a pulley V, of three quarters of an inch diameter, round which goes a string or thread that passes under the small pulley X, and is fastened to that of P: so that when the last pulley makes about one-third of a turn, that of V may make three or four turns.

There must also be a scroll of paper, about two feet long, and each end of which must be pasted to one of the rollers. In the front of the box, between the two rollers, make an aperture D, about four inches long, and one inch and a half wide: to this opening let there be a little flap or slider, by which it may be closed at pleasure.

The apparatus being thus disposed, place the index R successively against each of the divisions marked with one of the planets; and as the paper is gradually wound up the roller, mark, against that part which is at the aperture D, the name of one of the following sibyls:

The Hellepontian	} sibyl.
Cumean	
Artemisian	
Phrygian	
Albunian	
Libyan.	

(c) You may also have a glass ink-stand, with some of the vivifying liquor, into which the pen may be dipped, and it will then appear to write with common ink. The spectators should not be permitted to come very near this machine, which may be applied to several other purposes.

(h) If the axis be made to pass through the top of the pedestal, this opening will not be necessary.

On

On each of the seven cards write a different question, and draw one of the seven planets. Next, take a memorandum-book that contains seven leaves, and on each of them write the name of one of the foregoing sibyls; in each of the leaves place several pieces of paper, and on each of them write, with the sympathetic ink that does not appear till the paper is heated, different answers to the same question.

Then give a person the seven cards on which the questions are wrote, and tell him to choose one of them privately, and conceal the rest, so that it cannot possibly be known which of them he has chosen.

Next, tell him to place the index that points to the month against that in which he was born (1), and to place the index of the planets against that which is on the card he has chosen, and which is to prefigure over the answer: you tell him to do this privately, that no one may see him, and after that to cover the dial with his handkerchief. Then let him open the door that is before the aperture in the box, and tell you the name of the sibyl there visible.

You then open the memorandum-book, and taking out the papers that are in the leaf where the name of the sibyl just mentioned is wrote, you desire him to choose any one of them he thinks proper. The talisman used in the last experiment being properly heated, is then to be introduced, when you direct the person to put the blank paper into it; and taking it out a few moments after, he will find the answer to his question.

To make this operation appear the more extraordinary, it will be proper to have a small press or cupboard, at the back of which there is a door that opens into an adjoining room, by which means an assistant having prepared the talisman may place it in the cupboard the moment before it is wanted. This contrivance will be useful on many other occasions.

22. PROVIDE a urn of wood or metal about six inches high, and two and a half diameter in the widest part, and of such figure in other respects as you think proper (see fig. 9.). Let there be a cylinder of copper C, (fig. 10.) of about one-eighth of an inch diameter, which is to fill a hole AB, made in the urn. The top of this cylinder is to be in the top of the urn, so that it may be easily taken out. To this urn there must be a cover D, which fits it exactly.

On a small square piece of paper draw the figure of a flower or leaf, with that sort of sympathetic ink whose colour most resembles it. You then present several sorts of flowers or leaves to a person, and desire him to choose any one of them. Then put that flower on a chafingdish of hot coals; and, taking the paper on which it is secretly drawn, you give it to the person to examine, and then put it in the urn, having previously heated the cylinder (K). Then taking some of the ashes of the burnt flower, you strew them over the paper, after which you take it out and shew the company the figure of that flower. While the flower is burning you may sprinkle some powder over it, suppose that of saltpetre; and by that, mixed with the ashes of the flower, the company may imagine the

effect is produced.

The press or cupboard mentioned in the preceding experiment will be here very convenient for heating the cylinder and placing it in the urn. A similar deception may be performed by putting the paper in a copper vessel, that may be placed on an iron plate over the chafingdish in which the flower is burnt. But this method has not so mysterious an appearance as the other, and in some persons may cause a suspicion that the effect is produced by heat.

24. To perform this experiment you must observe, <sup>24</sup> That there are several letters which may be changed into veritable others, without any appearance of the alteration; as, cards. the *a* into *d*, the *c* into *a*, *e*, *d*, *g*, *o*, or *q*, the *i* into *b*, *d*, or *h*, the *l* into *t*, the *e* into *a*, *d*, *g*, or *q*, the *v* into *y*, &c.

Take a parcel of cards, suppose 20, and on one of them write, with the ink of the fourth class, the word *law* (1), and on the other, with the same ink, the words *old woman*; then holding them to the fire, they will both become visible. Now you will observe, that by altering the *a* in the word *law* into *d*, and adding *o* before the *l*, and *oman* after the *w*, it becomes *old woman*. Therefore, you make those alterations with the invisible ink, and let it remain so. On the rest of the cards you write any words you think fit.

Present the cards in such a manner to two persons, that one of them shall draw the word *law*, and the other the words *old woman*. You then tell the person who drew the word *law*, that it shall disappear, and the words on the other card shall be wrote in its place; and that you may not change the cards, desire each of the parties to write his name on his card. Then putting the cards together, and holding them before the fire, as if to dry the names just wrote, the word *law* will presently change into *old woman*.

This experiment may be varied by fixing on a word that may be changed into three other words, and making four persons draw the cards on which those words are wrote; and it may be further diversified by choosing three such words, as that the first can be changed into the second, and the second into the third. You then tell him who drew the first word, that it shall be changed into that drawn by the second person; and him you tell, that his word shall be changed into that of the third person.

25. Write on several slips of paper different questions, and such as may be answered by the name of <sup>25</sup> The oral letters. some person; for example, Who is the merriest man in the company? Answer, Mr \* \* \*. To whom will Miss \* \* \* be married? Answer, To Mr \* \* \*. These questions are to be wrote in the sympathetic ink of this class, and exposed to the fire, and the answers wrote in the same ink, and left invisible. The papers are to be folded in form of letters, and in such manner that the part where the name is wrote shall be directly under the seal, and the heat of the wax will make it visible. Then give the letter to the person who requires the answer, and he will find it plainly wrote.

A deception similar to this may be made with a num-

(1) These months and the index are of no other use than to give the experiment an air of greater mystery.

(K) There are some sorts of sympathetic inks that require much more heat than others.

(L) These letters should not be joined.

number of blank cards, on each of which an ace of spades is drawn with the invisible ink; then let a person choose any one of them, and inclose it in a letter-case, prepared in such manner that the figure of the ace shall be directly under the seal, and on opening the letter it will be immediately visible.

#### DECEPTIONS with CLASS V.

<sup>26</sup> 26. HAVE a box that is divided into three parts, after the same manner as the talsiman in the 21<sup>st</sup> experiment, except that instead of being triangular, it must be of a long square (see fig. 14.) Divide its top B into two equal parts D and E, as in fig. 13. and to the part D adjust a plate of copper L, about one quarter of an inch thick, and under both the plate L and the opening E place a cloth. The upper part C must have a button by which it may be fixed on the cover B, so as to appear of one piece with it.

At the bottom of the box place a piece of cloth, or other stuff, on which you may stamp certain mysterious characters, and observe that the bottom of the cover must rest upon this cloth.

Then provide a slip of paper GH (fig. 12.) of the same size with the bottom of the box; and at each end of it write, with the green sympathetic ink, the name of a different card, and make some private mark by which you can tell at which end each name is wrote (N).

Take a parcel of cards, and offer those two of them whose names are wrote on the paper to the two persons, that they may draw them. You tell the parties to keep their cards to themselves, and you propose to make the names of those cards appear upon a slip of paper, which you put into the box. You then ask which name of the two cards shall appear first. The copper plate being previously heated and placed in the cover, you put it over that end of the paper on which is the name required, and it will presently appear. Then taking the paper out and showing the name wrote, you put it in again, turning the other end to the side of the box where the plate is, and it will in like manner become visible.

The first name may be made to disappear at the same time that the second appears, if the cloth at the end opposite to that where the plate is be made damp.

<sup>27</sup> 27. TAKE a print that represents winter, and trace over the proper parts of the trees, plants, and ground, with the green sympathetic ink; observing to make some parts deeper than others, according to their distance. When those parts are dry, paint the other objects with their natural colours. Then put the print in a frame with a glass, and cover the back of it with a paper that is pasted over its border only.

When this print is exposed to the heat of a moderate fire, or to the warm rays of the sun, all the grass and foliage will turn to a pleasing green; and if a yellow tint be given to some parts of the print, before the sympathetic ink be drawn over, this green will be of different shades; and the scene that a minute before

represented winter, will now be changed to spring. When this print is placed in the cold, winter will again appear, and will again be driven away by the warm rays of the sun. This alternate change of seasons may be repeated as often as you please; remembering, however, as was before observed, not to make the print at any time too hot, for then a faded autumn will for ever remain.

#### DECEPTIONS with CLASS VII.

<sup>28</sup> 28. PROVIDE a number of artificial flowers, such as roses, jonquils, pinks, or any other you find convenient. These flowers must be made of white thread or silk, and their leaves of parchment. Dip the roses in the red sympathetic ink, the jonquils in the yellow, the pinks in the violet, and their leaves in a solution of salt of tartar. When they are all dry, form them into small bouquets, which will all appear white, and may be used in this experiment, either the day they are dipped, or several days after.

You take one of these bouquets, and after showing the company that every part of it is white, you dip it in an infusion of any of the blue flowers mentioned under the article COLOUR-MAKING, n<sup>o</sup> 13. and, drawing it presently out, all the flowers and leaves will appear in their natural colours (N).

<sup>29</sup> 29. WRITE on a paper, with the violet liquor, as many letters or words as you please; and ask any person whether he will have that writing turn to yellow, green, or red. The transcolored writing.

Have a sponge with three sides that you can readily distinguish, and dip each of its sides in one of the three sympathetic inks. Draw the side of the sponge that corresponds to the colour the person has chose, over the writing once only; and it will directly change to the colour required (o).

#### Se<sup>c</sup>. III. Miscellaneous Performances.

<sup>30</sup> 30. A person having an even number of counters in one hand, and an odd number in the other, to tell in which hand the odd or even number is. Let the person multiply the number in his right-hand by an odd number, and the number in his left-hand by an even number, and tell you if the sum of the products added together be odd or even. If it be even, the even number is in the right hand; but if it be odd, the even number is in the left hand. To tell odd or evens.

#### Example.

1	Number in the right hand	18	In the left 7
	Multipliers	3	2
		54	14
		14	
	Their sum	68	

2 Num.

(M) That there may be no suspicion of the papers being prepared, you may cut it from a whole sheet, before the company, having previously wrote the names.

(N) The liquor should be put in a sort of jar with a narrow neck, that it may not be seen by the company; and you should draw the flowers gently out, that the liquor may drop if thin, and they may have time to acquire their colours.

(O) The sponge should be well cleaned immediately after the experiment.

<sup>27</sup> Winter changed into spring.

<sup>26</sup> The incense-prehensible writing.

2 Number in the right hand	} 7	In the left 78
Multipliers 3		
	21	36
	36	
Their sum	57	

31. To tell, by the dial of a watch, at what hour any person intends to rise. Let the person set the hand of the dial to any hour he pleases, and tell you what hour that is; and to the number of that hour you add, in your mind, 12. Then tell him to count privately the number of that amount upon the dial, beginning with the next hour to that on which he proposes to rise, and counting backwards, first reckoning the number of the hour at which he has placed the hand. An example will make this plain.

Suppose the hour at which he intends to rise be 8, and that he has placed the hand at 5. You add 12 to 5, and tell him to count 17 on the dial, first reckoning 5, the hour at which the index stands, and counting backwards from the hour at which he intends to rise; and the number 17 will necessarily end at 8, which shews that to be the hour he chose.

That the hour at which the counting ends must be that on which he proposed to rise, will be evident on a little reflection; for if he had began at that hour and counted 12, he would necessarily have come to it again; and calling the number 17, by adding 5 to it, only serves to disguise the matter, but can make no sort of difference in the counting.

32. If the number 11 be multiplied by any one of the nine digits, the two figures of the product will always be similar. As follows:

11	11	11	11	11	11	11	11	11	11
1	2	3	4	5	6	7	8	9	
11	22	33	44	55	66	77	88	99	

Place a parcel of counters on a table, and propose to any one to add, alternately, a certain number of those counters, till they amount to 100, but never to add more than 10 at a time. You tell him, moreover, that, if you flake first, he shall never make the even century, but you will. In order to which, you must first flake 1, and remembering the order of the above series, 11, 22, 33, &c. you constantly add, to what he flakes, as many as will make one more than the numbers of that series, that is, as will make 12, 23, 34, &c. till you come to 89, after which the other party cannot make the century himself, nor prevent you from making it.

If the other party has no knowledge of numbers, you may flake any other number first, under ten, provided you take care to secure some one of the last terms, as 56, 67, 78, &c.

This deception may be performed with other numbers; and in order to succeed, you must divide the number to be attained, by a number that has one digit more than what you can flake each time, and the remainder will be the number you must first flake. Observe, that, to be sure of success, there must be always a remainder. Suppose, for example, the number to be attained is 52, making use of a pack of cards

instead of counters, and that you are never to add more than 6; then divide 52 by the next number above 6, that is, by 7, and the remainder, which is 3, will be the number you must flake first; and whatever the other flakes, you must add as much to it as will make it equal to the number by which you divided, that is, 7. Therefore, if his first flake be 1, you must flake 6, &c. so that your second flake will make the heap 10, your third flake will make it 17, and so on, till you come to 45, when, as he cannot flake more than 6, you must make the number 52.

In this, as in the former case, if the other person has no knowledge of numbers, you may flake any number first under 7; or you may let him flake first, only taking care to secure either of the numbers 10, 17, 24, 31, &c. after which he cannot make 52, if you constantly add as many to his flake as will make it 7.

33. A person privately fixing on any number, to tell him that number. After the person has fixed on a number, bid him double it and add 4 to that sum, then multiply the whole by 5; to the product let him add 12, and multiply the amount by 10. From the sum of the whole let him deduct 320, and tell you the remainder; from which if you cut off the two last figures, the number that remains will be that fixed on.

Example.

Let the number chose be	-	-	7
Which doubled is	-	-	14
And 4 added to it, makes	-	-	18
Which multiplied by 5, gives	-	-	90
To which 12 being added, it is	-	-	102
That multiplied by 10, makes	-	-	1020
From which deducting 320, the remainder is	-	-	700
And by striking off the two ciphers, it becomes the original number	-	-	7

34. Three dice being thrown on a table, to tell the number of each of them, and the order in which they stand. Let the person who has thrown the dice double the number of that next his left hand, and add 5 to that sum; then multiply the amount by 5, and to the product add the number of the middle die; then let the whole be multiplied by 10, and to that product add the number of the third die. From the total let there be subtracted 250, and the figures of the number that remains will answer to the points of the three dice as they stand on the table.

Example.

Suppose the points of the three dice thrown on the table to be 4, 6, and 2,	
Then the double of the first die will be	8
To which add	5
	13
	5

That sum multiplied by 5 will be	65
To which add the number of the middle die	6
	71
	10

And multiply the sum by	710
To that product add the number of the third die	2

From

31  
to tell at  
that hour  
7 person  
intends to  
rise.

32  
the magi-  
century. ways be similar.

33  
To tell  
what num-  
ber a per-  
son private-  
ly fixes on.

34  
To tell the  
number of  
the points  
thrown up  
by 3 dice,  
without fac-  
ing them.

From the total 712  
 Subtract 250  
 And the three remaining figures 264  
 will answer to the numbers on the dice, and shew the order in which they stand.

35. *Some person in company having put a ring privately on one of his fingers; to name the person, the hand, the finger, and the joint, on which it is placed.*  
 Let a third person double the number of the order in which he stands who has the ring, and add 5 to that number; then multiply that sum by 5, and to the product add 10. Let him next add 1 to the last number if the ring be on the right hand, and 2 if on the left, and multiply the whole by 10: to this product he must add the number of the finger (counting the thumb as the first finger), and multiply the whole again by 10. Let him then add the number of the joint; and, lastly, to the whole join 35.

He is then to tell you the amount of the whole, from which you are to subtract 3535, and the remainder will consist of four figures, the first of which will express the rank in which the person stands, the second the hand, (the number 1 signifying the right hand, and 2 the left) the third number the finger, and the fourth the joint.

#### Example.

Suppose the person who stands the third in order has put the ring upon the second joint of the thumb of his left hand; then

The double of the rank of the third person is 6  
 To which add 5

Multiply the sum by 5

To which add 10  
 And the number of the left hand

Which being multiplied by 10

To which add the number of the thumb 1

And multiply again by 10

Then add the number of the joint 2  
 And lastly the number 35

From which deducting 3535

The remainder is 3212  
 Of which, as we have said, the 3 denotes the third person, the 2 the left hand, the 1 the thumb, and the last 2 the second joint.

36. *Cover the outside of a small memorandum-book with black paper, and in one of its inside covers make a flap, to open secretly, and observe there must be nothing over the flap but the black paper that covers the book.*

Mix foot with black or brown soap, with which rub the side of the black paper next the flap; then wipe it quite clean, so that a white paper pressed against it will not receive any mark.

Provide a black-lead pencil that will not mark without pressing hard on the paper. Have likewise a small box, about the size of the memorandum-book, and that opens on both sides, but on one of them by a private method. Give a person the pencil, and a slip of thin paper, on which he is to write what he thinks proper: you present him the memorandum-book at the same time, that he may not write on the bare board. You tell him to keep what he writes to himself, and direct him to burn it on an iron plate laid on a chafingdish of coals, and give you the ashes. You then go into another room to fetch your magic box above described, and take with you the memorandum-book.

Having previously placed a paper under the flap in the cover of the book, when he presses hard with the pencil, to write on the paper, every stroke, by means of the stuff rubbed on the black paper, will appear on that under the flap. You therefore take it out, and put it into one side of the box.

You then return to the other room, and taking a slip of blank paper, you put it into the other side of the box, strewing the ashes of the burnt paper over it. Then shaking the box for a few moments, and at the same time turning it dexterously over, you open the other side, and shew the person the paper you first put in, the writing on which he will readily acknowledge to be his.

37. *TAKE two guineas and two shillings, and grind part of them away, on one side only, so that they may be but of half the common thickness; and observe that they must be quite thin at the edge: then rivet a guinea and a shilling together. Lay one of these double pieces, with the shilling upwards, on the palm of your hand, at the bottom of your three first fingers; and lay the other piece, with the guinea upward, in like manner, in the other hand. Let the company take notice in which hand is the guinea, and in which the shilling. Then as you shut your hands, you naturally turn the pieces over; and when you open them again, the shilling and the guinea will appear to have changed their places.*

38. *PROVIDE a round tin box, of the size of a large snuff-box; and in this place eight other boxes, which will go easily into each other, and leave the least of them be of a size to hold a guinea. Each of these boxes should shut with a hinge; and to the least of them there must be a small lock, that is fastened with a spring, but cannot be opened without a key; and observe that all these boxes must shut so freely, that they may be all closed at once. Place these boxes in each other, with their tops open, in the drawer of the table on which you make your experiments; or, if you please, in your pocket, in such a manner that they cannot be displaced.*

Then ask a person to lend you a new guinea, and desire him to mark it, that it may not be changed. You take this piece in one hand, and in the other you have another of the same appearance; and putting your hand in the drawer you slip the piece that is marked into the least box, and, shutting them all at once, you take

35  
 To tell on  
 what finger,  
 joint, &c. a  
 ring has  
 been pri-  
 vately put.

37  
 The trans-  
 lative guinea.

38  
 The trans-  
 lative guinea.

36  
 The burnt  
 writing re-  
 stored.

take them out. Then showing the piece you have in your hand, and which the company suppose to be the same that was marked, you pretend to make it pass through the box, and dexterously convey it away.

You then present the box, for the spectators do not yet know there are more than one, to any person in company; who, when he opens it, finds another, and another, till he comes to the last, but that he cannot open without the key, which you then give him, and retiring to a distant part of the room, you tell him to take out the guinea himself, and see if it be that he marked.

This deception may be made more surprising, by putting the key into the snuff-box of one of the company; which you may do by asking him for a pinch of his snuff, and at the same time conceal the key, which must be very small, among the snuff: and when the person who is to open the box asks for the key, you tell him that one of the company has it in his snuff-box. This part of the deception may likewise be performed by means of a confederate.

<sup>39</sup> <sup>here suffi-</sup> 39. Provide a small tin mortar, that is double, as A, <sup>red flower</sup> (fig. 8.) whose bottom B turns round on an axis, by means of a spring which communicates with the piece C. There must be a hollow space under the false bottom. To the under-side of the bottom fasten, by a thread of fine silk, a flower, with its stalk and leaves.

Then take a flower that exactly resembles the other, and plucking it from the stalk, and all the leaves from each other, put them into the mortar, and pound them with a small pestle; after which you show the mortar to the company, that they may see the parts are all bruised.

Then taking the mortar up in your hands, you hold it over the flame of a lamp or candle, by whose warmth the flower is supposed to be reformed; and at the same time pressing the piece at C, the bottom will turn round, the bruised parts descend into the space under the bottom, and the whole flower will be at top: you then put your hand into the mortar, and easily breaking the silk thread, which may be very short as well as fine, you take the flower out and present it to the company.

There is an experiment similar to this, in which a live bird is concealed at the bottom of the mortar, and one that is dead is pounded in it; after which, by the motion of the bottom, the live bird is set at liberty. But surely the pounding a bird in a mortar, though it be dead, must produce, in persons of any delicacy, more disgust than entertainment.

<sup>40</sup> <sup>the lumi-</sup> 40. Procure a tin box ABCD, (fig. 1.) about eight <sup>ous oracle</sup> inches high, four wide, and two deep, and let it be fixed on the wooden stand E. On two of the insides let there be a groove FG; and in the front an opening I, three inches wide and one high.

At the back of the box let there be a little tin door, that opens outward, by which two wax-candles M may be put in. Let the top of the box have a cover of the same metal, in which there are several holes, and which may be taken off at pleasure.

VOL. VI.

Provide a double glass OP, (fig. 2.) constructed in the same manner as that in the last experiment. On one of its sides you are to paste a black paper, the length of which is to be divided into three parts, and the breadth into fifteen: in every two of these fifteen divisions you cut out letters, which will make in the whole three answers, to three questions that may be proposed. On the other side of the glass paste a very thin paper, and to the top fasten a small cord, by which they may be made to rise or descend in the groove FG.

Then take a slip of pasteboard RS, (fig. 3.) one inch and a half wide and three inches long, which is to be divided into fifteen equal parts similar to those of the paper OP, and cut out spaces, as in the figure, so that this paper, sliding horizontally before OP, will either cover or conceal the letters cut in that.

This pasteboard is to slide between two brass wires, and is to be fastened to one side of the box, by a string that communicates with a small brass spring; and to the other side, by a string fastened to the box by a small piece of wax, so situated that the string may be easily set at liberty by the heat of the candles placed in the box.

Take a parcel of cards, and write on them different questions, three of which are to correspond with the answers on the glass. Shuffle these cards, and let a person draw any one of the three questions. Then by raising the glass you bring the answer against the hole in the front in the box. You next place the candles in the box, the heat of which will melt the wax that holds the paper RS, which being then drawn by the spring the answer will be visible, and in proportion as the composition between the glasses becomes diluted by the increase of the heat, the letters will become more strongly illuminated.

The letters cut in the paper may be made to answer several different questions, as has been explained in other experiments; and the whole parcel of cards may consist of questions that may be answered by one or other of the three divisions in the paper.

30. MAKE a tin box ABCD, (fig. 4.) with a cover M, that takes off. Let this box be supported by <sup>41</sup> <sup>A flower</sup> <sup>produced</sup> a pedestal FGHI, of the same metal, and on which <sup>from its</sup> <sup>afflux.</sup> there is a little door L. In the front of this box is to be a glass, O.

In a groove, at a small distance from O, place a double glass of the same sort with that in the last experiment. Between the front and back glasses place a small upright tin tube supported by the cross-piece R. Let there be also a small chafing-dish placed in the pedestal FGHI. The box is to be open behind. You privately place a flower (a) in the tin tube R; and presenting one that resembles it to any person (\*), desire him to burn it on the coals in the chafing-dish.

You then strew some powder over the coals, which may be supposed to aid the ashes in producing the flower; and then put the chafing-dish in the pedestal, under the box. As the heat by degrees melts the composition between the glasses, the flower will gradually

23 S

ap-

(Q) This flower must not be placed so near the front glass, as to make it in the least degree visible.

(R) You may present several flowers, and let the person choose any one of them. In this case, while he is burning the flower, you fetch the box from another apartment, and at the same time put in a corresponding flower, which will make the experiment still more surprising.

appear; but when the chafingdish is taken away, and the power of the ashes is supposed to be removed, the flower soon disappears.

For entertaining experiments, illusions, &c. of a

philosophical nature, see ACOUSTICS, CATOPTICS, CHROMATICS, DIOPTRICS, ELECTRICITY, HYDROSTATICS, MAGNETISM, MECHANICS, PYROTECHNICS, &c.

## L E G

Leger,  
Leghorn.

**LEGER-LINE**, in music, one added to the staff of five lines, when the ascending or descending notes run very high or low: there are sometimes many of these lines both above and below the staff, to the number of four or five.

**LEGHORN**<sup>17</sup>, anciently called *Liburnus Portus*, but by the modern Italians *Livorno*, a handsome town of Italy, in the duchy of Tuscany, and a free port, about 30 miles south-west from Florence, in the territory of Pisa. The only defect of the harbour is its being too shallow for large ships. Cosmo I. had this town in exchange for Sarzana, from the Genoese; and it is the only sea-port in the duchy. It was then but a mean, unhealthy place; but is now very handsome, and well-built, with broad, straight, parallel streets. It is also well fortified; but wants good water, which must be brought from Pisa. The port, consisting of two havens, one for the duke's galleys, and the other for merchant ships, is surrounded with a double mole, above a mile and a half in length, and defended, together with the town, by a good citadel and 12 forts. Roman Catholics, Jews, Greeks, Armenians, Mahometans, and even the English factory, are indulged in the public exercise of their religion; but other Protestants must be satisfied with the private. The trade carried on here is very great, and most of it passes thro' the hands of the Jews. Though only two piasrés, or scudi, are paid for every bale, great or small, imported or exported, yet the duties on all provisions and commodities brought from the continent to the town are very heavy. The number of the inhabitants is said to be about 40,000; and one half of these are Jews, who live in a particular quarter, but without any mark of distinction, and have a fine synagogue. The walks on the ramparts are very agreeable. There is good anchorage in the road; but ships riding there are much exposed to the weather and the Barbary corsairs. The number of English families in Leghorn are about 36; they are much favoured by the government, and carry on a good trade. The power of the inquisition is limited to ecclesiastical matters, and Roman Catholics. There are a great many Turkish slaves here, brought in by the duke's galleys, who are often sent out on a cruise against the corsairs of Barbary. The light-house stands on a rock in the sea; near which is the Lazaretto, where quarantine is performed. Another source, from which the duke draws a great revenue, is the monopoly of brandy, tobacco, and salt; but that, with the heavy duties, makes provisions dear. The Turks who are not slaves, live in a particular quarter, near that of the Jews. The common prostitutes also have a particular place assigned them, out of which they must not be seen, without leave from the commissary. The number of the rowers in the galleys, whether Turkish slaves, criminals, or volunteers, are about 2000. In the area before the darsena, or inner harbour, is a fine statue of duke Ferdinand, with four Turkish slaves, in bronze, chained to the pedestal. The ducal palace is one of the finest structures in the town,

## L E I

and the ordinary residence of the governor. Leghorn is the see of a bishop, and has a noble cathedral; but the other churches are not remarkable. E. Long. 11. o. N. Lat. 43. 30.

**LEGION**, in Roman antiquity, a body of foot which consisted of ten cohorts. The word comes from the Latin *legere*, to choose; because, when the legions were raised, they made choice of such of their youth as were most proper to bear arms.

The exact number contained in a legion was fixed by Romulus at 3000; though Plutarch assures us, that, after the reception of the Sabines into Rome, he increased it to 600. The common number afterwards in the first times of the free state was 4000; but in the war with Hannibal it rose to 5000; and after that it is probable that it sunk again to 4000, or 4200, which was the number in the time of Polybius.

They borrowed their names from the order in which they were raised, as *prima, secunda, tertia*; but because it usually happened that there were several *primæ, secundæ, &c.* in several places, they, on that account, took a sort of surname besides, either from the emperors who first constituted them, as *Augusta, Claudiana, Galbiana*; or from the provinces which had been conquered chiefly by their valour, as *Parthica, Scythica, Gallica, &c.* or from the names of the particular deities for whom their commanders had an especial honour, as *Minervia* and *Apollinaris*; or from the region where they had their quarters, as *Cretensis, Cyrenaica, Britannica, &c.* or sometimes upon account of lesser accidents, as *Ajutrix, Martia, Fulminatrix, Rapax, &c.*

**LEGISLATOR**, a lawgiver, or person who establishes the policy and laws of a state. Such was Moses, among the Jews; Lycurgus, among the Lacedæmonians, &c.

**LEGITIMATION**, an act whereby illegitimate children are rendered legitimate. See BASTARD.

**LEGITIME**, in Scots law, that share of the moveable effects belonging to a husband and wife, which upon the husband's death falls to the children.

**LEGUMEN**, a rod; a species of seed-vessel which has two valves or external openings inclosing a number of seeds that are fastened along one suture only. In this last circumstance the seed-vessel in question differs from that termed by botanists *siliqua*, in which the inclosed seeds are fastened alternately to both the futures or joinings of the pod.

The seed-vessel of all the pea-bloom or butterfly-shaped flowers, the *diadelphæ* of Linneus, is of this pod-kind. Such, for instance, is the seed-vessel of the pea, vetch, lupine, and broom.

**LEGUMINOUS**, an appellation given to all plants whose fruit is a legumen.

**LEIBNITZ** (Godefray-William de), an eminent mathematician and philosopher, was born at Leipzig in Saxony in 1646. At the age of 15 years, he applied himself to mathematics at Leipzig and Jena; and in 1663, maintained a thesis de *Principiis Individuationis*.

The

Legion  
Liebnitz.

*Schütz.* The year following he was admitted master of arts. He read with great attention the Greek philosophers; and endeavoured to reconcile Plato with Aristotle, as he afterwards did Aristotle with Des Cartes. But the study of the law was his principal view; in which faculty he was admitted bachelor in 1665. The year following he would have taken the degree of doctor; but was refused it on pretence that he was too young, though in reality because he had raised himself several enemies by rejecting the principles of Aristotle and the Schoolmen. Upon this he went to Altorf, where he maintained a thesis *de Cassibus Perplexis*, with such applause, that he had the degree of doctor conferred on him. He might have settled to great advantage at Paris; but as it would have been necessary to have embraced the Roman Catholic religion, he refused all offers. In 1673, he went to England; where he became acquainted with Mr Oldenburgh, secretary of the royal society, and Mr John Collins, fellow of that society. In 1676, he returned to England, and thence went into Holland, in order to proceed to Hanover, where he proposed to settle. Upon his arrival there, he applied himself to enrich the duke's library with the best books of all kinds. The duke dying in 1679, his successor Ernest Augustus, then bishop of Osnaburgh, shewed our author the same favour as his predecessor had done, and ordered him to write the history of the house of Brunswick. He undertook it, and travelled over Germany and Italy in order to collect materials. The elector of Brandenburg, afterward king of Prussia, founded an academy at Berlin by his advice; and he was appointed perpetual president, though his affairs would not permit him to reside constantly at Berlin. He projected an academy of the same kind at Dresden; and this design would have been executed, if it had not been prevented by the confusions in Poland. He was engaged likewise in a scheme for a universal language. His writings had long before made him famous over all Europe. Beside the office of privy-counsellor of justice, which the elector of Hanover had given him, the emperor appointed him in 1711 aulic counsellor; and the czar made him privy-counsellor of justice, with a pension of 7000 ducats. He undertook at the same time the establishment of an academy of science at Vienna; but the plague prevented the execution of it. However, the emperor, as a mark of his favour, settled a pension on him of 2000 florins, and promised him another of 4000 if he would come and reside at Vienna. He would have complied with this offer, but he was prevented by death in 1716. His memory was so strong, that in order to fix any thing in it, he had no more to do but to write it once; and he could even in his old age repeat Virgil exactly. He professed the Lutheran religion, but never went to sermon; and upon his death-bed, his coachman, who was his favourite servant, desiring him to send for a minister, he refused, saying, *he had no need of one.* Mr Locke and Mr Molyneux plainly seem to think that he was not so great a man as he had the reputation of being; and, in truth, many of his metaphysical notions are quite unintelligible. Foreigners did for some time ascribe to him the honour of an invention, of which he received the first hints from Sir Isaac Newton's letters, who had discovered the method of fluxions in 1664 and 1665.

But it would be tedious to give the reader a detail of Leicester the dispute concerning the right to that invention.

LEICESTER, the capital of a county of the same name in England, upon the river Leire, now called *Soare*. From its situation on the Fosse-way, and the many coins and antiquities discovered here, it seems probable that it was a place of some note in the time of the Romans. In the time of the Saxons it was a bishop's see, and afterwards repaired and fortified by Edelfrida, that it became, according to Matthew Paris, a most wealthy place, having 32 parish-churches; but in Henry the Second's reign it was in a manner quite ruined, for joining in rebellion against him with Robert earl of Leicester. In the reign of Edward III. however, it began to recover, by the favour of his son Henry Plantagenet, duke and earl of Lancaster, who founded and endowed a collegiate church and hospital here. It is a borough and corporation, governed by a mayor, recorder, steward, bailiff, 24 aldermen, 48 common-council men, a solicitor, a town-clerk, and two chamberlains. It had its first charter from king John. The freemen are exempt from paying toll in all the fairs and markets of England. It has three hospitals; that mentioned above, built by Henry Plantagenet duke of Lancaster, and capable of supporting 100 aged people decently; another erected and endowed in the reign of Henry VIII. for 12 poor lazars; and another for six poor widows. The castle was a prodigious large building, where the duke of Lancaster kept his court. The hall and kitchen still remain entire, of which the former is very spacious and lofty; and in the tower over one of the gate-ways is kept the magazine for the county militia. There was a famous monastery here, anciently called, from its situation in the meadows, *St Mary de Pratris* or *Prez*. In these meadows is now the course for the horse-race. It is said that Richard III. who was killed at the battle of Bosworth, lies interred in St Margaret's church. The chief business of Leicester is the stocking-trade, which hath produced in general to the amount of 60,000 l. a year. In a parliament held here in the reign of Henry V. the first law for the burning of heretics was made, levelled against the followers of Wickliffe, who was rector of Lutterworth in this county, and where his pulpit is said still to remain. The town suffered greatly in the civil wars, by two sieges upon the back of one another. It has given the title of earl to several noble families, and last to Thomas Coke, lord Lovel, created earl of Leicester in 1744. It has a market every Saturday. W. Lon. 1. 5. N. Lat. 52. 40.

LEICESTERSHIRE, an inland county of England, in form almost circular. It has Nottinghamshire and Derbyshire to the north; Rutlandshire and Lincolnshire on the east; Warwickshire on the west, from which it is parted by the Roman military way called *Watling-street*; and by Northamptonshire on the south. It is 33 miles long, 28 broad, and 100 in circumference; containing 560,000 acres, 112,200 inhabitants, 200 parishes, and 13 market-towns. As it lies at a great distance from the sea, and is free from bogs and marshes, the air is sweet and wholesome. It is a champaign country in general, and abundantly fertile in corn and grass, being watered by several rivers, as the Soare, or Sore, which passes through the middle

Leighton. middle of it, and abounds in excellent salmon and other fish; the Wreke, Trent, Eye, Senfe, Auker, and Aven. These rivers being mostly navigable, greatly facilitate the trade of the county. In some parts there is a great scarcity of fuel, both wood and coal; but in the more hilly parts there is plenty of both, together with great flocks of sheep. Besides wheat, barley, oats, and pease, it produces the best beans in England. They grow so tall and luxuriant in some places, particularly about Barton in the Beans, that they look, towards the harvest-time, like a forest: and the inhabitants eat them not only when they are green, as in other places, but all the year round; for which reason their neighbours nickname them *bean-bellies*. They have plenty of very good wool, of which they not only make great quantities of stockings, but send a great quantity unmanufactured into other parts of England. They make great profit of their corn and pulle; and likewise breed great numbers of coach and dray horses, most of the gentlemen being graziers; and it is not uncommon to rent grass-farms from 500*l.* to 2000*l.* a-year. It is in the midland circuit, and diocese of Lincoln; and sends four members to parliament, two for Leicester, and two for the county.

LEIGHTON (Robert), archbishop of Glasgow. During Cromwell's usurpation, he was minister of a church near Edinburgh, and distinguished himself by his charity, and his aversion to religious and political disputes. The ministers were then called over yearly in the synod, and were commonly asked, Whether they had preached to the times? "For God's sake," (answered Leighton), when all my brethren preach to the times, suffer me to preach about eternity." His moderation, however, giving offence, he retired to a life of privacy. But soon after, he was called, by the unanimous voice of the magistrates, to preside over the college of Edinburgh; where, during 10 years, he displayed all the talents of a prudent, wise, and learned governor. Soon after the Restoration, when the ill-judged affair of introducing episcopacy into Scotland was resolved on, Leighton was consecrated bishop of Dunblane, and immediately gave an instance of his moderation: for when Sharpe and the other bishops intended to enter Edinburgh in a pompous manner, Leighton remonstrated against it; but finding that what he said had no weight, he left them, and went to Edinburgh alone. Leighton, in his own diocese, set such a remarkable example of moderation, that he was revered even by the most rigid of the opposite party. He went about, preaching without any appearance of pomp; gave all he had to the poor; and removed none of the ministers, however exceptionable he might think their political principles. But finding that none of the other bishops would be induced to join, as he thought, properly in the work, he went to the king, and resigned his bishopric, telling him he would not have a hand in such oppressive measures. Soon after, the king and council, partly induced by this good bishop's remonstrances, and partly by their own observations, resolved to carry on the cause of episcopacy in Scotland on a different plan; and with this view, Leighton was persuaded to accept of the archbishopric of Glasgow, on which he made one effort more; but finding it not in his power to stem the violence of the

times, he resigned his archbishopric, and retired into Suffolk, where he devoted himself to acts of piety. He died in the year 1684. He was of a most amiable disposition, strict in his life, polite, cheerful, engaging in his manners, and profoundly learned. He left many sermons and useful tracts, which are greatly esteemed.

LEINSTER, or LEMPSTER, a province of Ireland, called in Latin *Lagenia*, bounded by Ulster on the north, by Connaught and Munster on the west and south-west, and by the sea on the south and east. The Shannon separates it from Connaught, and the Sure from a part of Munster. Its length from north to south amounts to about 112 miles; its breadth from east to west 70; and its circumference, including the windings and turnings, to 360 miles. It contains 12 counties, viz. Louth, East-Meath, West-Meath, Longford, Dublin, Kildare, King's-county, Queen's-county, Wicklow, Catherlogh, Kilkenny, and Wexford; 90 baronies, one archbishopric, three bishoprics, 926 parishes, 47 parliamentary boroughs, and 63 market-towns and places of trade. Leinster in general is very well cultivated, enjoys a good air and soil, and abounds in corn, cattle, fish, and fowl. Its principal rivers are the Boyne, Barrow, Liffey, Nuer, Slane, or Urrin, and the May; of which the first is famous for the victory obtained on its banks by king William over king James, and gives title of *viscount* to a family of the name of *Hamilton*. The bog of Allen, the largest in the kingdom, extends almost across the whole province from east to west, the turf of which is universally esteemed the best in Ireland. This province, formerly governed by petty kings of its own, is now the most populous in the kingdom, containing the capital and seat of government. The inhabitants are also the most polite, and, in general, as zealous Protestants as any in the British dominions. Leinster gives the title of *duke* to the family of Fitzgerald, formerly earls of Kildare.

LEIPSIC, a large, strong, and populous town of Misnia in Germany, with a castle, and a famous university. It is neat, and regularly built, and the streets are lighted in the night; it carries on a great trade, and has a right to stop and sell the merchandizes designed to pass through it, and the country for 75 miles round has the same privilege. There are three great fairs every year; at the beginning of the year, Easter, and Michaelmas, which last 15 days each. There are six handsome colleges belonging to the university, besides the private colleges. The town-house makes an indifferent appearance, but the exchange is a fine structure. The town was taken by the king of Prussia in the late war, but given up by the peace in 1763. It is seated in a plain between the rivers Saale and Muld, near the confluence of the Playffe, the Elster, and the Barde. E. Long. 12. 55. N. Lat. 51. 19.

LEITH, (anciently called *Inverleith*), the port of Edinburgh, is seated on the banks of the Forth, about a mile from the capital. It is divided into two parts, called *North* and *South Leith*. The former is a part of the barony of the Canongate; and is subject to the baron-bailie of that district, and to the magistrates of Edinburgh. The communication between North and South Leith is by a stone-bridge of three arches, which appears to have been founded by Robert Balclyne,

Leinster  
Leith.

Leith.

lentyne, abbot of Holyrood-house, in 1493. The harbour, however, is what gives the importance to Leith, and indeed to Edinburgh also. It is formed by the conflux of the rivulet called the *Water of Leith* with the Frith of Forth. The depth of water, at neap-tides, is about nine feet; but in high spring-tides, it is about 16 feet. In the beginning of the present century, the town-council of Edinburgh improved the harbour at an enormous expence, by extending a stone-pier a considerable way into the sea. In 1753, an act was passed for enlarging and deepening the harbour of Leith; but as no adequate means were proposed by the statute for defraying the expence, nothing was done in consequence. A plan was soon afterwards formed for enlarging the harbour upon a still larger plan; and, to carry this expensive project into execution, a bill was framed by which an additional duty from 1d. to 6d. a ton was to be laid upon all shipping in the harbour. But the scheme was dropped, in consequence of a vigorous opposition. In 1777, the town of Edinburgh considerably improved the harbour, by erecting an additional stone-quay towards its west side. Upwards of 100 ships can lie conveniently in this port. It is accommodated with wet and dry docks, and other conveniences for ship-building, which is there carried on to some extent, as vessels come to Leith to be repaired from all parts of Scotland.

The harbour of Leith was granted to the community of Edinburgh by king Robert, in 1329; but the banks of the harbour belonged to Logan of Restalrig, a turbulent and ambitious baron, from whom the citizens were under the necessity of purchasing the bank or waste piece of ground between the houses and the rivulet abovementioned, for the purposes of wharfs, as well as for erecting shops and granaries, neither of which they could do before. As the situation of Leith, however, is much more convenient for trade than that of Edinburgh, two miles distant from the harbour, the inhabitants of the metropolis have fallen upon various methods of restraining the trade of Leith. They first purchased, from Logan of Restalrig, an exclusive privilege of carrying on every species of traffic in the town of Leith; of keeping warehouses and inns for the entertainment of strangers in that place; and in 1483, the town-council of Edinburgh prohibited, under severe penalties, the citizens of Edinburgh from taking into partnership any inhabitant of Leith. To free themselves from this oppression, the people of Leith purchased the superiority of their town from Logan of Restalrig for 3000l. Scots, and it was erected into a burgh of barony by the queen-regent, Mary of Lorraine, who promised to erect it into a royal burgh. She died, however, before this was accomplished; and upon her death, Francis and Mary, in violation of the private rights of the people of Leith, re-fold the superiority to the town of Edinburgh, to whom it has since been confirmed by grants from successive sovereigns.

On the breaking out of the disturbances at the Reformation, the queen-regent caused the whole town to be fortified, that the French troops might have a more ready inlet into the kingdom. It was accordingly surrounded with a wall, having eight bastions: but this wall went no farther than the street now called *Bernard's nook*, because at that time the sea came

up the length of that street; and even as late as 1623, a house situated exactly where the weigh-house is at present, is described as bounded on the east by the "land of the sea-shore." All that space, therefore, on which the row of houses nearest the harbour of Leith now stands, has been gained since that time from the sea.

In the time of Charles I. a fortification was erected at Leith by the Covenanters. Cromwell built a strong fort at the place still called the *citadel* in North-Leith; but it was pulled down on the restoration of Charles II. by order of government. A gate with portcullises are the present remains of that fortification.—A palace also appears to have formerly stood here, situated at the north-east boundaries of the former town, on the spot where the present weigh-house stands. It was destroyed by the English in the time of Henry VIII. The remains of this building, called the *king's work*, with a garden, and piece of waste land that surrounded it, was erected into a barony by James VI. and bestowed upon Bernard Lindsay of Lochill, groom of the chamber to that prince. He is said to have fully repaired, and appropriated it to the recreations of the court; but it soon fell from its dignity, and became subservient to much more ignoble purposes. The tennis-court was converted into a weigh-house; and the street which bounds it still bears the name of the founder, from whom it is called *Bernard's nook*.

As Leith lay within the parish of Restalrig, the church of Restalrig was of consequence the place of worship for the inhabitants of Leith; but in 1650 the assembly ordered that church to be pulled down as a monument of idolatry, so that Leith wanted a parish-church for upwards of 50 years. During that period they resorted for worship, to a large and beautiful chapel already built, and dedicated to St Mary, which is now called *South-Leith church*; and in 1609 this chapel was by authority of parliament declared to be the parish-church of the district, so that Restalrig is now in the parish of South-Leith, as the latter was formerly in that of Restalrig. In 1772, a chapel of Ease was erected by the inhabitants, as the parish-church was insufficient to contain the number of hearers. Its dimensions are 72 feet by 52 within the walls, and it can accommodate 1500 persons. There is also an episcopal and several dissenting congregations in Leith. North-Leith is a parish by itself, and the church is situated at the south-end of the bridge.

Though a very great trade is carried on between Leith and many foreign ports, yet the articles of export and import fluctuate so much, that no quantity can be settled upon as an average, at least without having a table of exports and imports for such a number of years as is perhaps impossible to be obtained. The following is an account of the number of ships, &c. employed in the foreign and coasting trades, for one year ending January 5th 1778, taken from Mr Arnot's History of Edinburgh.

#### Foreign Trade,

Ships	Tons	Men
52	6900	418

#### Coasting and Fishing Trade,

Ships	Tons	Men
44	3346	281

N. B

*N. B.* It is to be observed, that besides the vessels belonging to Leith, there are employed in the trade, ships belonging to other ports on the Frith; and to the north of England, to the amount of about one fourth of the tonnage of the Leith vessels. Ships in the London trade make, at an average, seven voyages up, and as many down, every two years.

The following is an account of the articles of import and export to and from the port of Leith, taken from the same work.

## IMPORTS.

*From Denmark.* Considerable quantities of oats, pease, and barley, when the port is open: small quantities of butter, cheese, old iron, and scull iron.

*From Norway.* Deals, about 15,000 annually; battens, spars, handspikes, oak-spokes for cart-wheels; harrow-bills, hasel-cuts, fir-timber, middle balks, small balks, pailing boards, wood-hoops for coopers; oak-knees for ships; tar, in 1777 3000 barrels; oak-timber, bar-iron, oars, tree-nails, flock-fish, barley, sieve-rims.

*From Sweden.* Bar-iron, about 400 tons annually; deals, about 10,000 annually; battens; tar, in 1777 about 600 barrels; barrel-staves, handspikes, spars, pailing boards, fir-timber, oats, barley.

*From Russia.* Bar-iron, about 600 tons annually; deals, in 1777, 35,000; battens, in 1777, 12,000; fir-timber; flax, about 250 tons annually; hemp, cordelia; tallow, in 1777, 200 tons; hogs-bristles, mats, wheat, oats, barley, ships masts, spars, sieve-rims, feather-beds, oak-timber, a considerable quantity of linens of different kinds; flax-feed, about 1000 barrels annually; cordage, elk's hair, old iron, furs, knees of oak for ships; handspikes, neats-tongues, ifinglass, indigo, rosin; tar, in 1777, 1100 barrels; tallow-candles, hard-soap, pearl-ashes, sail-cloth, pailing boards.

*From Prussia.* Fir-timber, in 1777, 1200 loads; deals, battens, pipe and barrel staves; wheat, oats, barley, pease, pearl-ashes, flax, hemp, bar-iron, scull-iron, old iron, ships masts, linen-yarn, weed-ashes, pot-ashes, ox and cow-hides, calves-skins.

*From Poland.* Weed-ashes, pearl-ashes, and pot-ashes; oak-plank, in 1777, 115 loads; oak-timber, clap-boards, barrel and kilderkin staves; pipe and hoghead staves; salt-petre, honey, spruce-beer, hogs-bristles, wheat, deals, feathers for beds, tree-nails, linens, linen-yarn, linen-rags, ox and cow-hides, calves-skins, beech and elm timber, oats, barley, pease.

*From Germany.* Oak-timber, in 1777, 116 loads; oak-plank, in 1777, 37 loads; oak-bark, linen-rags, wheat, oats, barley, beans and pease, apples; linen-yarn, in 1777, 116 tons; oak-knees, for ships; earthen ware, pearl-ashes, smalt, Rhenish wine, vinegar; pipe, hoghead, and barrel staves; firkin-staves, chestnuts, madder; tanned leather, in 1777, 11000 pounds; seal-skins, mineral waters, beech-timber, calf-pelts, horse-hides, mats, flax-feed, bar-iron, linens, wood-hoops, wooden clocks, tree-nails, caraway-seeds, juniper-berries, drugs.

*From Holland.* Flax, about 350 tons annually; flax-feed, about 500 hogheads annually; madder, clover-feed, mats, wood-hoops for coopers; linen-yarn, in 1777, 11,330 pound weight; old-iron, bat-

ter and cheese, cinnamon, unbound books, garden-seeds, tanned leather, wheat, oats, barley, pease and beans, pearl-ashes, smalt, wainfcoats, Rhenish wine, oak-bark, iron nails, cork, bridges thread, inel, wood-ashes, galley-tiles, writing paper, wooden clocks, taras, oakhum, saccharum saturni, white-lead, mineral waters, flower-roots, burrs for mill-stones, goose-quills, liquorice-juice, onions, hard soap, linen-rags, oak-timber, goat-skins, red-lead, apples, vinegar.

*From France.* Wine, walnuts, chestnuts, prunes, cork, brandy, pickles, apples, olives, fuccads, capers, anchovies, dried plums, almonds, salt, rosin, vinegar, verdigrease.

*From Spain.* Wine and oil, grapes, figs, almonds, raisins, lemons and oranges, salt, cork, brandy, Jesuits-bark, cow-hides, reeds, lemon-juice, drugs, to-fia, and turpentine.

*From Portugal.* Wine and oil, raisins, cork, salt, lemons and oranges, figs, reeds, onions, fuccach, drugs, fuccads, rosin.

*From Guernsey.* French, Spanish, and Portuguese wines; rosin, cork, apples and pears; brandy, chestnuts and walnuts; pickles, capers, olives, anchovies, cows, cyder, prunes.

*From Ireland;* butter.

*From Gibraltar.* Spanish and Portuguese wines.

*From Italy.* French, Levant wine, currants) salad-oil, rough and polished marble, gum-arabic, cheese, anchovies, brimstone.

*From Sicily;* salt.

*From North America,* (before the differences with our colonies.) Rice, indigo, tar, pitch, turpentine, pine-plank, lignum-vitæ, barrel and hoghead staves, ox and cow hides, deer-skins, otter and racoon skins, logwood, mahogany, fir-plank, fago-powder, muscovado sugar, rum.

*From the West Indies.* Rum, muscovado sugar, indigo, cotton-wool, cow-hides, mahogany, logwood, and fullic; coffee-berries, fuccads, pimento.

## EXPORTS.

*To Denmark.* Coals, red-iron, fire-grates, thread-stockings.

*To Norway.* Lead, earthen-ware, strong beer, glass-bottles, tow, printed linen, printed paper, tanned leather, hard-ware, woollen drapery, bricks, wheat, flour, small coals, malt, haberdashery.

*To Sweden.* Hard-ware, woollen drapery, cotton-stuffs, velverets, worsted hose, silk-stuffs, porter, stone-ware, lead, tanned leather.

*To Russia.* Coaches and chariots, with braces and harness, silk-stuffs, household-furniture, saddlery-ware, coals, Spanish salt, strong-beer, glass-bottles, checked linen furniture, diaper, velvets, worsted stockings, printed linen handkerchiefs, fine linen, clocks, haberdashery, hard-ware, oil of vitriol, sal-ammoniac, wine.

*To Poland.* Coaches and chariots, with braces and harness; silk-stuffs, alum, worsted stockings, rum, herrings, mahogany furniture, stone-ware, small coals, hats.

*To Germany.* Household furniture, glass-bottles, porter and strong-beer, oil of vitriol, earthen ware, millinery ware, rum, coals, sail-cloth, lead, carpeting, worsted stockings.

*To Holland.* Lead, in 1776, 1650 tons; in 1777, 1,500

Leith. 1400 tons; salmon, porter and strong-beer; carpeting, coals, oil of vitriol, Spanish and French wines a small quantity, steel, rod-iron, velvet, rum, silks, fluffs, woollen cloth, earthen ware, fire-grates, saddlery.

*To France.* Coaches and chariots, with braces and harness; a few.

*To Spain.* Linens and damasks; strong-beer and porter; iron-hoops, small coals, sail-cloth, tarred cordage, wheat, flour, stone-ware, small-beer, deals and cuts of deals, barley, glass-bottles, silk-gauze.

*To Portugal.* Glass-bottles, strong-beer, packing-mats, sail-cloth, barley and big; wheat, wheat-flour, iron-hoops, pipe-falves, dried cod-fish, small coals.

*To Gibraltar.* Coals and bricks, linens, glass-bottles, household furniture, beer and porter, iron-hoops.

*To Guernsey;* coals, glass-bottles.

*To Ireland;* porter and strong-beer, barrel-staves, glass-bottles, biscuit.

*To North America,* (before the differences with that country.) Great quantities of linen; household furniture, wearing apparel, writing-paper, printing and brown paper, books, haberdashery, stone-ware, porter and strong-beer, saddlery-ware, hatted hose, thread ditto, sewing-thread, wrought iron, hats, coals, spades, scythes, and corn-hooks; waggon-wheels, window-glass, cordage and sail-cloth, bricks, shoes, carpeting, lawns and gauzes, printed linen handkerchiefs, mens shirts, clocks; French, Spanish, and Portuguese wines; glass-bottles.

*To the West Indies.* Linens, herrings, household furniture, wood hoops for coopers, coals and bricks; French, Spanish, and Portugal wines; negroes, cloathing, hats, shoes, saddlery ware, thread-hose, sewing-thread, sugar-boilers, nails, strong-beer and porter, haberdashery, smiths and joiners tools, ploughs and furniture, yeltn pots, blistered steel, iron crows, mule-harnes, fish-oil, medicines, chaifes with harness, sail-cloth and cordage, lime and lime-stones, linen handkerchiefs, wearing apparel, wheat-flour and bread, woollen drapery, ling-fish; hulled barley, oats, pease, and beans; horses, writing-paper, books, blanketing, iron-hoops, stationary ware, ships anchors, cast-iron work, window-sashes, cutlery-ware.

Oysters began to be exported from Leith for London in the year 1773. They are taken from their beds in the Forth to the Medway and other rivers in the neighbourhood of London, where they fatten for the consumption of that metropolis. This oyster-trade is carried on with so much so much avidity, that, according to Mr Arnot, if the banks on the Forth are not more sparingly dragged, they must of necessity be soon exhausted. As the quantity exported hath diminished, however, the price hath increased. The first year the oysters were sold at 4s. per barrel.

The shipping at Leith render the demand for ropes, sail-cloth, and cordage, very considerable. There are three different companies who carry on these manufactures, besides some private persons who deal less considerably. The first of these companies was established in the beginning of the present century; and about 12 years ago made, perhaps, larger dividends among the partners than any trading or manufacturing company in the nation. The three companies at present employ about 150 weavers, flax-dressers, and spinners

of rope-yarn, 60 rope-makers, and 450 spinners of flax.

In the middle of the last century, a manufactory of green glass was established at the citadel of Leith. Chopin-bottles were sold at 4s. 6d. per dozen, and other bottles in proportion. Soon afterwards this article was manufactured also in North Leith; and, in 1707, chopin-bottles were sold at 2s. 6d. per dozen, and so proportionably. The present Bottle-house Company was established in 1746. They began work in the bottle-house of North-Leith; but that house being burned down during the first year of the partnership, a new house was built on South-Leith sands in 1747, and an additional one in 1764. The annual expence of both houses is between 8000 or 9000*l*.

The manufactures of soft-soap and candles were erected by William St Clair of Roslin and some merchants; the former in 1750, and the latter in 1770; a manufactory of hard-soap was also established in 1770 by David Neilson. Besides these, there is also a sugar-house, and a considerable manufactory for making cards with which wool is combed.

The inhabitants of Leith were divided into four classes; and these erected into corporations by the queen dowager, Mary of Lorraine. These were mariners, maltmen, trades, and traffickers. The first of these consisted of ship-masters and sailors; the second of malt-makers and brewers; the third of coopers, bakers, smiths, wrights, &c.; and the fourth, of merchants and shop-keepers. Of these corporations the mariners are the most considerable. They obtained from Mary of Lorraine a gift, afterwards ratified by William and Mary, of one penny duty on the ton of goods in the harbour of Leith, for the support of their poor. This duty, which not many years ago did not amount to 40*l*. a-year, now rises from 70*l*. to 120*l*. as trade flourishes. For the same purpose the ship-masters also pay 6*d*. a-pound out of their own wages annually; and the like sum they give upon the wages of their sailors. From these and other donations, this corporation is enabled to pay from 600*l*. to 700*l*. a-year to their poor. Opposite to South-Leith church there is a large house belonging to them, called the *Trinity hospital*, because originally consecrated to the Holy Trinity. In this house some of their poor used formerly to be maintained, but now they are all out-pensioners. Besides other apartments, this hospital contains a large handsome hall for the meetings of the corporation. Adjoining to the school-house there is another hospital, called *king James's hospital*; and bears upon its front the cipher and arms of that prince. Here some poor women belonging to the other corporations are maintained.

As the town of Leith was very ill supplied with water, and the streets were neither properly cleaned nor lighted, an act was passed for remedying these defects in the year 1771, appointing certain persons from among the magistrates of Edinburgh, lords of session, inhabitants of Edinburgh and Leith, and members of the corporations of Leith, *commissioners of police*; empowering them to put this act in execution; and, for that purpose, to levy a sum not exceeding 6*d*. in the pound upon the valued rent of Leith. The great change which has since taken place on the streets of Leith shows the good effect of this act, and that it hath

both

Leland. Both been judiciously prepared, and attentively executed.

LELAND (John), the great English antiquary, was born in London, about the year 1507. Having lost his parents when a child, he had the good fortune to find a friend and patron in one Mr Thomas Miles, who placed him in St Paul's school, of which the grammarian Lillye was master. From that school he was sent to Christi's college, Cambridge; whence, after some years residence, he removed to All-Souls, Oxford. From Oxford he went to Paris, chiefly with a design to study the Greek language, which at that time was but little understood in this kingdom. On his return to England he took orders, and was soon appointed chaplain to king Henry VIII. who also gave him the rectory of Poppeling, in the marshes of Calais, appointed him his librarian, and in 1533 granted to him, by commission under the great seal, the office of king's antiquary; an office never borne by any other person before or since. By this commission he was empowered to search for ancient writings in all the libraries of colleges, abbeys, priories, &c. in his majesty's dominions. We are told by his last biographer, that he renounced popery soon after his return to England; but he quotes no authority. Be this as it may, in 1536, he obtained a dispensation to keep a curate at Poppeling, and set out on his journey in search of antiquities. In this employment he spent six years, during which time he visited every part of England where monuments of antiquity were to be expected. After his return, in the year 1542, he was presented by the king to the rich rectory of Haseley in Oxfordshire; and in the following year he gave him a prebend of King's-college, now Christi's church, in Oxford, besides that of east and west Knowle, in the cathedral of Salisbury. Being thus amply provided for, he retired to a house of his own in the parish of St Michael le Querne in London, where he spent six years more in digesting the materials which he had collected. King Henry VIII. died in 1547; and in a short time after, poor Leland lost his senses. He was at first seized with a deep melancholy, which was succeeded by a total deprivation of his reason. In this dreadful state he continued till the beginning of the year 1552, when he was happily released by death. He was buried in the church of St Michael le Querne, which was destroyed by the fire in 1666. Mr Leland is remembered as a man of great learning, an universal linguist, an excellent Latin poet, and a most indefatigable and skilful antiquary. On his death, king Edward VI. gave all his papers to Sir John Cheeke, his tutor and Latin secretary of state. The king dying, and Sir John being obliged to leave the kingdom, he gave four folio volumes of Leland's collections to Humphrey Purefoy, Esq; which, in 1612, were by his son given to William Burton, author of the history of Leicestershire. This gentleman also became possessed of the Itinerary in 8 vols fol. which, in 1632, he deposited in the Bodleian library. Many other of Leland's manuscripts, after the death of Sir John Cheeke, fell into the hands of lord Paget, Sir William Cecil, and others, which at last fortunately came into the possession of Sir John Cotton. These manuscripts were of great use to all our subsequent antiqua-

rians, particularly Camden, Sir William Dugdale, Stowe, Lambard, Dr Batteley, Ant. Wood, &c. His Itinerary throughout most part of England and Wales, was published by Mr Hearne, 9 vols 8vo, in 1710-11; as was also his *Collectanea de rebus Britannicis*, 6 vols 8vo, in 1715.

LELY (Sir Peter), an excellent painter, born in Westphalia, in the year 1617. He was placed as a disciple with Peter Grebber at Haerlem; and in 1641 was induced, by the encouragement Charles I. gave to the fine arts, to come to England: he became state-painter to Charles II., who knighted him; and being as complete a gentleman as a painter, that king took pleasure in conversing with him. He practised portrait-painting, and succeeded so well that he excelled all his contemporaries; on which account he was always involved in business. Yet the critics remark, that he preserved in almost all his female faces a drowsy sweetness of the eyes peculiar to himself; for which he is reckoned a mannerist. The hands of his portraits are remarkably fine and elegantly turned; and he frequently added landscapes in the back-grounds of his pictures, in a style peculiar to himself, and better suited to his subject than most men could do. He excelled likewise in crayon-painting. He died in 1680.

LEMBERG, a town of Poland, capital of Red Russia, seated in the palatinate of Lemburg, on the river Peltau. It is pretty well fortified, and defended by two citadels, one of which is seated on an eminence without the town. The square, the churches, and the public buildings, are magnificent; and it is a large and rich trading place. It has a Roman-Catholic archbishop, and an Armenian as well as a Russian bishop; but the Protestants are not tolerated. This city was reduced to the last extremity by the rebel Cossacks and Tartars, and was forced to redeem itself with a large sum of money. In 1672, it was besieged in vain by the Turks; but in 1704, was taken by storm by Char. XII. of Sweden. E. Long. 24. 46. N. Lat. 49. 51.

LEMERY (Nicholas), a celebrated chemist, born at Rouen in Normandy in 1645. After having made the tour of France, he, in 1672, commenced an acquaintance with M. Martyn apothecary to Monsieur the Prince; and performed several courses of chemistry in the laboratory of this chemist at the Hotel de Conde; which brought him to the knowledge and esteem of the prince. He provided himself at length with a laboratory of his own, and might have been made a doctor of physic; but he chose to continue an apothecary, from his attachment to chemistry, in which he opened public lectures; and his confluence of scholars was so great as scarcely to allow him room to perform his operations. The true principles of chemistry in his time were but ill understood; Lemery was the first who abolished the senseless jargon of barbarous terms, reduced the science to clear and simple ideas, and promised nothing that he did not perform. In 1681, he was disturbed on account of his religion; and came to England, where he was well received by Charles II.: but affairs not promising him the same tranquillity, he returned to France, and sought for shelter under a Doctor's degree; but the revocation of the edict of Nantz drove him into the Romish communion to avoid persecution. He then became associate chemist and pensionary in  
the

Lely  
&  
Lemery.

the royal academy of sciences, and died in 1715. He wrote, A course of chemistry; An universal pharmacopœia; An universal treatise of drugs; and, A treatise on Antimony."

LEMING, in zoology. See Mus.

LEMMA, in mathematics, a proposition which serves previously to prepare the way for the more easy apprehension of the demonstration of some theorem, or construction of some problem.

LEMNA, DUCK-MEAT; a genus of the diandria order, belonging to the monocœia class of plants. There are three species, all natives of Britain, growing frequently in ditches and the shallow parts of stagnant waters. All of them are acceptable food for ducks and geese.

LEMNIAN EARTH, *Terra Lemnia*, a medicinal, astringent sort of earth, of a fatty consistence and reddish colour; used in the same cases as ROSE. It has its name from the island of Lemnos, whence it is chiefly brought. Many form it into round cakes, and impress a seal upon it; whence it is also called *terra sigillata*.

LEMNIUS (Lævinus), a famous physician, born at Zirc-Zee in Zealand, in 1505. He practised physic with applause; and after his wife's death being made priest, became canon of Zirc-Zee, where he died in 1560. He left several esteemed works, the principal of which is entitled *De occultis naturæ miraculis*.

LEMNOS, (anc. geog.) a noble island in the Ægean sea, near Thrace, called *Dipolis*, from its consisting of two towns, into the forum of which mount Athos casts its shadow at the solstice, (Pliny); in compass 112 miles. An island sacred to Vulcan, (Val. Flaccus.) Famous for its astringent earth, used for consolidating wounds.

LEMON, in botany. See CITRUS.

LEMONADE, a liquor prepared of water, sugar, and lemon or citron juice; it is very cooling and grateful.

LEMUR, or MAKI, in zoology, a genus of quadrupeds belonging to the order of primates, the characters of which are these: There are four fore teeth in the upper jaw, the intermediate ones being remote; and six long, compressed, parallel teeth in the under jaw; the dog-teeth are solitary, and the grinders are somewhat labated. There are five species, viz.

1. The tardigradus, a small animal found in the island of Ceylon. It is of a very singular construction, and perhaps longer in proportion to its thickness than any other quadruped. The head is roundish, with a prominent nose; the legs are long and thick, and the feet resemble those of a monkey; it has no tail. It lives in the woods, and feeds on fruits; is a tender animal; has the sense of smell very acute, and the action of an ape; and is very agile, though its name implies the contrary.

2. The mongoose inhabits Madagascar and the islands to the eastward as far as Celebes, is about the size of a cat; hath the whole upper part of the body covered with long, soft, and thick fur, a little curled or waved, of a deep brownish ash-colour; the tail very long, covered with the same sort of hair, and of the same colour. It lives on fruits, turns its tail over its head to protect it from rain, and sleeps on trees; it is very sportive and good-natured, and very tender.

3. The catia, or arch-tailed maki, inhabits Madagascar and the neighbouring isles. It is of the size of a cat; has the hair on the top and hind-part of the head of a deep ash-colour, the back and sides reddish, the belly and insides of the limbs white; all its hair very soft, close and fine, and erect like the pile of velvet; the tail is twice the length of the body. It is very good-natured, and has all the life of a monkey, without its mischievous disposition; it is very cleanly, and has a weak cry. In a wild state they go in troops of 30 or 40, and are easily tamed when taken young.

4. The caudatus niger, or rusted maki, is also an inhabitant of Madagascar. It is somewhat larger than the last, and hath long hair standing out round the sides of the head like a ruff; a long tail; the colour of the whole animal generally black, but sometimes white spotted with black. In a wild state it is very fierce; and makes such a violent noise in the woods, that the cries of two might be easily mistaken for the noise made by a hundred.

5. The volans, or flying maki, resembles a bat; being furnished with a strong membrane like that animal, by which it is enabled to fly. It inhabits the country about Guzarat, the Molucca isles, and the Philippines; feeds on the fruits of the trees, and is very distinct both from the bat and flying squirrel. Its history, however, is very little known.

LEMURES, in antiquity, sprites or hobgoblins; restless ghosts of departed persons, who return to terrify and torment the living.—These are the same with larvæ, which the ancients imagined to wander round the world, to frighten good people, and plague the bad. For which reason, at Rome they had *lemuria*, or feasts instituted to appease the manes of the deceased.

LEMURIA, or LEMURALIA, a feast solemnized at Rome on the ninth of May, to pacify the manes of the dead, or in honour of the lemures.—The institution of this feast is ascribed to Romulus, who, to rid himself of the phantom of his brother Remus (whom he had ordered to be murdered) appearing always before him, ordained a feast called after his name *remuria*, or *lemuria*.—In the *lemuria*, they offered sacrifices for three nights together; during which time all the temples of the gods were shut up, nor were any marriages permitted. There were a world of ceremonies in this feast, chiefly intended to exorcise the lemures, and prevent their appearing or giving any disturbance to the living.

LENA, a great river of Siberia in Asia, which takes its rise in N. Lat. 52. 30. and E. Long. 124. 30. from Ferro. After traversing a large tract of land, it divides itself into five branches about Lat. 73°. Three of these run westward, and two eastward, by which it discharges itself into the icy Sea. Its three western mouths lie in 143° E. Long. from Ferro, but the eastern ones extend to 153°. The current is every where slow, and its bed entirely free from rocks. The bottom is sandy, and the banks are in some places rocky and mountainous. Sixteen large rivers fall into the Lena during its course to the northern ocean.

LENÆA, in antiquity, a festival of Bacchus, surnamed *Lenaus*, from a wine-press. Besides the usual ceremonies at feasts sacred to this god, it was remarkable

able for poetic contentions, and the acting of tragedies.

LENFANT (James), a learned French writer born in 1661. After studying at Saumur, he went to Heidelberg, where he received imposition of hands for the ministry in 1684. He discharged the functions of this character with great reputation there, as chaplain of the electress dowager of Palatine, and pastor in ordinary to the French church. The descent of the French into the Palatinate obliged our author to depart from Heidelberg in 1688. He went to Berlin, where the elector Frederic, afterward king of Prussia, appointed him one of the ministers. There he continued 39 years, distinguishing himself by his writings. He was preacher to the queen of Prussia, Charlotta Sophia; and after her death, to the late king of Prussia. In 1707, he took a journey to England and Holland, where he had the honour to preach before queen Anne; and might have settled in London, with the title of *chaplain to her majesty*. In 1712 he went to Helmstadt, in 1715 to Leipzig, and in 1725 to Breslaw, to search for rare books and MSS. It is not certain whether it was he that first formed the design of the *Bibliothèque Germanique*, which began in 1720; or whether it was suggested to him by one of the society of learned men, which took the name of *Anonymus*, and who ordinarily met at his house. He died in 1728. His principal works are, 1. The history of the Council of Constance, 2 vols 4to. 2. A history of the Council of Pisa, 2 vols 4to. 3. The New Testament translated from the Greek into the French, with Notes by Beausobre and Lenfant, 2 vols 4to. 4. The history of pope Joan, from Spanheim's Latin dissertation. 5. Several pieces in the *Bibliothèque Choisie, La Republique des Lettres, La Bibliothèque Germanique*, &c.

LENGET (Nicholas du Fresnoy, l'abbé), born at Beauvais in France, 1674, was a most fertile and useful French author on a variety of subjects, historical, geographical, political, and philosophical. The following deserve particular notice, 1. A method of studying history, with a catalogue of the principal historians of every age and country, published in 1713; a work which established his reputation as an historical writer: it was translated into most of the modern languages, particularly our own, with considerable improvements, by Richard Rawlinson, LL.D. and F.R.S. and published at London in 1730, in 2 vols 8vo. 2. A copious abridgment of universal history and biography, in chronological order, under the title of *Tablettes chronologiques*; which made its first appearance at Paris in 1744, in 2 vols small 8vo, and was universally admired by the literati in all parts of Europe. The author attended with great candour, as every writer ought, to well-founded, judicious criticisms. In future editions, he made several alterations and improvements, and from one of these, we believe that of 1759, an English translation was made, and published at London in 1762, in 2 vols large 8vo. Du Fresnoy died in 1755: the Paris edition of 1759 was printed from the author's corrected copy; and the impression being sold off, another edition appeared in 1763, with considerable improvements by an unknown editor: to the biographical part, a great number of names of respectable persons are added, not to be found in the former edition; and it has this superior advantage in the hi-

storical parts, that the general history is brought down to the year 1762. Du Fresnoy, however, has loaded his work with catalogues of saints, martyrs, councils, synods, heresies, schisms, and other ecclesiastical matters, fit only for the libraries of popish convents and seminaries.

LENGTH, the extent of any thing material from end to end. In duration, it is applied to any space of time whether long or short.

LENGTHENING, in ship-carpentry, the operation of cutting a ship down across the middle, and adding a certain portion to her length. It is performed by sawing her planks asunder in different places of her length, on each side of the midship-frame, to prevent her from being too much weakened in one place. The two ends are then drawn apart to a limited distance; which must be equal to the proposed addition of length. An intermediate piece of timber is next added to the keel, upon which a sufficient number of timbers are erected, to fill up the vacancy produced by the separation. The two parts of the keelson are afterwards united by an additional piece which is scored down upon the floor-timbers, and as many beams as may be necessary are fixed across the ship in the new interval. Finally, the planks of the side are prolonged so as to unite with each other; and those of the ceiling refitted in the same manner; by which the whole process is completed.

LENEICIA, a strong town of Poland, and capital of a palatinate of the same name, with a fort seated on a rock. The nobility of the province hold their diet here. It stands in a morass on the banks of the river Bura, in E. Long. 19. 25. N. Lat. 52. 12.

LENOX, or DUNBARTON-Shire, a county of Scotland, stretching 24 miles in length and 20 in breadth, is bounded on the south by the river and frith of Clyde, on the west by Lochlong and Argyleshire, on the north by the Grampian hills, and on the east by Monteith and Stirlingshire. Great part of this county consists of hills and heaths, fit for nothing but pasturage and sport; even in the lower lands, the soil is not extremely fertile: yet the face of the country is agreeably diversified with hill, dale, mountain, heath, streams, lakes, woods, and fields of corn: the shire is likewise beautified with a great number of agreeable seats and plantations, belonging to gentlemen of fortune. Part of this county is washed by the river Clyde in its course to the sea: even at the castle of Dunbarton, the breadth of it amounts to two miles at high-water, and it continues extending in width and depth until it joins the ocean. From the mouth of the Clyde, the two bays of Lochlong and Lochfyn make large indentations in the shire of Dunbarton. The only river of any consideration that runs through this county, is the Leven, the Lelanionius of Ptolemy, otherwise called *Levinia*, the Latin name for Lenox. The river Leven is a pure transparent pastoral stream, that warbles over a bed of pebbles, thro' a delightful vale adorned with farms, seats, woods, and plantations. It derives its origin from the great lake called *Lochlomond*, of which indeed it is the overflowing, and, after a delightful meandering course of five or six miles, disembogues itself into the Clyde at the castle of Dunbarton. But the greatest curiosity of this county is Lochlomond itself, a vast body of fresh water, supplied by subterra-

Lenox  
|  
Lent.

neous springs and rivulets, surrounded with huge mountains, extending 25 miles in length, and in some places five miles in breadth, incredibly deep in every part, interspersed with 24 verdant isles, some of which are stocked with red deer, and inhabited. Nothing can be more wildly romantic than this part of the country, during the summer-season, on the south side of the lake: the high road runs in some places through natural woods; overlung, on one hand, by steep mountains, covered with flowery heath; and on the other opening in long vistas upon the lake, terminated by green islands that seem to float upon the water. Among the rivers of this shire we shall likewise mention the water of Blane, which, though itself an inconsiderable stream, hath been rendered famous by the birth of George Buchanan, the celebrated Latin poet and historian. He was born on the north side of the lake, not far from the place called *Buchannan*, where we may behold an elegant seat belonging to the duke of Montrose, head of the noble family of Graham, so often distinguished by its loyalty, integrity, and valour. The same part of the country gave birth to the great mathematician and naturalist, Napier lord Merchiston, inventor of the logarithms. The title of *Lenox*, with the property of great part of the shire, was heretofore vested in a branch of the royal family of Stuart, with which it was reunited in the person of king James VI. whose father, Henry lord Darnly, was son to the duke of Lenox. This prince conferred the title upon his kinsman Esmé Stuart, son of John lord D'Aubigny in France: but, his race failing at the death of Charles duke of Lenox and Richmond, and the estate devolving to the crown, king Charles II. conferred both titles on his own natural son by the duchess of Portsmouth; and they are still enjoyed by his posterity. The people of Lenoxshire are chiefly Lowlanders, though in some parts of it divine service is performed in the Erse language. The most numerous clans in this district, are the Macfarlanes, the Colquhouns, and the Buchannans. They generally profess the Protestant faith, according to the Presbyterian discipline; yet some of the gentlemen follow the English ritual. The commonalty are for the most part sober, honest, and industrious; and though they live poorly, are tall, vigorous, and healthy.

**LENS**, a piece of glass, or any other transparent substance, the surfaces of which are so formed, that the rays of light, by passing through it, are made to change their direction, either tending to meet in a point beyond the lens, or made to become parallel after converging or diverging; or lastly proceeding as if they had issued from a point before they fell upon the lens. Some lenses are convex, or thicker in the middle; some concave, or thinner in the middle; some plano-convex, or plano-concave; that is with one side flat, and the other convex or concave; and some are called meniscuses, or convex on one side and concave on the other. See **DIOPTRICS**, p. 2475.

**LENT**, a solemn time of fasting in the Christian church, observed as a time of humiliation before Easter, the great festival of our Saviour's resurrection.

Those of the Romish church, and some of the Protestant communion, maintain, that it was always a fast of forty days, and, as such, of apostolical institution. Others think it was only of ecclesiastical in-

stitution, and that it was variously observed in different churches, and grew by degrees from a fast of forty hours, to a fast of forty days. This is the sentiment of Morton, bishop Taylor, du Moulin, Dailly, and others.

Anciently the manner of observing lent among those who were piously disposed, was to abstain from food till evening: their only refreshment was a supper; and then it was indifferent whether it was flesh or any other food, provided it was used with sobriety and moderation.

Lent was thought the proper time for exercising, more abundantly, every species of charity. Thus what they spared from their own bodies by abridging them of a meal, was usually given to the poor; they employed their vacant hours in visiting the sick and those that were in prison, in entertaining strangers, and reconciling differences. The imperial laws forbade all prosecution of men in criminal actions, that might bring them to corporal punishment and torture, during the whole season. This was a time of more than ordinary strictness and devotion, and therefore in many of the great churches they had religious assemblies for prayer and preaching every day. All public games and stage-plays were prohibited at this season; as also the celebration of all festivals, birth-days, and marriages, as unsuitable to the present occasion.

The Christians of the Greek church observe four lents: the first commences on the 15th of November; the second is the same with our lent; the third begins the week after Whitsuntide, and continues till the festival of St Peter and St Paul; and the fourth commences on the first of August, and lasts no longer than till the 15th. These lents are observed with great strictness and austerity; but on Saturdays and Sundays they indulge themselves in drinking wine and using oil, which are prohibited on other days.

**LENTISCUS**, in botany. See **PISTACIA**.

**LEO**, in zoology. See **FELIS**.

**LEO**, in astronomy. See there, n° 206.

**LEO X.** whose proper name was John de Medicis, is a pope ever to be remembered by Protestants, as having proved the cause of the reformation begun by Martin Luther. He had been honoured with a cardinal's hat at 14 years of age, and some years after with the dignity of legate by Julius II. He was in that quality in the army which was defeated by the French near Ravenna in 1512, where he was taken prisoner. The soldiers, who had overcome him, shewed him such great veneration, that they humbly asked his pardon for gaining the victory, besought him to give them absolution for it, and promised never to bear arms against the pope. When pope Julius died, Leo was very ill of the venereal disease at Florence, and was carried to Rome in a litter. His hurrying about every night to the cardinals of his faction, occasioned the breaking of his ulcer; and the matter which ran from it exhaled such a stench, that all the cells in the conclave, which were separated only by thin partitions, were poisoned by it. Upon this the cardinals consulted the physicians of the conclave, to know what the matter was. They, being bribed, said the cardinal de Medicis could not live a month; which sentence occasioned his being chosen pope. Thus cardinal de Medicis, then not 30 years of age, was elected pope

Lent

Leo.

L.eo

I.eon.

upon a false information; and as joy is the most sovereign of all remedies, he soon after recovered his health, so that the old cardinals had reason to repent their credulity.—He was better calculated for a temporal prince, being ambitious, politic, luxurious, a connoisseur in the fine arts, and an accomplished fine gentleman: thus qualified, it is no wonder that so young a pontiff, neglecting the true interest of his church, should avail himself of the folly of religious dupes, and publicly sell indulgences to support his prodigality, especially as he was known to disfigure Christianity itself, which he called *A very profitable fable for him and his predecessors*. In 1517, he published general indulgences throughout Europe (and ordered the priests to recommend them) in favour of those who would contribute any sum towards completing the church of St Peter; and this was the basis of the reformation. (See LUTHER and INDULGENCE.) Leo died in 1521.

It is but justice to add, that this pope was principally owing the revival of polite literature in Italy. He spared neither pains nor expence in recovering ancient manuscripts, and procuring good editions of them; he favoured the arts and sciences; and gloried in being the patron of learned and ingenious men, who in return have been very lavish in his praise. Mr Pope, in his essay on Criticism, bestows on him these harmonious lines.

But feel each Muse, in Leo's golden days,  
Starts from her trance, and trims her wether'd bays;  
Rome's ancient Genius, o'er its ruins spread,  
Shakes off the dust, and rears his rev'rend head.  
Then Sculpture and her sister Arts revive;  
Stones leap to form, and rocks begin to live;  
With sweeter notes each rising temple rung;  
A Raphael painted, and a Vida sung.

Leo (St.), a small but strong town of Italy, in the territory of the church, and duchy of Urbino, with a bishop's see. It is seated on a mountain, near the river Marrechia, in E. Long. 12. 25. N. Lat. 43. 57.

LEOMINSTER, a town of Herefordshire, in England, seated on the river Lug; which waters the north and east sides of the town. It contains one parish, about 400 houses, six wards, and the principal officer is a bailiff. It is of great note for its fine wool, has several good inns, and sends two members to parliament. W. Long. 2. 45. N. Lat. 52. 20.

LEON, an ancient town of France, in Lower Bretagne, and capital of the Lyonnaise, with a bishop's see. It is seated near the sea, in W. Long. 3. 55. N. Lat. 48. 41.

LEON, a province of Spain, with the title of a kingdom; bounded on the north by Asturias; on the west by Galicia and Portugal; and on the south by Estremadura and Castile, which also bounds it on the east. It is about 125 miles in length, and 100 in breadth; and is divided into almost two equal parts by the river Duero, or Douro. It produces all the necessaries of life, and Leon is the capital town.

LEON, an ancient and large episcopal town of Spain, and capital of the kingdom of that name, built by the Romans in the time of Galba. It has the finest cathedral church in all Spain. It was formerly more rich and populous than at present, and had the honour of being the capital of the first Christian kingdom in Spain. It is seated between two sources of the river

Ebra, in W. Long. 5. 13. N. Lat. 42. 55.

LEON (Peter Cicca de), author of the history of Peru. He left Spain his native country at 13 years of age, in order to go into America, where he resided 17 years; and observed so many remarkable things, that he resolved to commit them to writing. The first part of his history was printed at Sevil in 1553. He began it in 1541, and ended it in 1550. He was at Lima, the capital of the kingdom of Peru, when he gave the finishing stroke to it, and was then 32 years of age.

LEON de Nicaragua, a town of North America, in New Spain, and in the province of Nicaragua; the residence of the governor, and a bishop's see. It consists of about 1000 houses, and has several monasteries and nunneries belonging to it. At one end of the town is a lake which ebbs and flows like the sea. The town is seated at the foot of a volcano, which renders it subject to earthquakes. It was taken by the bucaniers in 1685, in fight of a Spanish army who were six to one. W. Long. 86. 10. N. Lat. 12. 25.

LEONARD DE NOBLET (St.), an ancient town of France, in the province of Guienne and territory of Limosin, with a considerable manufactory of cloth and paper. It is seated on the river Vienne, in E. Long. 1. 35. N. Lat. 45. 50.

LEONARDO DA VINCI. See VINCI.

LEONCLAVIUS (John), one of the most learned men of the 16th century, was a native of Westphalia. He travelled into Turkey, and collected excellent materials for composing *The Ottoman history*; and it is to him the public is indebted for the best account we have of that empire. To his knowledge in the learned languages, he had added that of the civil law; whereby he was very well qualified to translate the *Basilica*. His other versions were esteemed, tho' critics pretend to have found many faults in them. He died in 1593, aged 60.

LEONIDAS I. king of Sparta, a renowned warrior, slain in defending the straits of Thermopylae against Xerxes, 480 B. C. See SPARTA.

LEONINE, in poetry, is applied to a kind of verses which rhyme at every hemistich, the middle always chiming to the end. Of which kind we find several ancient hymns, epigrams, prophecies, &c.—For instance, Muretus speaking of the poetry of Lorenzo Gambara of Bresse, says,

*Brixia, vestra stris merdosa volumina vatis,  
Non sunt nostras tergere digna nates.*

The following one is from the school of Salernum:

*Ut vites pomam de potibus incipe cœnam.*

The origin of the word is somewhat obscure: Pasquier derives it from one Leoninus, or Leoniun, who excelled in this way, and dedicated several pieces to pope Alexander III.; others derive it from pope Leo; and others from the beast called *lion*, by reason it is the loftiest of all verses.

LEONTICE, LION'S LEAF; a genus of the monogynia order, to the hexandria class of plants. There are four species, natives of the southern parts of Europe, two of which are sometimes cultivated in this country. These are, 1. The chrysopteron with winged leaves; and, 2. The leontopetalum with decomposed leaves. Both those plants are natives of the Archipelago.

pelago islands, and also grow in the corn-fields about Aleppo in Syria, where they flower soon after Christmas. They have large tuberous roots like those of the cyclamen, covered with a dark-brown bark. The flowers sit upon naked footstalks: those of the first sort sustain many yellow flowers, but the flowers of the second are of a paler colour. Both species are propagated by seeds, which must be sown soon after they are ripe, otherwise they seldom succeed. When sent to distant countries, they must be preserved in sand. The plants are, however, very difficult to be preserved in this country: for they will not thrive in pots; and when they are planted in the full ground, the frost frequently destroys them. The best way is to sow the seed as soon as it comes from abroad, covering it with glasses in the winter to protect it from frost; and, in the spring, when the plants begin to appear, they must have free air admitted to them at all times when the weather is mild, otherwise they will be weak.

**LEONTINI**, or **LEONTIUM**, (anc. geog.) a town of Sicily on the fourth side of the river Teras, 20 miles north-west of Syracuse. The territory, called *Campi Leontini*, was extremely fertile, (Cicero): these were the *Campi Lastrigoni*, anciently so called; the feat of the *Læstrigions*, according to the commentators on the poets. The name *Leontini* is from *Leo*, the impression on their coin being a lion. Now called *Lentini*, a town situate in the Val di Noto, in the south-east of Sicily.

**LEONTIUM**, one of the twelve towns of Achaia, whether on, or more distant from, the bay of Corinth, is uncertain. *Leontium* of Sicily. See **LEONTINI**.

**LEONTODON**, **DANDELION**; a genus of the polygamia æqualis order, belonging to the syngenesia class of plants. There are nine species, of which the only remarkable one is the Taraxacum, or common dandelion, found on the road-sides, in pastures, and on the banks of ditches. Early in the spring, the leaves whilst yet white and hardly unfolded are an excellent ingredient in salads. The French eat the roots and tender leaves with bread and butter. Children that eat it in the evening experience its diuretic effects in the night, which is the reason that other European nations as well as ourselves vulgarly call it *pissi-a-bed*. When a swarm of locusts had destroyed the harvest in the island of Minorca, many of the inhabitants subsisted upon this plant. The expressed juice has been given to the quantity of four ounces three or four times a-day; and Boerhaave had a great opinion of the utility of this and other lactescent plants in visceral obstructions. Goats eat it; swine devour it greedily; sheep and cows are not fond of it, and horses refuse it. Small birds are fond of the seeds.

**LEONURUS**, **LION'S-TAIL**; a genus of the gymnospermia order, belonging to the didynamia class of plants.

*Species.* 1. The Africana, with spear-shaped leaves, is a native of Ethiopia. It rises with a shrubby stalk seven or eight feet high, sending out several four-cornered branches, garnished with oblong narrow leaves, acutely indented on their edges, hairy on their upper side, and veined on the under side, standing opposite. The flowers are produced in whorls, each of the branches having two or three of these whorls towards their ends. They are of the lip kind, shaped somewhat like those of the dead nettle; but are much longer,

and covered with short hairs. They are of a golden scarlet colour, so make a fine appearance. The flowers commonly appear in October and November, and sometimes continue till the middle of December, but are not succeeded by seeds in this country. There is a variety with variegated leaves which is admired by some, but the whorls of flowers are smaller than those of the plain sort. 2. The *nepestifolia*, with oval leaves, is a native of the Cape of Good Hope. This rises with a square shrubby stalk about three feet high, sending out several four-cornered branches, garnished with oval crenated leaves, rough on their under side like the dead-nettle, but veined on the upper side, and placed opposite. The flowers come out in whorls like those of the former sort, but are not so long nor so deep-coloured. They appear at the same season with the first, and continue as long in beauty. There are three other species, but the above are the most remarkable.

*Culture.* Both sorts are propagated by cuttings, which should be exposed to the air long enough to harden the shoots, and planted in the beginning of July, after which they will take root very freely. They should be planted in a loamy border to an eastern aspect; and if they are covered closely with a bell or hand-glass to exclude the air, and shaded from the sun, it will forward their putting forth roots. As soon as they have taken good root, they should be taken up and planted each in a separate pot filled with soft loamy earth, and placed in the shade till they have taken new root. In October they must be removed into the green-house.

**LEOPARD.** See **FELIS**.  
**LEOPARD'S BANE**, in botany. See **DORONICUM**.

**LEPANTO**, a strong and very considerable town of Turkey in Europe, and in Livadia, with an archbishop's see and a strong fort. It is built on the top of a mountain, in form of a sugar-loaf; and is divided into four towns, each surrounded by walls, and commanded by a castle on the top of the mountain. The harbour is very small, and may be shut up by a chain, the entrance being but 50 feet wide. It was taken from the Turks by the Venetians in 1687; but was afterwards evacuated, and the castle demolished in 1699, in consequence of the treaty of Carlowitz. It was near this town that Don John of Austria obtained the famous victory over the Turkish fleet in 1571. The produce of the adjacent country is wine, oil, corn, and rice. Turkey leather is also manufactured here. The wine would be exceedingly good if they did not pitch their vessels on the inside, but this renders the taste very disagreeable to those who are not accustomed to it. The Turks have six or seven mosques here, and the Greeks two churches. It is seated on a gulph of the same name, in E. Long. 22. 13. N. Lat. 38. 34.

**LEPIDIUM**, **DITTANDER**, or **Peppermint**, a genus of the siliculosa order, belonging to the tetradynamia class of plants. There are 19 species, of which the only remarkable one is the latifolium or common dittander. This is a native of many parts both of Scotland and England. It hath small, white, creeping roots, by which it multiplies very fast, and is difficult to be eradicated after it has long grown in any place. The stalks are smooth, rise two feet high, and send

out

Lepidoptera  
||  
Lepus.

out many hide-branches. The flowers grow in close bunches towards the top of the branches, coming out from the side; they are small, and composed of four small white petals. The seeds ripen in autumn. The whole plant has a hot biting taste like pepper; and the leaves have been often used by the country-people to give a relish to their viands instead of that spice, whence the plant has got the appellation of *poor man's pepper*. It is reckoned an antiscorbutic, and was formerly used instead of the *borle raddish* *scurvey-grass*.

**LEPIDOPTERA**, in zoology, an order of insects, with four wings, which are covered with imbricated squamule. See ZOOLOGY.

**LEPIUM**, in natural history, a genus of fossils of the harder gypsum, composed of very small particles, and of a less glittering hue.

There is only one species of this genus, being one of the least valuable and most impure of the class of gypsums. It is of an extremely rude, irregular, coarse, and unequal structure; a little soft to the touch, of a very dull appearance, and of different degrees of a greyish white. It is burnt in plaster for the coarser works; it calcines very slowly and unequally, and makes but a very coarse and ordinary plaster.

**LEPROSY**, a foul cutaneous disease, appearing in dry, white, thin, scurfy scabs, either on the whole body, or only some part of it, and usually attended with a violent itching and other pains. See (the *Index* subjoined to) MEDICINE.

**LEPTODECORMOMBES**, in natural history, a genus of fossils of the order of the selenite; consisting of 10 planes, each so nearly equal to that opposite to it as very much to approach to a decahedral parallelepiped, though never truly or regularly so.

Of this genus there are only five known species. 1. A thin, fine, pellucid, and slender-streaked one, with transverse striae, found in considerable quantities in the strata of clay in most parts of England, particularly near Heddington in Oxfordshire. 2. A thin, dull-looking, opaque, and slender-streaked one, more scarce than the former, and found principally in Leicester-shire and Staffordshire. 3. A thin fine-streaked one, with longitudinal striae, found in the clay-pits at Richmond, and generally lying at great depths. This has often on its top and bottom a very elegant smaller rhomboide, described by four regular lines. 4. A rough kind, with thick transverse striae, and a scabrous surface, very common in Leicestershire and Yorkshire. And, 5. A very short kind, with thick plates, common in the clay-pits of Northamptonshire and York-shire.

**LEPTOPOLYINGLIMI**, in natural history, a genus of fossil shells, distinguished by a number of minute teeth at the cardo; whereof we find great numbers at Harwich-cliff, and in the marle-pits of Suffex.

**LEPTURA**, in zoology, a genus of insects belonging to the order of coleoptera, the characters of which are these:—The feelers are bristly; the elytra are attenuated towards the apex; and the thorax is somewhat cylindrical. There are 25 species, principally distinguished by their colour.

**LEPUS**, in zoology, a genus of quadrupeds belonging to the order of glires. The characters are these:—They have two fore-teeth in each jaw; those

in the upper-jaw are double, the interior ones being smallest. There are four species, viz.

1. The timidus, or hare, has a short tail; the points of the ears are black; the upper-lip is divided up to the nostrils; the length of the body is generally about a foot and a half; and the colour of the hair is reddish, interspersed with white. The hare is naturally a timid animal. He sleeps in his form, or feat, during the day; and feeds, copulates, &c. in the night. In a moon-light evening, a number of them are sometimes seen sporting together, leaping and pursuing each other: But the least motion, the falling of a leaf, alarms them; and then they all run off separately, each taking a different route. They are extremely swift in their motion, which is a kind of gallop, or a succession of quick leaps. When pursued, they always take to the higher grounds: as their fore-feet are much shorter than the hind-ones, they run with more ease up-hill than down-hill. The hare is endowed with all those instincts which are necessary for his own preservation. In winter he chooses a form exposed to the south, and in summer to the north. He conceals himself among vegetables of the same colour with himself. Mr Fouilloux says, that he observed a hare, as soon as he heard the sound of the horn, or the noise of the dogs, although at a mile's distance, rise from her feat, swim across a rivulet, then lie down among the rushes, and by this means evade the scent of the dogs. After being chased for a couple of hours, a hare will sometimes push another from his form, and lie down in it himself. When hard pressed, the hare will mingle with a flock of sheep, run up an old wall and conceal himself among the grass on the top of it, or cross a river several times at small distances. He never runs against the wind, or straight forward; but constantly doubles about, in order to make the dogs lose their scent.

It is remarkable, that the hare, although ever so frequently pursued by the dogs, seldom leaves the place where she was brought forth, or even the form in which she usually sits. It is common to find them in the same place next day, after being long and keenly chased the day before. The females are more gross than the males, and have less strength and agility; they are likewise more timid, and never allow the dogs to approach so near their form before rising as the males. They likewise practise more arts, and double more frequently, than the males.

The hare is diffused almost over every climate; and, notwithstanding they are every-where hunted, their species never diminishes. They are in a condition of propagating the first year of their lives; the females go with young about 30 days, and produce four or five at a time; and as soon as they have brought forth, they again admit the embraces of the male; so that they may be said to be always pregnant. The eyes of the young are open at birth; the mother suckles them about 20 days, after which they separate from her, and procure their own food. The young never go far from the place where they were brought forth; but still they live solitary, and make forms about 30 paces distant from each other: Thus, if a young hare be found any-where, you may almost be certain of finding several others within a very small distance. The hare is not so savage as his manners would indicate. He

Lepus.

is gentle, and susceptible of a kind of education. He is pretty easily tamed, and will even show a kind of attachment to the people of the house: But still this attachment is not so strong or lasting as to engage him to become altogether domestic; for although taken when very young, and brought up in the house, he no sooner arrives at a certain age, than he takes the first opportunity of recovering his liberty, and flying to the fields. The hare lives about seven or eight years. He feeds upon grass, and other vegetables. His flesh is excellent food.

Mr Pennant describes a species called the *Alpine hare*, which inhabits the summits of the Highland mountains, never descends into the vales, or mixes itself with the common kind, which is frequent in the bottoms: it lives among the rocks with ptarmigans, natives of the loftiest situations. It does not run fast; and, if pursued, is apt to take shelter beneath stones and in clefts of rocks: is easily tamed, and is very sprightly and full of frolic. It is fond of honey and carraway comfits, and is observed to eat its own dung before a storm. It is less than the common hare, weighing only  $6\frac{1}{2}$  lb. whereas the former weighs from 8 lb. to 12 lb. Its hair is soft and full; the predominant colour grey, mixed with a little black and tawny. In winter it entirely changes to a snowy whiteness, except the edges and tips of the ears, which retain their black colour. The alteration begins in September, and first appears about the neck and rump. In April it again resumes its grey coat. This is the case in Styria; but in the polar tracts it never varies from white, the perpetual colour of the country. In the intermediate climates between temperate and frigid, such as Scotland and Scandinavia, it regularly experiences these vicissitudes of colour.

Hares are very subject to fleas. Linnæus tells us, that the Dalecarlians make a sort of cloth, called *silt*, of the fur; which, by attracting these insects, preserves the wearer from their troublesome attacks. The hair of this creature makes a great article in the hat-manufacture; and, as our country cannot supply a sufficient quantity, a great deal is annually imported from Russia and Siberia. The hare was reckoned a great delicacy among the Romans; the Britons, on the contrary, thought it impious even to taste it: yet this animal was cultivated by them, either for the pleasure of the chase, or for the purposes of superstition; as we are informed, that Boadicea, immediately before her last conflict with the Romans, let loose a hare she had concealed in her bosom, which taking what was deemed a fortunate course, animated her soldiers by the omen of an easy victory over a timid enemy.

2. The cuniculus, or rabbit, has a very short tail, and naked ears. Its native country is Spain, where they were formerly taken with ferrets, as is practised in this country at present; which animals were first introduced into that country from Africa. They love a temperate and warm climate, and are incapable of bearing great cold; so that in Sweden they are obliged to be kept in houses. They abound in Britain; their furs make a considerable article in the hat-manufactories; and, of late, such part of the fur as is unfit for that purpose, has been found as good as feathers for stuffing beds and bolsters. Numbers of the skins are annually exported into China. The English counties

mostly noted for rabbits are Lincolnshire, Norfolk, and Cambridgeshire. Methold, in the last county, is famous for the best kind for the table: the soil there is sandy, and full of mosses and the *carex* grass. Rabbits swarm in the isles of Orkney, where their skins form a considerable article of commerce. Excepting otters, brown rats, common mice, and shrews, no other quadrupeds are found there. The rabbits of those isles are in general grey; those which inhabit the hills grow hoary in winter.—Formerly the silver-haired rabbits were in great esteem for lining of clothes, and their skins sold for three shillings a-piece; but since the introduction of more elegant furs, their price has fallen to 6d. The *Sunk Island* in the Humber was once famous for a mouse-coloured species, which has since been extirpated by reason of the injury they did to the banks by burrowing.

The fecundity of the rabbit is still greater than that of the hare. They will breed seven times in the year, and the female sometimes brings eight young ones at a time. Supposing this to happen regularly for four years, the number of rabbits from a single pair will amount to 1,274,840. By this account we might justly apprehend being overlooked with these animals; but a great number of enemies prevents their increase; not only men, but hawks and beasts of prey making dreadful havoc among them. Notwithstanding all these different enemies, however, we are told by Pliny and Strabo, that they once proved such a nuisance to the inhabitants of the Balearic islands, that they were obliged to implore the assistance of a military force from Augustus, in order to exterminate them. They devour herbage of all kinds, roots, grain, fruits, &c. They are in a condition for generating at the end of six months; and, like the hare, the female is almost constantly in season; she goes with young about 30 days, and brings forth from four to eight at a litter. A few days before littering, she digs a hole in the earth, not in a straight line, but in a zig-zag form: the bottom of this hole she enlarges every way, and then pulls off a great quantity of hair from her belly, of which she makes a kind of bed for her young. During the two first days after birth, she never leaves them, but when pressed with hunger, and then she eats quickly and returns: and in this manner she suckles and attends her young for six weeks. All this time both the hole and the young are concealed from the male; sometimes when the female goes out, she, in order to deceive the male, fills up the mouth of the hole with earth mixed with her own urine. But when the young ones begin to come to the mouth of the hole, and to eat such herbs as the mother brings to them, the father seems to know them: he takes them betwixt his paws, smooths their hair, and caresses them with great fondness.

3. The capensis has a tail about the length of his head, and red legs. It is a native of the Cape of Good Hope.

4. The brasiliensis has no tail. It is a native of South-America.

LEPUS, in astronomy. See there, n° 206.

LERI (John de), a Protestant minister of the province of Burgundy. He was studying at Geneva when it was reported there that Villegagnon desired they would send him some pastors into Brazil. He made

Lepus.  
Leri.

Leria  
Lefcaille.

Lefcar

made that voyage with two missionaries, whom the church of Geneva sent thither in 1556; and wrote an account of that voyage, which has been much commended by Thuanus and others.

LERIA, or LEIRIA, a strong town of Estremadura in Portugal, with a castle and bishop's see. It contains about 3,500 inhabitants, and was formerly the residence of the kings of Portugal. W. Long. 7. 50. N. Lat. 39. 40.

LERIDA, an ancient, strong, and large town of Spain, in Catalonia, with a bishop's see, an university, and a strong castle. This place declared for king Charles after the reduction of Barcelona in 1705; but it was retaken by the duke of Orleans in 1707, after the battle of Almanza. It is seated on a hill near the river Segra, and in a fertile soil, in E. Long. o. 35. N. Lat. 41. 31.

LERINS, the name of two islands in the Mediterranean Sea, lying on the coast of Provence in France, five miles from Antibes; that near the coast, called *St Margaret*, is guarded by invalids, state-prisoners being sent here. It was taken by the English in 1746, but marshal Belleisle retook it in 1747. The other is called *St Honorat*; and is less than the former, but has a Benedictine abbey.

LERMA, a town of Spain, in Old Castile, seated on the river Arlanza, with the title of a *duchy*. W. Lon. 3. 5. N. Lat. 42. 2.

LERNICA, formerly a large city in the island of Cyprus, as appears from its ruins; but is now no more than a large village, seated on the southern coast of that island, where there is a good road, and a small fort for its defence.

LERO, or LEROS, an island of the Archipelago, and one of the Sporades; remarkable, according to some authors, for the birth of Patroclus. E. Long. 26. 15. N. Lat. 37. o.

LE ROY LE VEUT, the king's assent to public bills. See the articles BILL, STATUTE, and PARLIAMENT.

LESBOS, LESSUS, or *Lesbia*, (anc. geogr.), an island on the coast of Troas and Myia, in the Hither Asia, inhabited by *Eolians*, (Scylax); taking its name from Lesbos, grandson of *Eolus*, according to *Diodorus Siculus*. In length from north to south 560 stadia; in compass, 1500. A noble and pleasant island, says *Tacitus*; famous for the fertility of its soil, the generosity of its wines, and the beauty of its women: the native place of *Sappho* the poetess. Anciently called *Lafia*, *Pelafgia*, *Agira*, *Ethiope*, and *Macaria*, (Pliny); *Lesbiur*, and *Lesbour*, the epithets, (Horace); *Lesbia regula* (Aristotle), a proverbial saying for bringing down the rule to our actions, instead of our actions up to the rule. The island is now called *Lesbor*, or *Metelin*. See METELIN.

LESCAILLE (James), a celebrated Dutch poet and printer, was born at Geneva. He and his daughter Catharine Lefcaille have excelled all the Dutch poets. That lady, who was furnished the *Sappho of Holland*, and the *tenth Muse*, died in 1711. A collection of her poems has been printed, in which are the *Tragedies* of *Genferic*, *Wenceslaus*, *Herod* and *Mariamne*, *Hercules* and *Dejaneira*, *Nicomedes*, *Arriadne*, *Callandra*, &c. James Lefcaille her father deserved the poet's crown, with which the emperor

Leopold honoured him in the year 1663: he died about the year 1677, aged 67.

LESCAR, a town of Gascony, in France, and in the territory of Bears, with a bishop's see; seated on a hill, in W. Long. o. 30. N. Lat. 43. 23.

LESKARD, a town in Cornwall, seated in a level, is a corporation, and sends to members to parliament. It had formerly a castle, now in ruins; and has a good free-school, and a considerable manufacture of yarns, which is chiefly fold at Exeter. W. Lat. 4. 45. N. Lat. 50. 34.

LESLIE (John), bishop of Rofs in Scotland, the son of Gavin Lefly an eminent lawyer, was born in the year 1526, and educated at the university of Aberdeen; of which diocese he was made official, when but a youth. He was soon after created doctor of civil and canon law; but being peculiarly addicted to the study of divinity, he took orders, and became parson of Une.

When the reformation began to spread in Scotland, and disputes about religion ran high, Dr Lefly, in 1560, distinguished himself at Edinburgh as a principal advocate for the Romish church, and was afterwards deputed by the chief nobility of that religion to console with queen Mary on the death of her husband the king of France, and to invite her to return to her native dominions. Accordingly, after a short residence with her majesty, they embarked together at Calais in 1561, and landed at Leith. She immediately made him one of her privy-council, and a senator of the college of justice. In 1564, he was made abbot of Lundoress; and, on the death of Sinclair, was promoted to the bishopric of Rofs. These accumulated honours he wished not to enjoy in luxurious indolence. The influence derived from them he exerted to the prosperity of his country. It is to him that Scotland is indebted for the publication of its laws, commonly called "The black acts of parliament," from the Saxon character in which they were printed. At his most earnest desire, the revision and collection of them were committed to the great officers of the crown.

In 1568, queen Mary having fled to England for refuge, and being there detained a prisoner, queen Elizabeth appointed certain commissioners at York to examine into the cause of the dispute between Mary and her subjects. These commissioners were met by others from the queen of Scots. The bishop of Rofs was of the number, and pleaded the cause of his royal mistress with great energy, though without success: Elizabeth had no intention to release her.

Mary, disappointed in her expectations from the conference at York, sent the bishop of Rofs ambassador to Elizabeth, who paid little attention to his complaints. He then began to negotiate a marriage between his royal mistress and the duke of Norfolk; which negotiation, it is well known, proved fatal to the duke, and was the cause of Lefly's being sent to the tower. In 1573 he was banished the kingdom, and retired to Holland. The two following years he spent in fruitless endeavours to engage the powers of Europe to espouse the cause of his queen. His last application was to the pope; but the power of the heretic Elizabeth had no less weight with his holiness, than with the other Roman catholic princes of Europe.

Lesson.  
Lessons.

rope. Finding all his personal applications ineffectual, he had recourse to his pen in queen Mary's vindication; but Elizabeth's *ultima ratio regum* was too potent for all his arguments.

Bishop Lessly, during his exile, was made coadjutor to the archbishop of Rouen. He was at Brussels when he received the account of queen Mary's execution; and immediately retired to the convent of Guirternberg near that city, where he died in the year 1596.

It was during the long and unfortunate captivity of Mary, that he amused himself in writing the history of Scotland, and his other works. The elegance and charms of literary occupations served to alluage the violence of his woes. His knowledge and judgement as an historian are equally to be commended. Where he acts as the transcriber of Boece, there may be distinguished, indeed, some of the inaccuracies of that writer. But, when he speaks in his own person, he has a manliness, a candour, and a moderation, which appear not always even in authors of the Protestant persuasion. His works are, 1. *Afflicti animi consolationes*, &c. composed for the consolation of the captive queen. 2. *De origine, moribus, et gestis Scottorum*. 3. *De titulo et jure serenissima Mariæ Scottarum regine, quo regni Angliæ successionem sibi jure vindicat*. 4. *Parænesis ad Anglos et Scottos*. 5. *De illustri feminarum in republ. administranda*, &c. 6. *Oratio ad reginam Elizabetham pro libertate impetranda*. 7. *Parænesis ad nobilitatem populumque Scotticum*. 8. An account of his proceedings during his embassy in England from 1568 to 1572; manuscript, Oxon. 9. Apology for the bishop of Rofs, concerning the duke of Norfolk; manuscript, Oxon. 10. Several letters, manuscript.

LESLIE (Charles), an Irish divine, and a zealous Protestant: but being attached to the house of Stuart, he left Ireland, and went to the pretender at Bar le Duc, and resided with him till near the time of his death; constantly endeavouring to make him a protestant, but without effect. He died in 1722. His principal works are, 1. A short and easy method with the Deists. 2. A short and easy method with the Jews. 3. The snake in the grass. 4. Hereditary right to the Crown of England asserted. 5. The Socinian controversy discussed. 6. The charge of Socinianism against Dr Tillotson considered; and many others. All his theological pieces, except that against archbishop Tillotson, were collected and published by himself, in 2 vols folio.

LESSER TONE, in music. See TONE.

LESSINES, a town of the Austrian Netherlands, in Hainaut, seated on the river Dender, and famous for its linen manufacture. W. Long. 3. 53. N. Lat. 51. 41.

LESSONS, among ecclesiastical writers, portions of the holy scripture, read in Christian churches, at the time of divine service.

In the ancient church, reading the scriptures was one part of the service of the catechumens; at which all persons were allowed to be present, in order to obtain instruction.

The church of England, in the choice of lessons, proceeds as follows: for the first lesson on ordinary days, the directs, to begin at the beginning of the year with Genesis, and to continue on, till the books

Vol. VI.

of the old Testament are read over; only omitting the Chronicles, which are for the most part the same with the books of Samuel and Kings, and other particular chapters in other books, either because they contain names of persons, places, or other matters less profitable to ordinary readers.

The course of the first lessons for Sundays is regulated after a different manner. From Advent to Septuagesima-Sunday, some particular chapters of Isaiah are appointed to be read, because that book contains the clearest prophecies concerning Christ. Upon Septuagesima-Sunday Genesis is begun, because that book which treats of the fall of man, and the severe judgement of God inflicted on the world for sin, best suits with a time of repentance and mortification. After Genesis, follow chapters out of the books of the Old Testament, as they lie in order; only on festival Sundays, such as Easter, Whitunday, &c. the particular history relating to that day is appointed to be read; and on the Saints-days, the church appoints lessons out of the moral books, such as Proverbs, Ecclesiastes, Ecclesiasticus, &c. as containing excellent instructions for the conduct of life.

As to the second lessons, the church observes the same course both on Sundays and week-days: reading the gospels and Acts of the Apostles in the morning, and the epistles in the evening, in the order they stand in the New Testament: excepting on saints days and holy-days, when such lessons are appointed as either explain the mystery, relate the history, or apply the example to us.

LESTOFF, or LEOSTOFF, a town of Suffolk, in England, seated on the sea-shore, is concerned in the fisheries of the North-sea, cod, herrings, mackerels, and sprats; has a church, and a dissenting meeting-house; and for its security, fix 18-pounders, which they can move as occasion requires; but it has no battery. The town consists of 500 houses; but the streets, though tolerably paved, are narrow. The coast is there very dangerous for strangers. E. Long. 1. 45. N. Lat. 52. 37.

L'ESTRANGE (Sir Roger), a noted writer in the 17th century, was descended from an ancient family, seated at Hunstanton hall in the county of Norfolk, where he was born in 1616, being the youngest son of Sir Hammond L'Estrange baronet, a zealous royalist. Having in 1644 obtained a commission from king Charles I. for reducing Lynn in Norfolk, then in possession of the parliament, his design was discovered, and his person seized. He was tried by a court martial at Guildhall in London, and condemned to die as a spy; but was reprieved, and continued in Newgate for some time. He afterward went beyond sea; and in August 1653 returned to England, where he applied himself to the protector Oliver Cromwell, and having once played before him on the bass-viol, he was by some nicknamed *Oliver's fiddler*. Being a man of parts, master of an easy humorous style, but withal in narrow circumstances, he set up a newspaper, under the title of *The public intelligence*, in 1663; but which he laid down, upon the publication of the first London gazette in 1665, having being allowed, however, a consideration by government. Some time after the Popish plot, when the Tories began to gain the ascendant over the Whigs, he, in a paper called

Lesson.  
L'Estrange.

**Lestweithel** the *Observator*, became a zealous champion for the former. He was afterward knighted, and served in the parliament called by king James II. in 1685. But things taking a different turn in that prince's reign, in point of liberty of conscience, from what most people expected, our author's *Observators* were disused as not at all suiting the times. However, he continued licenter of the press till king William's accession, in whose reign he met with some trouble as a disaffected person. However, he went to his grave in peace, after he had in a manner survived his intellectuals. He published a great many political tracts, and translated several works from the Greek, Latin, and Spanish: viz. Josephus's works, Cicero's Offices, Seneca's Morals, Erasmus's Colloquies, Æsop's Fables, and Bonas's Guide to Eternity. The character of his style has been variously represented; his language being observed by some to be easy and humorous, while Mr Gordon says, "that his productions are not fit to be read by any who have taste or good-breeding. They are full of phrases picked up in the streets, and nothing can be more low or nauseous."

**LESTWEITHEL**, a town of Cornwall, in England, seated on the river Foy, not far from its fall into Foy-haven. Formerly ships came as far up as the town; but the channel is now stopped up. It is a corporation, and sends two members to parliament. They also keep courts here belonging to the flannery; and the county-gaol is likewise here. It is conveyed by a mayor, 6 capital burgesses, and 17 common-council men. The town consists of about 100 houses; but the streets, though paved, are bad. W. Long, 5. o. N. Lat. 50. 30.

**LETHARGY**. See (*Index* subjoined to) MEDICINE.

**LETHARGY**, in farristry. See there, § 9.

**LETHE**, in the ancient mythology, one of the rivers of hell, signifying oblivion or forgetfulness; its waters having, according to poetic fiction, the peculiar quality of making those who drank them forget every thing that was past.

**LETTI** (Gregorio), an eminent Italian writer, was descended of a family which once made a considerable figure at Bologna: Jerom, his father, was page to prince Charles de Medicis; served some time in the troops of the grand duke as captain of foot; and settling at Milan, married there in 1628. He was afterward governor of Almontea in Calabria, and died at Salerno in 1639. Our author was born at Milan in 1630, studied under the Jesuits at Colenza, and was afterward sent by an uncle to Rome, who would have him enter into the church; but he being averse to it, went to Geneva, where he studied the government and the religion there. Thence he went to Lausanne; and contracting an acquaintance with John Anthony Guerin, an eminent physician, lodged at his house, made profession of the Calvinist religion, and married his daughter. He settled at Geneva; where he spent almost twenty years, carrying on a correspondence with learned men, especially those of Italy. Some contests obliged him to leave that city in 1679; upon which he went to France, and then into England, where he was received with great civility by Charles II. who, after his first audience, made him a present of a thousand crowns, with a promise of the

place of historiographer. He wrote there the history of England; but that work not pleasing the court on account of his too great liberty in writing, he was ordered to leave the kingdom. He went to Amsterdam in 1682, and was honoured with the place of historiographer to that city. He died suddenly in 1701. He was a man of indefatigable application, as the multiplicity of his works show. The principal of these are, 1. The nepotism of Rome. 2. The universal monarchy of Lewis XIV. 3. The life of pope Sixtus V. 4. The life of Philip II. king of Spain. 5. The life of the emperor Charles V. 5. The life of Elizabeth, queen of England. 7. The history of Oliver Cromwell. 8. The history of Great Britain, 5 vols, 12mo. 9. The history of Geneva, &c.

**LETRIM**, a county of Ireland, in the province of Connaught, 44 miles in length, and 17 in breadth; bounded on the east and north-east by Cavan and Fermanagh, by Sligo and Roscommon on the west and south-west, and by Longford on the east and south-east. It is a hilly country, with rank grass, which feeds a great number of cattle. The chief town is Letrim, seated not far from the river Shannon. It contains 4000 houses, 21 parishes, 5 baronies, 2 boroughs, and sends 6 members to parliament.

**LETTER**, a character used to express one of the simple sounds of the voice; and as the different simple sounds are expressed by different letters, these, by being differently compounded, become the visible signs or characters of all the modulations and mixtures of sounds used to express our ideas in a regular language. Thus, as by the help of speech we render our ideas audible; by the assistance of letters we render them visible, and by their help we can wrap up our thoughts, and send them to the most distant parts of the earth, and read the transactions of different ages. As to the first letters, what they were, who first invented them, and among what people they were first in use, there is still room to doubt: Philo attributes this great and noble invention to Abraham; Josephus, St Irenæus, and others, to Enoch; Bibliander, to Adam; Eusebius, Clemens Alexandrinus, Cornelius Agrippa, and others, to Moses; Pomponius Mela, Herodian, Rufus Festus, Pliny, Lucan, &c. to the Phœnicians; St Cyprian, to Saturn; Tacitus, to the Egyptians; some, to the Ethiopians; and others, to the Chinese: but, with respect to these last, they can never be entitled to this honour, since all their characters are the signs of words, formed without the use of letters; which renders it impossible to read and write their language, without a vast expence of time and trouble; and absolutely impossible to print it by the help of types, or any other manner but by engraving, or cutting in wood. See PRINTING.

There have also been various conjectures about the different kinds of letters used in different languages: thus, according to Crinitus, Moses invented the Hebrew letters; Abraham, the Syriac and Chaldee; the Phœnicians, those of Attica, brought into Greece by Cadmus, and from thence into Italy by the Pelasgians; Nicotratra, the Roman; Isis, the Egyptian; and Vulfilas, those of the Goths.

It is probable, that the Egyptian hieroglyphics were the first manner of writing; but whether Cadmus and the Phœnicians learned the use of letters from the

Letrim, Letter.

Egyptians, or from their neighbours of Judea or Samaria, is a question; for since some of the books of the Old Testament were then written, they are more likely to have given them the hint, than the hieroglyphics of Egypt. But whereforever the Phœnicians learned this art, it is generally agreed, that Cadmus, the son of Agenor, first brought letters into Greece; whence, in following ages, they spread over the rest of Europe.

Letters make the first part or elements of grammar; an assemblage of these compose syllables and words, and these compose sentences. The alphabet of every language consists of a number of letters, which ought each to have a different sound, figure, and use. As the difference of articulate sounds was intended to express the different ideas of the mind, so one letter was originally intended to signify only one sound, and not, as at present, to express sometimes one sound and sometimes another; which practice has brought a great deal of confusion into the languages, and rendered the learning of the modern tongues much more difficult than it would otherwise have been. This consideration, together with the deficiency of all the known alphabets, from their wanting some letters to express certain sounds, has occasioned several attempts towards an universal alphabet, to contain an enumeration of all such single sounds or letters as are used in any language. See ALPHABET.

Grammarians distinguish letters into vowels, consonants, mutes, liquids, diphthongs, and characteristics. They are likewise divided into capital and small letters. They are also denominated from the shape and turn of the letters; and in writing are distinguished into different hands, as round-text, German-text, round-hand, Italian, &c. and in printing, into roman, italic, and black letter.

The term *LETTER*, or *type*, among printers, not only includes the CAPITALS, SMALL CAPITALS, and small letters, but all the points, figures, and other marks cast and used in printing; and also the large ornamental letters, cut in wood or metal, which take place of the illuminated letters used in manuscripts. The letters used in printing are cast at the ends of small pieces of metal, about three quarters of an inch in length; and the letter being not indented, but raised, easily gives the impression, when, after being blacked with a glutinous ink, paper is closely pressed upon it. See the articles PRINTING and TYPES. A fount of letters includes small letters, capitals, small capitals, points, figures, spaces, &c. but besides they have different kinds of two-lined letters, only used for titles, and the beginning of books, chapters, &c. See FOUNT.

*LETTER*, is also a writing addressed and sent to a person. See EPISTLE.

The art of epistolary writing, as the late translator of Pliny's Letters has observed, was esteemed by the Romans in the number of liberal and polite accomplishments; and we find Cicero mentioning with great pleasure, in some of his letters to Atticus, the elegant specimen he had received from his son, of his genius in this way. It seems indeed to have formed part of their education; and, in the opinion of Mr Locke, it well deserves to have a share in ours. "The writing of letters (as that judicious author observes)

"enters so much into all the occasions of life, that no gentleman can avoid shewing himself in compositions of this kind. Occurrences will daily force him to make this use of his pen, which lays open his breeding, his sense, and his abilities, to a fever examination than any oral discourse." It is to be wondered we have so few writers in our own language, who deserve to be pointed out as models upon such an occasion. After having named Sir William Temple, it would perhaps be difficult to add a second. The elegant writer of Cowley's life mentions him as excelling in this uncommon talent; but as that author declares himself of opinion, "That letters which pass between familiar friends, if they are written as they should be, can scarce ever be fit to see the light," the world is deprived of what, no doubt, would have been well worth its inspection. A late distinguished genius treats the very attempt as ridiculous, and professes himself "a mortal enemy to what they call a fine letter." His aversion however was not so strong, but he knew to conquer it when he thought proper; and the letter which closes his correspondence with bishop Atterbury is, perhaps, the most genteel and manly address that ever was penned to a friend in disgrace. The truth is, a fine letter does not consist in saying fine things, but in expressing ordinary ones in an uncommon manner. It is the *proprie communia dicere*, the art of giving grace and elegance to familiar occurrences, that constitutes the merit of this kind of writing. Mr Gay's letter, concerning the two lovers who were struck dead with the same flash of lightning, is a master-piece of the sort; and the specimen he has there given of his talents for this species of composition makes it much to be regretted we have not more from the same hand.

*Of the Style of Epistolary Composition.* Purity in the choice of words, and justness of construction, joined with perspicuity, are the chief properties of this style. Accordingly Cicero says: "In writing letters, we make use of common words and expressions." And Seneca more fully: "I would have my letters to be like my discourses, when we either sit or walk together, unstudied and easy." And what prudent man, in his common discourse, aims at bright and strong figures, beautiful turns of language, or laboured periods? Nor is it always requisite to attend to exact order and method. He that is master of what he writes, will naturally enough express his thoughts without perplexity and confusion; and more than this is seldom necessary, especially in familiar letters.

Indeed, as the subjects of epistles are exceedingly various, they will necessarily require some variety in the manner of expression. If the subject be something weighty and momentous, the language should be strong and solemn; in things of a lower nature, more free and easy; and upon lighter matters, jocose and pleasant. In exhortations, it ought to be lively and vigorous; in consolations, kind and compassionate; and in advising, grave and serious. In narratives, it should be clear and distinct; in requests, modest; in commendations, friendly; in prosperity cheerful, and mournful in adversity. In a word, the style ought to be accommodated to the particular nature of the thing

Warr's  
Oratory.

Letter. about which it is conversant.

Besides, the different character of the person, to whom the letter is written, requires a like difference in the modes of expression. We do not use the same language to private persons, and those in a public station; to superiors, inferiors, and equals. Nor do we express ourselves alike to old men and young, to the grave and facetious, to courtiers and philosophers, to our friends and strangers. Superiors are to be addressed to with respect, inferiors with courtesy, and equals with civility; and every one's character, station, and circumstances in life, with the relation we stand in to him, occasions some variety in this respect. But when friends and acquaintances correspond by letters, it carries them into all the freedom and good-humour of conversation; and the nearer it resembles that the better, since it is designed to supply the room of it. For when friends cannot enjoy each others company, the next satisfaction is to converse with each other by letters. Indeed, sometimes greater freedom is used in epistles, than the same persons would have taken in discoursing together; because, as Cicero says, "A letter does not blush." But still nothing ought to be said in a letter, which, considered in itself, would not have been fit to say in discourse; though modesty perhaps, or some other particular reason, might have prevented it. And thus it frequently happens in requests, reproofs, and other circumstances of life. A man can ask that by writing, which he could not do by words, if present; or blame what he thinks amiss in his friend with greater liberty when absent, than if they were together. From hence it is easy to judge of the fitness of any expression to stand in an epistle, only by considering, whether the same way of speaking would be proper in talking with the same person. Indeed, this difference may be allowed, that as persons have more time to think, when they write, than when they speak; a greater accuracy of language may sometimes be expected in one, than the other. However, this makes no odds as to the kind of style; for every one would choose to speak as correctly as he writes, if he could. And therefore all such words and expressions, as are unbecoming in conversation, should be avoided in letters; and a manly simplicity free of all affectation, plain, but decent and agreeable, should run through the whole. This is the usual style of Cicero's epistles, in which the plainness and simplicity of his diction, is accompanied with something so pleasant and engaging, that he keeps up the attention of his reader, without suffering him to tire. On the other hand, Pliny's style is succinct and witty; but generally so full of turns and quibbles upon the sound of words, as apparently render it more stiff and affected than agrees with conversation, or than a man of sense would choose in discourse, were it in his power. You may in some measure judge of Pliny's manner, by one short letter to his friend, which runs thus: "How fare you? As I do in the country? pleasantly? that is, at leisure? For which reason I do not care to write long letters, but to read them; the one as the effect of idleness, and the other of idleness. For nothing is more idle than your nice folks, or curious than your idle ones. Farewell." Every sentence here consists of an antithesis, and a jingle of words, very

different from the style of conversation, and plainly the effect of study. But this was owing to the age in which he lived, at which time the Roman eloquence was sunk into puns, and an affectation of wit; for he was otherwise a man of fine sense, and great learning.

LETTER of Attorney, in law, is a writing by which one person authorizes another to do some lawful act in his stead; as to give seisin of lands, to receive debts, sue a third person, &c.

The nature of this instrument is to transfer to the person to whom it is given, the whole power of the maker, to enable him to accomplish the act intended to be performed. It is either general or special: and sometimes it is made revocable, which is when a bare authority is only given; and sometimes it is irrevocable, as where debts, &c. are assigned from one person to another. It is generally held, that the power granted to the attorney must be strictly pursued; and that where it is made to three persons, two cannot execute it. In most cases, the power given by a letter of attorney determines upon the death of the person who gave it. No letter of attorney made by any seaman, &c. in any ship of war, or having letters of marque, or by their executors, &c. in order to empower any person to receive any share of prizes or bounty-money, shall be valid, unless the same be made revocable, and for the use of such seamen, and be signed and executed before, and attested by, the captain and one other of the signing officers of the ship, or the mayor or chief magistrate of some corporation.

LETTER of Mart, or Marque. See MARQUE.

LETTERS Patent, or Overt, are writings sealed with the great seal of England, whereby a man is authorized to do, or enjoy any thing, which, of himself, he could not do. See PATENT.—They are so called, by reason of their form; as being open, with the seal affixed, ready to be shewn for the confirmation of the authority given by them.

LETTUCE, in botany. See LACTUCA.

LEVANT, in geography, signifies any country situated to the east of us, or in the eastern side of any continent or country, or that on which the sun rises.

LEVANT, is also a name given to the eastern part of the Mediterranean sea, bounded by Naticia or the lesser Asia on the north, by Syria and Palestine on the east, by Egypt and Barca on the south, and by the island of Candia and the other part of the Mediterranean on the west.

LEVATOR, in anatomy, a name given to several muscles. See ANATOMY, Table of the Muscles.

LEUCA, in antiquity, a geographical measure of length in use among the later Gauls; which according to Jornandes, who calls it *Leuga*, contained fifteen hundred paces, or one mile and a half. Hence the name of *league*, now reckoned at three miles. In the lower age called *leuva*.

LEUCADIA, formerly called *Neritis*, and a peninsula of Acarnania, (Homer); but afterwards, by cutting through the peninsula, made an island, as it is at this day; called *St Maura*.

LEUCAS, (anc. geog.), formerly called *Neritos* and *Neritum*, a town of Leucadia or Leucas; situated near a narrow neck of land, or isthmus, on a hill facing the east and Acarnania: the foot or lower part of the town was a plain lying on the sea by which

Leu.

Letter  
Leucas.

Leucadia was divided from Acarnania, (Livy); though Thucydides places *Leucas* more inward in the Island, which was joined to the continent by a bridge. It was an illustrious city, the capital of Acarnania, and the place of general assembly.

LEUCATA or LEUCATE, (anc. geog.); a promontory of Leucadia according to Strabo, a white rock projecting into the sea towards Cephalenia, on which stood a temple of Apollo surnamed *Leucadius*. This place was famous for being the last resource of despairing lovers; from which they took a leap into the sea, as Sappho is said to have done.
